REPORT
OF THE
INDUSTRIAL COMMISSION
ON THE RELATIONS AND CONDITIONS OF
CAPITAL AND LABOR
EMPLOYED IN THE
MINING INDUSTRY,
INCLUDING
TESTIMONY, REVIEW OF EVIDENCE, AND TOPICAL DIGEST.

VOLUME XII
OF THE COMMISSION'S REPORTS.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1901.

A. 156932
MEMBERS OF THE INDUSTRIAL COMMISSION.

Mr. ALBERT CLARKE, *Chairman*.

Senator BOIES PENROSE.
Senator STEPHEN R. MALLORY.
Senator JOHN W. DANIEL.
Senator THOMAS R. BARD.
Representative JOHN J. GARDNER.
Representative L. F. LIVINGSTON.
Representative JOHN C. BELL.
Representative THEOBALD OTJEN.
Mr. WILLIAM LORIMER.

Mr. ANDREW L. HARRIS.
Mr. JOHN M. FARQUHAR.
Mr. EUGENE D. CONGER.
Mr. THOMAS W. PHILLIPS.
Mr. CHARLES J. HARRIS.
Mr. JOHN L. KENNEDY.
Mr. D. A. TOMPKINS.
Mr. CHARLES H. LITCHMAN.

E. DANA DURAND, *Secretary*.

[Extract from act of Congress of June 18, 1898, defining the duties of the Industrial Commission and showing the scope of its inquiries.]

SEC. 2. That it shall be the duty of this commission to investigate questions pertaining to immigration, to labor, to agriculture, to manufacturing, and to business, and to report to Congress and to suggest such legislation as it may deem best upon these subjects.

SEC. 3. That it shall furnish such information and suggest such laws as may be made a basis for uniform legislation by the various States of the Union, in order to harmonize conflicting interests and to be equitable to the laborer, the employer, the producer, and the consumer.

INDUSTRIAL COMMISSION,
December 4, 1901.

To the Fifty-seventh Congress:

I have the honor to transmit herewith on behalf of the Industrial Commission a report on the Relations and Conditions of Capital and Labor in the Mining Industry, prepared in pursuance of an act of Congress approved June 18, 1898.

The conclusions and recommendations of the Commission on this subject will be submitted in its general final report.

Respectfully,

ALBERT CLARKE, *Chairman.*

REVIEW OF EVIDENCE.

The following review of evidence covers the testimony taken before the Industrial Commission and its subcommission on mining. Most of the testimony regarding the conditions of capital and labor in coal mining in the Eastern States was taken at Washington in 1899, but additional statements of one or two leading representatives of the employers and employees of this industry were secured in 1901. A considerable amount of testimony regarding the alleged combinations of railroads entering the anthracite coal field was also taken in 1901, and is printed in the volume on transportation¹ (vol. ix, pp. 451-610). Reference should also be made to the special report on Labor Organizations, Strikes, and Arbitration (vol. xvii), for a description of the organizations of miners and of the system of joint agreements prevailing in the industry. Testimony relating to the conditions of mining in the Rocky Mountain States was taken chiefly by a subcommission which visited Colorado, Utah, and Idaho during the summer of 1899. This subcommission also took a large amount of testimony regarding the riot in the Cœur d'Alene region in April, 1899, and the subsequent events there.

CAPITAL EMPLOYED IN MINING—WESTERN STATES.

Testimony regarding the conditions of mine labor in the Western States was given especially by Mr. Coates, president of the Colorado Federation of Labor; Mr. Clark, a member of the Western Federation of Labor and a coal miner; Mr. Smith, deputy commissioner of labor of Colorado; Mr. Sullivan, a precious metal miner of Colorado; Mr. Wright, of the Smeltermen's Union, Denver; Mr. Callis, a coal miner of Utah; and Mr. Thomas, coal-mine inspector of Utah. The witnesses first above named, who testified regarding the conditions of the mining industry generally, also discussed labor questions.

General conditions of the precious-metal mining industry.—Representatives of the precious-metal mines and smelters of Colorado, Utah, and Idaho testifying in 1899 agreed in stating that the general conditions of the mining industry in those States at that time were decidedly prosperous. While several witnesses expressed the opinion that, on account of the uncertainty of discoveries, more capital has been put into the ground than the value of the product heretofore extracted, the general opinion seemed to be that the mining business is becoming a more certain one. The possibility of profitable mining, notwithstanding the great decrease in the price of silver during the past 30 years, has resulted largely, according to the statements of these witnesses, from great improvements in the methods of mining, and particularly in the methods of extracting metals from ores.² Mr. Hanauer especially states that the silver mines in Utah are making more money with silver selling at 60 cents than when it was 90 cents, and Mr. Grant makes a somewhat similar statement.

¹ The review of that evidence is reprinted at the end of this review.

² Grant, pp. 192-195; Lee, pp. 237, 241; Hill, pp. 370, 380, 381; Hanauer, pp. 606, 608, 616; Allen, p. 568; Chambers, pp. 580, 588; Terhune, pp. 590, 596, 597; Burbidge, pp. 458, 459.

Several witnesses referred to the great improvement in the machinery used in mining, and especially to the increased use of electric machinery. They believed that the demand for labor had rather been increased than decreased by the use of machinery, because of the extension of mining operations¹

A further reason why mining of precious metals has become more profitable was said to be the increased production of gold, lead, copper, and other metals which are found in connection with silver, and the more effective extraction of which makes possible the mining of much lower grade ores than formerly.²

The extraction of silver and other precious metals from ores is accomplished either by stamping mills, in which the ore is crushed and the precious metals washed out; by smelting works, in which the metals are obtained by processes of melting; or by what is known as the "cyanide process." The smelting process, which is of comparatively recent introduction, made it possible, according to statements of smelter operators and one or two other witnesses, to handle profitably grades of ores that could not be used to advantage under the stamping process. By smelting especially all the different metals in the ores are extracted. Constant improvements are being made in the processes of smelting, while the practice of concentrating ores at the place of mining, in order to decrease the weight which must be shipped to the smelting works, has also increased the profitableness of mining operations. Moreover, the establishment of local smelters in the leading mining districts has resulted in economy as compared with earlier times when it was necessary to ship ores long distances to the few existing smelters.³

The charges for smelting were, in 1899, in the opinion of Mr. Hill and Mr. Grant, reasonable. Indeed, it was maintained that prior to the combination of smelters into the American Smelting and Refining Company in that year the charges were often unprofitably low. It was claimed by these witnesses that the improvements in processes of reduction have for the most part gone to benefit the mine owners. One witness, Mr. Doyle, complained of discrimination in the charges of a certain smelter in favor of another mine as compared with his own, and believed that, out of the charge to his mine, somebody got a rebate.⁴

*The American Smelting and Refining Company.*⁵—At the time when the Industrial Commission took testimony in Colorado and other Western States, July, 1899, a combination known as the American Smelting and Refining Company had very recently been formed. It was incorporated in the State of New Jersey with a capitalization of about \$55,000,000. It included, according to the testimony of its manager, Mr. Grant, 7 smelters in Colorado and others in Salt Lake City and Omaha. Another witness believed that the combination included 3 smelters in Utah, 2 in Omaha, and 1 in Kansas City, besides those in Colorado. Mr. Hanauer and Mr. Terhune, who sold out a smelter at Salt Lake City, expressed the opinion that the combination was greatly overcapitalized, stating that much more was paid for the Salt Lake City plants than they cost. The manager of the combination admitted that its preferred stock covered the value of its plants and that the common stock was bonus.⁶

The manager of the company asserted that its formation was caused primarily by the ruinous competition which had existed. It was expected that various economies could be secured by more favorable location of plants, by control of different classes of ore for proper combination in smelting, and by other improvements. This witness and two or three others expressed the belief that the combination would not increase charges for smelting unfairly or otherwise result in injury to mine owners. There was still at this time (1899), as was pointed out, a considerable degree of competition.

³ Hill, pp. 370, 374, 375, 379, 380, 381; Allen, p. 563; Newhouse, p. 298.

⁴ Hill, p. 370; Doyle, p. 367; Grant, p. 197.

⁵ See also testimony on this subject in Reports of Industrial Commission, vol. xiii, pp. 92-99.

⁶ Grant, p. 195; Coates, pp. 253, 254; Lee, p. 238. Hanauer, pp. 613, 614; Terhune, p. 600.

One witness claimed that the firm of M. Guggenheim & Sons, which owned smelters in Mexico, New Jersey, and one very large plant in Colorado, had a capital back of it considerably greater than that of the American Smelting and Refining Company. It was also maintained that if the combination attempted to close favorably situated plants and to raise charges new competitors would soon come in, especially since smelters must be located in numerous places, convenient to ore.¹

Mr. Chambers, however, a mine operator, feared that the combination would probably possess considerable power to dictate the price of ores, that it would be likely to discriminate between different producers, and that by dismantling some of its works it would injure various communities.²

The manager of the combination expressed the hope that it might be able to secure more favorable marketing of the silver and lead which it produces than the small separate plants could do. It could especially withhold its product during times of low prices, selecting the most favorable times for disposing of it.³

Two or three witnesses expressed the opinion that the formation of the combination was likely to result in the injury of labor, particularly through the closing of certain plants, by which men would be forced to leave their homes and, in many cases, to change their employment.⁴ Others maintained, however, that men already displaced by the closing of plants had found, and that others would in the future be able to find, employment in other smelters, and that no injury to labor would arise from the combination.⁵

Conditions in the coal and iron industries in Colorado and Utah.—Coal-mine operators and other witnesses in Colorado and Utah spoke of the very large areas in those States which are underlain with coal, and of the thickness of the veins. The Utah coal is said to be of rather low grade. There has been a rapid increase in the industry, and it was reported in 1899 to be generally prosperous. Coal is sold for the most part for steam and domestic uses in the Rocky Mountain States, a little going also to California.⁶

It is asserted that most of the coal mines of Utah are affiliated with the railroads, and that the freight rates on coal are very high. The coal mine inspector of Utah said that it costs from \$1.75 to \$2 to haul a ton of coal 80 or 90 miles in Utah.⁷

Mr. Beaman, manager of the Colorado Fuel and Iron Company, testified in detail regarding that corporation. It was formed in 1892 by the combination of 2 large companies and 2 or 3 smaller ones, between which there had been sharp competition. The combination had, in 1899, 11 coal mines in Colorado in operation, 7 not in operation, 2 coke plants in New Mexico, 4 iron mines in Colorado, New Mexico, and Wyoming, and steel plants at Bessemer, Colo. It employed about 6,000 miners and produced in 1898 2,630,000 tons of coal and 322,000 tons of coke. This witness denied that the capital stock of the company, \$13,000,000,⁸ included any "water," especially if the value of its 70,000 acres of land be properly estimated. The company had, up to 1899, paid only one dividend on its common stock, in 1893.

It was further stated by this witness that the combination had checked extreme competition and price cutting, although he maintained that consumers had not been injured. Considerable economies had been introduced by the consolidation. There were still, it was stated, numerous small competing coal mines, and the witness believed that they were increasing in number.⁹

¹ Lee, pp. 238, 241; Grant, p. 194; Hanauer, pp. 612-615. Since this testimony was taken there has been a combination between the American Smelting and Refining Company and the Guggenheim concern.

⁷ Sharp, p. 643; Thomas, p. 624.

⁸ The company has also a funded debt of \$6,942,000; and the stock was increased in 1899 and 1900 to \$21,000,000 preferred and \$17,000,000 common, various new works being undertaken.

⁹ Beaman, pp. 261-270, 272, 294.

Petroleum industry of Colorado.—Testimony on the petroleum industry in Colorado was submitted in 1899 by ex-Senator Hill, who is engaged in oil refining, and Mr. Johnston, a crude-oil producer. It appears from the testimony that several years ago a number of small oil-refining companies in Colorado combined into the United Oil Company. They found the Continental Oil Company, a branch of the Standard Oil Company, in the field as a distributor of oil. Through its influence with the railroads the Continental Company would have been able, in the opinion of Mr. Hill, to crush out all competition. Accordingly, the United Oil Company entered into an arrangement to make the Continental Company its selling agent for all oil. The latter company paid the Chicago wholesale price plus the freight from Chicago. Other independent competitors, it was stated, have been crushed out by the Continental Oil Company. Thus in 1896 the Rocky Mountain Oil Company built large works at Overton, but prices were sharply cut by the Continental Oil Company for the purpose of driving out the new concern, and after a short time it was compelled to give up the refining business. Mr. Johnston stated that at this time the retail price of oil at Florence, Colo., was cut from about 20 cents a gallon to 5 cents a gallon. At the time of his testimony, this witness asserted, the Standard Oil Company produced no crude oil in Colorado, but bought the entire refined product of all other concerns. The retail prices were at that time about the same as before. Mr. Hill believed that the retail prices were excessive as compared with prices paid to the refining companies. The crude-oil producers, Mr. Johnston held, were benefited by the arrangement with the Continental Company, securing a steady market at a fixed price. This witness believed that there had been discriminations in freight rates in the West in favor of the Standard Company. The Rocky Mountain Oil Company had to pay \$1.87 to ship oil from Colorado to the Pacific coast, while the Standard Oil Company shipped it from Whiting, Ind., to the coast for 87½ cents. Mr. Johnston also referred to the operation of the Standard Oil Company in Eastern States, holding in general that it had proved beneficial to the public.¹

CONDITIONS OF MINE LABOR IN THE WEST.

Testimony regarding the general conditions of the mining industry of the Western States was presented especially by Mr. Grant, ex-governor of Colorado, and manager of the Grant Smelter of the American Smelting and Refining Company at Denver; by ex-Senator Hill, oil operator and manager of the Argo Smelter; by Mr. Hanauer and Mr. Terhune, both formerly connected with the Hanauer Smelter at Salt Lake City and with precious metal mining interests there; by Messrs. Allen and Chambers, metal mine operators of Utah; by Mr. Lee, precious-metal mine inspector of Colorado; by Mr. Beaman, of the Colorado Fuel and Iron Company; by Mr. Sharp, a Utah coal operator, and by Mr. Newhouse, of the Philadelphia Smelting and Refining Company of Pueblo.

Labor organizations in the Mountain States.—It appears from the testimony that a considerable proportion of the miners in the precious-metal mines of Colorado, Idaho, and Montana are connected with labor organizations. The Western Federation of Miners included in 1899 about 16,000 members. Many of the local unions of the miners' federation in Colorado are also affiliated with the State Federation of Labor. One witness estimated in 1899 that 70 per cent of the precious-metal miners in Colorado were organized.²

In Utah, however, several witnesses testified, very few labor organizations at that time (1899) existed among either metal miners or coal miners. Little definite evidence was given regarding the nature of the labor organizations among Colorado coal miners although one witness stated that nearly all of them were organized.³ It appears also

¹ Hill, pp. 375, 376, 385-387; Johnston, pp. 338-346.

² Coates, p. 245; Smith, pp. 211-213; Sullivan, p. 347; Clarke, p. 322.

³ Thomas, pp. 623, 627, 629; Callis, p. 634; Chambers, pp. 584, 586, 587; Sharp, p. 640; Terhune, p. 596.

that the smeltermen have not been long organized, the great strike in the smelters during 1899 having been conducted by a newly formed organization.¹

Mine operators and smelter operators testifying before the Industrial Commission appeared generally to agree that labor organizations among the miners, especially in the precious-metal mines, had been frequently unreasonable in their demands, and even lawless and violent in their actions. These witnesses complained especially of the control which a few unprincipled leaders exercised over the great body of the miners. Objection was also made to the attempt to exclude nonunion men from the mines—often by violence. Two or three of these witnesses denounced labor unions in general as injurious to employers and labor alike. Others, however, believe that, if properly conducted, labor organizations might prove beneficial.²

The various representatives of the miners' organizations who testified before the Commission did not attempt to disprove in detail the charges of lawlessness among miners. They did maintain that labor organizations were necessary for the protection of the rights of the miners, and that they had resulted in material advantage as regards wages and conditions of labor. Two or three witnesses asserted that the general inclination of organized workingmen was against all forms of lawlessness.³ In particular, they denied that the Western Federation of Miners had any disposition to coerce or intimidate nonunion men. The policy of the organization, it was asserted, is to persuade them by peaceful methods to join the union. Many nonunion men recognize the advantages which accrue to themselves from the existence of labor organizations.⁴

More detailed evidence regarding the actions of labor organizations in the Cœur d'Alene district is summarized below.

The representative of the Colorado Fuel and Iron Company, as well as Mr. Hill and Mr. Grant, representatives of two of the large smelters of Colorado, declared that they did not raise the question as to whether a man belonged to the union or not. They had never recognized unions nor dealt with their representatives. During the great smelters' strike of 1899 the American Smelting and Refining Company refused to deal with the union of smelter workers as such.⁵

Strikes and lockouts among Western miners.—Reference was made by various witnesses to a number of strikes, some of considerable importance, among the metal miners of Colorado. The representative of the Colorado Fuel and Iron Company asserted that practically no strikes had been directed against that company, although in 1894 some of the miners struck in sympathy with a general strike of miners in northern Colorado. Another extensive strike occurred in the northern coal mines in 1898-99. Two or three small strikes in Utah were referred to, but the general consensus of evidence was that strikes among miners in that State have been very few and unimportant.⁶ Two representatives of miners' unions admitted that the common opinion was that miners are more ready to strike than most other classes of employees, but they denied that this opinion was well-founded, although one suggested that the nature of the industry was such as to give rise to frequent causes of disagreement.⁷

Several witnesses, representing the employers, declared that in the inauguration and conduct of strikes among miners agitators play a large part; that they often foment disputes which the majority of the miners scarcely approve. It was also asserted that violence toward men seeking employment during strikes, and destruction of property, are frequent accompaniments of labor disputes.⁸ Representatives

⁸ Lee, pp. 228-231; Grant, p. 208.

of the miners' organizations, however, declared that strikes can ordinarily be instituted only after a secret vote of the members of the unions, and that it is impossible for a few leaders to inaugurate strikes against the will of the rank and file. These witnesses also denied any disposition to lawlessness on the part of the unions as such, and declared that they endeavor to secure peaceful negotiations with employers, and thus to effect a settlement of disputes. Committees, it was said, are also sometimes appointed to interview men seeking employment during strikes and inform them as to the true state of affairs.¹

Several labor men asserted that mine operators have imported laborers, colored and white, from Eastern States for the purpose of defeating strikes. This was done especially in connection with the strike at Leadville in 1896, and with the strike of miners in the northern coal district of Colorado in 1898. The laborers so imported, it was claimed, are often induced to come by misrepresentations; they are not informed of the existence of a strike. These imported laborers also are of the lowest class and tend to force down the standard of living of other workmen. Representatives of employers did not deny the existence of this practice of importing labor in Colorado, Mr. Grant especially asserting that it has frequently been resorted to. No complaint regarding importation of labor for work in smelters or in other States than Colorado was made.²

Two witnesses, representing Colorado miners, referred to the issuing of injunctions to restrain acts of strikers. During the northern coal strike of 1898, it was said, an injunction was issued to restrain men from congregating in numbers or from going upon the property of the employers. These witnesses denounced the use of injunctions under such circumstances.³

At the time when the subcommission took testimony in Colorado in 1899 a strike was in force against the American Smelting and Refining Company. It appears from the statements of witnesses on both sides that the immediate occasion of the strike was the fact that the 8-hour law was to go into effect June 15, 1899. The company proposed to pay practically the same rate of wages per hour under the 8-hour day as had been paid when the men worked 10 or 12 hours, although an advance of 10 per cent in rates per hour, to restore a cut made during the depression of 1893, was offered. The corporation posted a notice that it would leave it optional with the men to work longer if they desired, but that it would not compel them to do so. The employees considered that this was virtually a violation of the law. They demanded 30 cents an hour for furnace men instead of the 25 cents offered by the company. The representative of the American Smelting and Refining Company asserted that, even with the rates offered by the company, wages would be higher in its works than in those of independent competing smelters, while representatives of the employees asserted that the wages paid by the outside companies were usually higher than those offered. The representative of one of the competing smelters testified that it was paying about 10 per cent less per day under the 8-hour system than it had been paying under the 12-hour system.⁴

During this strike the American Smelting and Refining Company refused to negotiate with the organization of the smeltermen. The company's representative held that the organization was a new one, formed largely under the influence of agitators, and therefore not worthy of formal recognition. The combination closed its smelters in Denver and one or two others in Colorado on account of the strike, and diverted at least part of the work formerly done by those establishments to other plants operated by it. The representative of the company admitted that the fact that it controlled numerous plants strengthened its position as against strikers, and, indeed, in

¹ Smith, pp. 214, 215; Clarke, p. 328; Sullivan, p. 349.

² Wright, p. 313; Clark, pp. 328, 329; Grant, p. 197; Smith, p. 215; Sullivan, pp. 351, 356; Coates, pp. 248, 249, 257.

³ Coates, p. 250; Clark, pp. 329, 330; Smith, p. 216.

⁴ Newhouse, pp. 301, 302.

its dealings with labor generally, since part of the plants could be closed while the business was still carried on profitably in others.¹

Blacklists.—Several representatives of labor organizations asserted that blacklisting was commonly practiced by mine owners in Colorado and that the law against it has had virtually no effect.² In Utah there is a constitutional provision prohibiting blacklisting.

Wages of labor.—Notwithstanding the statements to the effect that the mining industry in the Western States is generally prosperous, several representatives of labor organizations stated that there were a considerable number of miners constantly out of employment, and that very few miners worked full time. One metal miner of Colorado stated that he had worked about 250 days during 1898, and that this was more than the average number of days worked by metal miners during recent years.³ One or two representatives of the mine operators, however, asserted that employment was fairly regular. They asserted especially that the improvements in mining machinery, while they have at first displaced labor, have afterwards made possible the extension of operations so as to increase the demand for labor.

It appears from the testimony that the usual wages in the precious-metal mines of Colorado are from \$2.50 to \$3.50 per day, the more common rate for skilled labor being \$3, while in some of the isolated mining camps the rates run as high as \$4 and \$4.50. In Utah the prevailing rate of wages in the precious-metal mines was said to be about \$2.50, although in a few cases the rate for skilled miners was as low as \$2, and in others as high as \$3. In Montana and Idaho, it was said, the wages were from \$3 to \$3.50. Witnesses stated that the cost of living is lower in Utah than in the adjoining States, and that the mines are dryer and more satisfactory to work in, especially because of the saving of the expense of rubber clothing.⁴ While wages in all these States have decreased somewhat during the past 20 years, it is the opinion of some witnesses that their purchasing power is higher than before on account of the reduced cost of living. One miner thinks that wages as measured by purchasing power are a little lower than 20 years ago.

At the time of the great fall of the value of silver after 1890 wages of metal miners in several of the mining States were very generally cut. In some instances there was an understanding that if the value of silver should be restored wages would be raised again, but the price of silver has never risen sufficiently to bring about an increase in wages.⁵

In the coal mines of Colorado and Utah, according to the statements of witnesses, wages are usually paid by the ton. In the northern Colorado field the rate in 1899 was 80 cents per ton, having been reduced from 92½ cents in 1888. In Utah the rate for screened coal was from 60 to 80 cents per ton, and for "run-of-mine coal" from 35 to 45 cents per ton. Mr. Clark, a representative of organized miners, stated that at one of the best coal mines in Colorado during 1897 the average earnings of the men for the days they worked were \$2.30 per day and their average working days 11½ per month. The representative of the Colorado Fuel and Iron Company, however, declared that hundreds of its miners earned over \$100 per month net, and that \$2.60 per day was paid to day laborers working outside the mines. The manager of the Pleasant Valley Coal Company of Utah stated that for February, 1899, the average wages of its miners, after deducting powder and other charges, were \$2.65, men working outside the mines being paid 20 cents per hour. There was a consensus of

¹ Grant, pp. 199-211; Coates, pp. 247, 253, 254; Wright, 306-320, 321; Beaman, pp. 275, 288. The smelter men's strike was settled soon after this testimony was taken, the strikers being unsuccessful in securing the terms demanded.

⁵ Chambers, pp. 581, 582; Allen, p. 570.

evidence to the effect that wages have fallen in coal mines during the past 10 or 15 years, but the fall does not appear to have been great.¹

It was stated by representatives of the smelter companies in Colorado that the wages vary considerable according to the skill of the workmen. After the establishment of the 8-hour day, in 1899, the rates for most employees in smelters at Pueblo were \$1.80 and \$2, about 10 per cent less than for 12 hours' work before. The smelters of the American Smelting and Refining Company at Denver at that time offered \$2 per day to furnacemen, who had been receiving \$3 per day for 12 hours in 1893 and \$2.75 thereafter. In Utah the wages, under an 8-hour day, in one of the leading smelters, ranged from \$1.40 for laborers to \$2 for furnacemen, and \$2.40 for crushermen.²

Intervals of wage payment.—It appears from the testimony that, at least in 1899, it was the custom in both metal and coal mines and in smelters in the mountain States to pay wages monthly. Several representatives of workingmen urged that the intervals of payment should be weekly and biweekly. More frequent payment, it was argued, would relieve the men from the necessity of buying goods on credit, especially freeing them from the domination of the company store. One or two mine operators, however, maintained that the extra labor of preparing more frequent pay rolls, as well as the tendency of miners to waste time in dissipation at pay days, rendered more frequent wage payments undesirable.³

Screening of coal.—In neither Utah nor Colorado is there any law regarding the use of screens in determining the quantity of coal on which wage payments shall be based. It appears from the testimony of representatives both of employers and employees that most miners are paid on the basis of screened coal, although in some cases, particularly where coal is sold by the companies just as it comes from the mines, the "run-of-mine" basis is used in paying the workingmen. It was asserted by Mr. Clark that there were very considerable differences in the size and form of screens used in different Colorado mines. It was stated by several witnesses that from one-third to one-half of the coal passed through the screens. Two or three representatives of the miners favored legislation requiring the payment of wages on the basis of all the coal mined. The manager of the Colorado Fuel and Iron Company, on the other hand, argued strongly against such a practice. He asserted that the different purposes for which coal was used, and the different kinds of coal, made it desirable to screen some and not to screen other coal; but that generally as much lump coal as possible was desired, and by paying the miners on the basis of lump coal, a premium was put on careful and skillful mining. This witness believed that the majority of the coal miners themselves would oppose the uniform application of the run-of-mine method of payment. A Utah coal operator stated that his miners were paid on the basis of the actual weight of all coal, with the deduction of an average percentage of screenings ascertained by a test made several years ago.⁴

There appeared to be very little complaint on the part of Western miners regarding the system of docking wages on account of the loading of coal containing rock and other waste material, although one witness thought there were some abuses in connection with this practice.⁵

*Company stores.*⁶—It was stated by various witnesses in 1899 that company stores were found in connection with most, if not all, of the Colorado coal mines, but that

⁵Smith, p. 218; Coates, p. 252; Thomas, p. 624.

⁶Coates, pp. 250, 251; Clark, pp. 332, 333, 336, 348, 352; Smith, pp. 217, 218; Grant, p. 193; Thomas, pp. 625, 629; Sharp, p. 641; Allen, pp. 570, 578; Terhune, p. 595; Hanauer, p. 608; Chambers, p. 585; Callis, p. 632.

they were rare in connection with precious-metal mines. In Utah company stores seemed to be rare in the coal mines as well as the metal mines, although some were said to exist. Special complaint was made by representatives of the workmen regarding the abuse of the company-store and store-order system by the Colorado Fuel and Iron Company, and to a less extent by other coal companies in Colorado. It was asserted that miners were virtually compelled to trade at stores owned or designated by the companies. Although an absolute rule to that effect might not be made, those who did not deal at the stores were discriminated against. It was also asserted that the charges of these stores were excessive, while one witness complained of the fact that the coal companies usually charged the miners \$2.50 per keg for powder, the cost of which was about \$1.25 or \$1.30.

A representative of the Colorado Fuel and Iron Company stated that it had a subsidiary organization operating stores at some mines, and at others it made arrangements with responsible merchants to receive the company's orders and to pay the company a commission of 5 per cent. In consequence of the company-store law the company no longer issues orders on these stores, but the miner draws his own order and is charged with the goods against pay day. The system, this witness asserted, is satisfactory to the miners, enabling them to get goods at lower prices than they could get them at from other merchants, especially because the company stores buy in very large quantities. The opposition to company stores, he added, arises chiefly from competing dealers. Laborers can not be expected to respect a law which prohibits the very natural arrangement by which employers furnish goods when desired. The witness further stated that no coercion was exercised upon the employees of the company to compel them to deal at the company store, and that the company made no effort to prevent other stores from being established.¹

Company tenements.—It was stated by several witnesses that it is a relatively common practice for operators of both metal and coal mines in Colorado and Utah to rent houses to their employees, although the system is by no means universal. Two miners especially complained that the company houses were mere cabins; that in many instances the miners were virtually compelled to live in them, and that the system gave employers an undue control over their men, especially if the latter desired to strike. The representative of the Colorado Fuel and Iron Company asserted that the houses furnished by that company were good frame houses of from 3 to 5 rooms and that the rents were reasonable.²

Company boarding houses.—A metal miner of Colorado testified that some mining companies in that State ran boarding houses, virtually compelling the men to board there, and that as much was charged for board alone as private houses would charge for board and lodging. It was stated by two or three witnesses that company boarding houses are also more or less common in Utah. One smelter operator in that State said that the practice was formerly more common, but that, on account of the opposition of the miners, boarding houses have usually been discontinued, or at least the compulsion to board at them has been abandoned. One Utah mine operator stated that his company owned a boarding house and expected its men to board there, the rate being 80 cents per day, while another said that the men were not required to board at the boarding house run by his company.³

Compulsory fees for hospital and medical services.—According to the testimony of both employers and employees, it is the custom of mine and smelter operators in the Rocky Mountain States to provide for hospital and medical service for their employees, deducting from their wages a fee, usually of \$1 per month, to cover the expense. In general, there is a company doctor who receives these fees and who must maintain the hospital. The two laboring men who gave testimony on this subject were not

¹ Beaman, pp. 262, 263, 276-278, 290.

² Coates, p. 252; Beaman, pp. 265, 278; Smith, p. 218; Clark, p. 233; Wright, p. 307.

³ Sullivan, pp. 350, 353; Thomas, p. 625; Terhune, pp. 631-633; Allen, pp. 569, 570; Sharp, pp. 641, 642; Hanauer, p. 608.

especially disposed to criticise the system, although it was asserted that smelter workers in Colorado were inclined to consider it an abuse. The hospital system is said, however, to have been one ground of complaint in the Cœur d'Alene strike. (See below.) In this connection it should be noted that the mine operators also frequently deduct a sum from the wages to cover accident insurance.¹ (See below, page xv.)

The 8-hour laws of Utah and Colorado.—The legislature of Colorado in 1899 enacted a law which went into effect June 15, 1899, fixing the hours of labor in mines and smelters at 8 per day. It was stated that the previous hours of labor had usually been 10 in mines and 10 or 12 in smelters.

During the summer of 1899 several witnesses said that the mine companies in general had complied with the law, although no statement was made as to whether changes in the rates of wages had accompanied the reduction of hours. Some of the smelters complied with the law, reducing wages somewhat, while, as has been above pointed out, the American Smelting and Refining Company nominally obeyed the law, but reduced wages materially and offered its men the option of working longer. The Colorado statute was afterwards declared unconstitutional.²

Several representatives of the Colorado miners declared that they considered the reduction of hours highly desirable, especially because of the improvement in the health and standard of living of the miners which might be expected. It was asserted that the 8-hour law had been enacted largely under the influence of labor organizations. Several prominent employers of labor, however, argued strongly against the enactment of the 8-hour law. They declared that the differing conditions in different mines made variations in the number of hours desirable. It was asserted that if in the coal mines the men worked only 8 hours, many more men would have to be employed in the winter season, and that in the summer, when the work is light, these additional men would have to share in the small aggregate earnings, reducing the annual wages of all. Two or three witnesses believed also that the reduction of hours, unless wages were likewise reduced, would cause many precious-metal mines to close. Mr. Grant and Mr. Hill, smelter operators, expressed the opinion that in smelters, because of the uniform capacity of the furnaces, a reduction of hours must mean a decrease of product in somewhat the same proportion. Another smelter operator, however, thought that the arrangement of labor in smelters in three 8-hour shifts furnished considerable advantages, the only other satisfactory method being 12-hour shifts, which are perhaps too long.³

In Utah the State constitution authorized the legislature to provide for the safety and health of employees in factories, mines, and smelters. An act of the legislature, passed in 1896, fixed the hours of labor in mines and smelters at 8 per day, and this was declared constitutional by the supreme court of the State and the Supreme Court of the United States in the case of *Holden v. Utah*.⁴ There was a general agreement among the witnesses representing both employers and employees that this act had proved beneficial. Several employers stated that the men worked harder and, whether they worked by the piece or by the day, accomplished practically as much in 8 hours as they had done in 10, especially in mines. The hours of labor are usually measured at the place of actual work. Witnesses also agreed in maintaining that the general health and morality of miners and smelter men had been improved by the reduction in hours and the added leisure thus given. In some instances day wages were reduced when the hours were lessened, but in others the same rates were paid as before.⁵

Sunday labor.—It appears that Sunday labor is almost universal in smelters in the Western mining States. Smelter operators stated that it was necessary to run the smelters continuously, but that as many men as possible were given a day of rest on Sunday, while in one smelter, at any rate, the work is so arranged that each man gets one day off at some time during the week if he desires. It was also stated that stamping mills must be operated on Sundays. One mine operator, however, declares that in his opinion men who work on Sundays during the year, in one way or another, lose as much time as they would by working 6 days in the week.¹

Safety and sanitation of mines.—There was a vigorous complaint on the part of one metal miner of Colorado regarding the conditions of health and safety in the mines. He asserted that the hoists and cages were often insufficiently protected and guarded; that the electrical apparatus for hoisting and motive power was frequently unsafe; and that the ventilation was generally very poor, because of the use of blasting powder. A Utah mine operator asserted that metal mines were usually well ventilated.²

A smelter workman complained of the unhealthful condition of some of the smelters, although he believed that in most plants there were fairly satisfactory systems for removing gas, smoke, and cinders. Smelter operators in Colorado asserted that working in smelters is not necessarily injurious, where there is proper precaution, and especially where lead is not used; but a smelter operator at Salt Lake City admitted that the fumes of arsenic, sulphur, and lead in his smelter tended to injure the health of workingmen.³

Mine-inspection laws.—In Colorado there is a bureau for the inspection of coal mines and a separate bureau for metal mines. The latter has 2 inspectors, besides the commissioner of mines. The commissioner declared in 1899 that the inspectors were not able to get around to all the mines, as the law requires them to do, but were forced to confine themselves mainly to investigation on complaint. Several other witnesses confirmed the statement as to the inadequacy of the inspection force. One miner declared that he had seen an inspector only once in 10 years, when the inspector went through the mine in about 20 minutes.⁴

In Utah there is no law for the inspection of metal mines, although there is one for the inspection of coal mines. It was stated that efforts to secure the inspection of metal mines had been defeated by the mine operators. There is only one coal-mine inspector. One coal miner declared that the ventilation of coal mines had been much improved, but was still unsatisfactory.⁵

In Idaho, apparently, the mine-inspection system is a rather perfunctory affair.⁶

Compulsory accident insurance.—It appears from the testimony of both employers and employees that it is the common custom among the precious-metal mines and smelters of Colorado and Idaho to insure their men against accident, deducting a certain amount, usually \$1 per month, from their wages to cover the cost. Several of the witnesses, however, stated that the custom of compulsory insurance was not general in Utah. One mine and smelter operator of that State said that in his mines it was optional to take accident insurance or to pay for hospital service, and that the men usually preferred accident insurance. No statements or opinions on this subject were made by employees, although the deputy commissioner of labor of Colorado urged that a rigid employers' liability law was especially desirable in that State.⁷

Standard of living and general character of labor.—There was an agreement on the part of representatives both of employers and employees, that the general standard

of living and character of the miners and other workmen of the mountain States had improved materially during the past 20 years; that they had more comforts and conveniences, a higher standard of living, and greater morality and intelligence. Representatives of the workmen attributed this improvement largely to the efforts of labor organizations, while employers considered it as due to the development of the public-school system and the general progress of civilization with the opening up of the country. The reduction in the cost of living was especially emphasized by numerous witnesses. Two or three witnesses in Utah spoke of the large proportion of miners and smelter workmen who are married and of the growing tendency toward the ownership of homes by workmen.¹ One witness, however, asserted that the standard of living of coal miners in Colorado was much lower in 1899 than it had been 10 years before.²

Foreign-born labor.—Little evidence was presented as to the nationality of laborers in the precious metal mines of Colorado. It was stated that in the coal mines a considerable number of foreign-born were employed, some having been imported from other States by the operators, but that most of these were able to speak English. In Utah, in both metal and coal mines, according to the evidence, probably a majority of the miners are foreign-born—Italians, Finns, Irish and Swedes being especially numerous. It appears that in the smelters also many foreign-born are employed, especially in the lower grades of work. Colored labor has not been employed to any considerable extent in the West, in either mines or smelters, although a number of negroes were said to have been imported by the Colorado Fuel and Iron Company.³

THE CŒUR D'ALENE STRIKE AND RIOT OF 1899.

The subcommission on mining visited, in July, 1899, the Cœur d'Alene mining district of Idaho, the scene of the riot of April 29, 1899, during which the mill of the Bunker Hill and Sullivan Mining Company at Wardner was destroyed and two men were killed. The testimony of a large number of witnesses was taken as to the strike and riot, the subsequent establishment of martial law, the arrest and detention of miners, and the requirement of permits from the authorities as a condition of work in the mines.

Causes of strike—Preceding events.—It appears that the Bunker Hill and Sullivan Mining Company has, ever since 1893, had difficulty with its employees, especially as to the rate of wages and as to the recognition of the miners' unions. From 1895 until a short time before the strike of 1899, the company had been paying \$3 per day to miners and \$2.50 to mine laborers, shovelers, etc. The prevailing union rate of wages in the other mines of the district was \$3.50 for both classes of employees. Beginning in 1895 also, the company refused to employ union men, although gradually, the situation having become less strained, some of its employees became members of the union without being discharged. In April, 1899, the unions of the district made an effort to draw a larger proportion of the employees of the Bunker Hill and Sullivan Company into their membership. The company then undertook to discharge its union men. Members of the union at Wardner, including chiefly the employees of the Last Chance mine, thereupon, April 23, 24, and 26, sought to interfere with the working of the Bunker Hill mine, visiting the mine in force and with arms, and trying to induce the miners to join the union, at the same time demanding from the company recognition of the union. This recognition was refused, but

¹ Coates, p. 252; Sullivan, p. 353; Wright, p. 312; Callis, p. 631; Thomas, p. 626; Hill, p. 380; Lee, p. 233; Terhune, p. 592; Chambers, p. 585; Allen, p. 576; Sharp, p. 640.

² Clarke, p. 332.

³ Smith, pp. 221, 222; Coates, pp. 248, 249; Thomas, p. 626; Hanauer, p. 611; Chambers, p. 588; Allen, p. 572; Hill, p. 377; Newhouse, p. 296; Terhune, p. 595; Wright, p. 813.

the company increased wages to \$3.50 for miners and \$3 for mine laborers, and work in the mine continued for a few days, until April 29.¹

The assistant superintendent of the Bunker Hill Company declares that there was, on various grounds, justification for lower wages at the Bunker Hill mine than at the mines on Canyon Creek, where the union rates were paid, and this position is also taken by the coroner's jury and by a representative of one of the Canyon Creek mines.²

Several of the witnesses representing the miners, however, blame the Bunker Hill Company for refusing to pay union wages or to recognize the unions, for compelling the men to contribute to a hospital fund, and on other grounds.³

Description of riot.—The evidence shows that early on April 29 a body of miners boarded the Northern Pacific train at Burke, the station farthest up Canyon Creek, and took possession of the train. At Gem, the next station, other miners boarded the train, and near that place a powder house was broken open and a large quantity of giant powder was seized. Near Wallace, the county seat, another body of miners, from Mullan, got on board. The mob compelled the engineer to run the train over the tracks of the Oregon Railroad and Navigation Company to Kellogg, the junction near Wardner. There the mob was joined by miners from Wardner. The number of men in the mob as thus brought together is variously estimated at from 800 to 1,200. The evidence seems clear that most of the miners working on Canyon Creek were in the body. Perhaps 200 of the men were armed, and these for the most part were masked. The mob proceeded to the mill of the Bunker Hill and Sullivan Company and destroyed it and other property. There appears to have been no effective resistance to the mob. A few of the employees of the Bunker Hill Company were seized. These were told to run and several shots were fired at them. One of them, James Cheyne, was killed. Another man, John Schmidt, supposed to have been a member of the mob itself, was also killed by the mob, either accidentally or intentionally. The rioters then returned to their respective homes.⁴

Alleged complicity of unions (see also page xxi).—An important question is as to the extent to which the miners' unions were implicated in this outrage, either directly and officially, or indirectly. The findings of the coroner's jury upon the bodies of the two men killed assert that the riot may be attributed directly to the action of the unions; that meetings of the unions at the various towns were held immediately before the action, and that it was resolved to proceed to Wardner in a body; that arms were taken and masks put on in at least one of the union halls, and arms were taken by members of another union while marching in a body from the hall to the train. Two or three of the witnesses maintain that these same facts were proved, by the evidence of the members of the unions themselves, in the trial of Paul Corcoran for murder, and in the other trials held by the State and Federal courts. Aside from such formal action by the unions, it is urged that practically all of the miners on Canyon Creek took part in the riot, and that practically all of them were union men, so that the action can not be considered otherwise than as union action.⁵

The commission did not take detailed evidence as to the precise action of the unions. Two or three members of the Burke and Gem unions denied before the commission that any meeting was held before the riot or any action taken. These and other witnesses strenuously insist that the purpose of by far the larger part of

the members of the mob was merely to make a demonstration or to see what was going on, and that only a comparatively few, particularly those who bore arms, had any definite plans. These witnesses declare further that the unions, and the great majority of their members, have always been law-abiding in spirit, and that most of the miners deeply deplore the destruction of the property and the killing of the men.¹

Declaration of martial law.—Shortly after news of the events of April 29 reached the governor of Idaho, he sent Mr. Sinclair, State auditor, to Shoshone County with power to take whatever measures he might deem necessary to apprehend the criminals and to prevent further lawlessness. Mr. Sinclair remained in charge as the representative of the governor up to the time of the evidence before the commission. He declares that he himself is primarily responsible for the various measures taken, but that they have been approved by the governor.

By the suggestion of Mr. Sinclair, the governor declared the Cœur d'Alene district under martial law, and at his request the Secretary of War sent to his assistance the United States troops located at Spokane, Wash., which were under the command of Gen. H. C. Merriam. Mr. Sinclair says that all of the militia of the State of Idaho was at the time in the Philippine Islands, so that recourse to the Federal troops was necessary. The same witness and other mine operators, as well as the ex-mayor of Wallace, justify the declaration of martial law, on the ground that the civil authorities of the county were not only unable but indisposed to take the measures necessary to apprehend the large number of persons implicated in the crime of April 29. It was, they declare, necessary at once to arrest a very large proportion of the male population with a view to preventing the escape of the guilty ones and to securing evidence. Furthermore, the experience of earlier years, together with that in April, warranted the fear that further disorder might arise unless ample precautions were taken.²

Several witnesses, however, especially miners, assert that after the riot there was no further danger of lawlessness; that the miners had returned to work; that it would have been possible in due time for the sheriff and county commissioners to obtain necessary deputies and to arrest the comparatively small number of persons who were actually responsible for the crime. The chief complaint of the miners, however, is as to the procedure of the troops, and as to the acts done by the State authorities with their assistance, rather than as to the declaration of martial law.³

Removal of county officers.—In this connection it should be noticed that by the judgment of the State district court the sheriff and county commissioners of Shoshone County in office at the time of the riot were impeached and removed shortly after the riot, and that other officers were appointed in their place by the governor. Some minor technical charges were brought against the displaced officers, but the chief charge was that they had failed to take proper steps to prevent the riot, and afterwards had failed even to attempt to apprehend the criminals. The report of the coroner's jury on the bodies of the men killed goes even further, and charges the county commissioners and the sheriff with complicity in the crimes. The decision of the court, the findings of the coroner's jury, as well as several witnesses before the commission, declare that the county commissioners and the sheriff were notified of the action of the mob of union men at the Bunker Hill mine on April 23, 24, and 26 in attempting to prevent the nonunion men from working, and that they were informed of the danger of further trouble, but that no attempt was made to gather a posse and suppress disorder. The sheriff, it was declared, was on the train bringing the rioters from Wallace to Wardner on April 29, and was present during the proceedings at the Bunker Hill mill, but did nothing more than to order the mob to disperse.⁴

³ Sovereign, pp. 393-395, 398-401; Gann, p. 488; Gill, p. 524.

⁴ Decision of the district court, pp. 501-508; findings of the coroner's jury, pp. 469, 470; Sinclair, pp. 552, 562, 563; Burbidge, pp. 451, 452; Finch, p. 499.

Mr. Young, the deposed sheriff, on the other hand, declares that he did all in his power to prevent the riot. There had been no further violence after April 26, and the miners at Wardner had declared that they would not again interfere with the working of the Bunker Hill mine. The witness had had no intimation of the intended action of April 29. He had joined the mob in the hope that he might be able to influence them, although single handed; but he was unable to do anything to prevent their criminal acts. After the riot he deemed it necessary to wait for a short time before making arrests, until the feeling had quieted and until he could secure a large body of men. He believes that he could in due time have secured the apprehension of the criminals more effectively than was actually done under martial law.¹ Two or three other witnesses also declare that in their opinion the sheriff and county commissioners had done all that they could. Mr. Young and these witnesses also state their belief that the removal of the county officers was largely due to partisan reasons, and that, indeed, the wholesale arrests under martial law and the establishment of the permit system were due in part to the same motive. It is claimed that a majority of the voters in Shoshone County have been Populists, and that it was the desire of the Democratic governor and his associates to drive a part of the Populist voters out of the country and otherwise break up the party in that county.² Mr. Sinclair and Dr. France, the coroner, emphatically deny any such political motive in any of the actions of the authorities.³

Arrests.—Many complaints were made as to the wholesale manner in which miners were arrested after the declaration of martial law, and of the long detention of many of the persons arrested without formal charges and without trial. It is declared that the soldiers, under the direction of the civil authorities, took a "drag net" down Canyon Creek and arrested practically all the male members of the community, from 500 to 800 altogether. Some witnesses are inclined to believe that the soldiers in certain cases made arrests without the authority of the civil officers, but there seems to be no very definite basis for this charge. It is, however, clear that warrants were not usually served on the persons arrested. Many men who appeared before the commission had been arrested, although they declare that they had not even gone to Wardner on April 29, and they assert that many other innocent men were also arrested. Complaint is made especially that those arrested were generally not told what were the charges against them, that many of them were held several weeks under very disagreeable circumstances, and were finally discharged without trial by a court, sometimes even without direct examination by the State officers, being simply told that there was nothing proved against them. Some of these witnesses think that many arrests were made simply in order to terrify the men.⁴ Two or three specific instances were mentioned in which arrests were made on other charges than that of participation in the riot of April 29, these charges being, it is alleged, more or less frivolous and unwarranted.⁵

To these complaints it is replied, especially by Mr. Sinclair, that wholesale arrests were rendered necessary by the extraordinary conditions. Very nearly all the male members of the community had been present at the riot of April 29, even if they did not actively take part in it. Pending the discovery of the actual perpetrators of the crime, it was necessary to hold some innocent men in order to prevent the escape of the guilty, and to hold some as witnesses. As a matter of fact, Mr. Sinclair thinks that a very large proportion of the miners were guilty at least of conspiracy, and that a number of those discharged for lack of definite evidence were morally guilty. The

⁵ Stevenson, p. 509; Barnard, pp. 415, 418.

persons arrested were so numerous that it was impossible to sift their cases in a short space of time, but just as rapidly as any were shown innocent, by the investigations of the witness himself or of the grand jury, they were set free. At the time of the investigation of the commission, about 3 months after the riot, the 230 to 260 men who remained imprisoned included practically only those who were under indictment on one charge or another. It is necessary, Mr. Sinclair concludes, in every community from time to time to arrest and hold innocent men until they can be proved innocent. Dr. France, the coroner, makes similar statements.¹

Treatment of prisoners.—Many witnesses complain that the prisoners were ill-treated by the soldiers during their detention. Several state that they themselves were deprived of food and water for 24 hours when first arrested. It is also stated that the prisoners suffered greatly with cold, especially during their detention in the barn which served as a prison for some time, until the construction of the special buildings constituting the so-called "bull pen." Here, it is claimed, the men were without bedding, and in many cases they had to lie on wet hay or manure. Complaints are also made that the weak and sick, as well as the strong, were compelled to work, that those seriously sick were without proper medical attendance, and that the dying, in one or two instances at least, were deprived of religious consolation. It is further alleged that the soldiers, especially the colored soldiers who were at first stationed in the Cœur d'Alene district, were harsh in their treatment of the prisoners, often prodding them with bayonets, striking them, threatening them, and using abusive language toward them. No very serious ill-treatment was definitely stated by witnesses as having been inflicted upon themselves, but there were many complaints of a general nature, and a number of specific statements as to minor instances of harsh treatment inflicted on the witnesses themselves or on others in their presence.²

Mr. Sinclair and Dr. France, the chief authorities in charge, however, deny emphatically that the prisoners were treated with undue harshness. They specifically deny knowledge of any failure to provide sufficient food, of ill-treatment or neglect of the sick, of the use of the bayonet or the inflicting of blows by the soldiers. They state that, on account of the immense number of prisoners and the lack of preparation for their care, they were at first necessarily somewhat uncomfortably housed and somewhat ill provided with bedding and blankets, but that the State sought as rapidly as possible to furnish a proper prison and to improve the condition of the inmates. Mr. Sinclair suggests that most of the miners were unaccustomed to detention and would consider any form of discipline severe.³

Permit system.—The strongest differences of opinion exist as to the justification of the permit system established by the State authorities after the strike of April 29. By proclamation of Mr. Sinclair, in the name of the governor, it was declared that certain organizations in Shoshone County had shown themselves criminal in purpose, and that accordingly mine owners must not employ men belonging to those organizations. Persons wishing employment were required to obtain a permit from Dr. France, who had been appointed sheriff after the riot. In applying for these permits they were obliged to deny participation in the riot of April 29, to declare the belief that the riot was incited and perpetrated by the influence of the miners' unions, to express disapproval of the riot, and to renounce membership in the miners' unions, pledging themselves thereafter to obey the law. It appears that comparatively few of the miners had at the time of the commission's investigation made application for these permits, either on account of opposition to the terms required or of fear of refusal.⁴

³ Sinclair, pp. 549-551, 555; France, pp. 473, 474.

⁴ Sovereign, pp. 390, 391; Sinclair, pp. 545-547; France pp. 471, 477.

Several witnesses representing the miners denounce the requirement of the permit and the conditions contained in the application. They declare that, in their opinion and in the opinion of most of the miners, the system is an invasion of the rights of individual liberty and of free contract, and therefore unconstitutional. Attention is especially called to the fact that a statute of Idaho prohibits discrimination against the members of labor organizations in the granting of employment. It is also urged that the miners' unions have not shown themselves criminal organizations and that no such extreme measures against them are justified. It is stated that the effect of the requirement was, wholly or partly, to suspend the operation of the mines for a considerable period, although gradually nonunion men were brought in to take the place of those who refused to apply for permits or who were unable to obtain them.¹

To these statements it is replied by Mr. Sinclair that the permit system was rendered necessary by the lawless character of the unions and of the mining population of the Cœur d'Alene district generally. The State authorities have no opposition whatever to unions as such, but are, in fact, disposed to encourage them; but it is necessary to break up the organizations which have shown themselves criminal in the past and to teach the community that such lawless organizations will not hereafter be tolerated. The State can not afford to run the risk of such disturbances as those which have occurred repeatedly in the past. While the requirement of a permit would not be permissible under civil law, it is legitimate under martial law in view of the extraordinary conditions prevailing. Dr. France and two mine officers also defend the system on similar grounds.²

Character of miners' unions.—This justification of the permit system depends, in part, upon the evidence as to the lawless character of the miners' unions of the Cœur d'Alenes. The evidence as to the participation of the unions in the riot of April 29, 1899, has already been referred to. Several witnesses, State officers and mine operators, declare that the miners' organizations have, ever since 1892, either directly or indirectly, been guilty of criminal acts. While the majority of the members may perhaps be disposed to be law-abiding, they have been under the control of criminal and powerful leaders. Most of the lawless acts of previous years, it is stated, may not have been formally determined upon by the unions, but they were committed by union men, usually against or on account of nonunion men. The unions have dictated to employers, forcing them to discharge nonunion men. In two or three instances foremen, or other officers of the mines, have been driven from the country, and one foreman was shot in 1897. Nonunion men have in some cases been forced by threats to join the union; while in other cases they have been refused admission to the union. Those who refused to apply for membership, or who were denied admission, have often been driven from the country by violence or threats. In 1892 union miners, in an armed mob, attacked several mines and drove hundreds of nonunion men out of the country, some being killed on both sides. Other nonunion men have been killed from time to time. Attacks have also been made on the property of the mine owners. A considerable amount of specific evidence as to such lawless acts was presented by these witnesses. It is further stated by them that the sympathy of the great body of the miners has been to such an extent on the side of those guilty of such crimes that it has been in most cases impossible to discover and apprehend the perpetrators.³

Numerous miners, and one or two other witnesses, make broad statements to the effect that the miners' unions are not criminal organizations; that by far the most of the members are law-abiding citizens and have taken no part in the violent actions of previous years, but have, on the contrary, deprecated them. Some of these witnesses specifically deny that the unions as such have participated in any of the past

XXII INDUSTRIAL COMMISSION:—THE MINING INDUSTRIES.

lawless acts, but admit that members of the unions have been guilty of such acts. Mr. Sovereign, editor of the Idaho State Tribune, at Wallace, declares that there is far too large a conservative element among the members of the unions to permit criminal action to be taken by the organizations as such.¹

CAPITAL IN EASTERN COAL MINING.

Several witnesses complain of the decline of profits in coal mining; doubtless indicating a condition, however, which is not peculiar to one industry. The profits of coal mining in Illinois 30 years ago are said to have been very large; but in the last 10 years, partly because of strikes, and partly because of excessive competition, they are asserted to have been very small. Somewhat similar accounts come from the Pittsburg region.

The practice of assessing the value of coal in undeveloped territory, for purposes of taxation, is referred to as an injustice by an Illinois witness, because until a mine is developed it is impossible to tell whether there is coal in the ground, or what its value is. The methods of the local assessors in the anthracite region are stated to vary greatly. The average profits of anthracite operators are estimated by one of them at from 5 to 7 per cent.²

Some interest begins to be felt in the duration of our coal supply. One independent anthracite operator believes that another 50 years, at the present rate of consumption, will nearly finish the anthracite coal. The bituminous coal of the Pittsburg region is expected by one of the operators to be exhausted in 75 years.³ Other witnesses before the commission have estimated the duration of the anthracite beds at from 80 to 200 years.⁴ The highest estimate is that of Mr. McLeod, who was for some years president of the Reading railroad.

The testimony does not indicate that any considerable proportion of the bituminous coal in the eastern United States is owned by the railroads. One or two railroads are said to be largely interested in mines in northern Illinois.⁵ There is said to be some railroad ownership in Ohio, and the interest of railroad officers in Ohio mines is also referred to.⁶ The large and increasing control of the anthracite by railroad interests was clearly brought out. The general superintendent of the Philadelphia and Reading Coal and Iron Company stated that his company alone mined 80 to 85 per cent of the anthracite that goes over the Reading road, and about 18 per cent of the whole output of anthracite. An independent operator stated in May, 1899, that 11 roads owned two-thirds of all the mines.⁷ The president of the United Mine Workers stated in 1901 that 90 per cent of the coal was then owned by 7 railroads, and that this is fully 15 per cent more than they owned before the strike of 1900.

The effects of railroad ownership of anthracite upon the independent operators and the consuming public are emphasized by several witnesses. It is admitted that freight rates on anthracite are uniform to all shippers, but it is pointed out that when the railroad itself mines the coal the division of the price at destination into freight and price at the mine is only a matter of bookkeeping. The railroads are asserted to allot an excessive amount to freight, and so to depress disproportionately the share which is allotted to the coal at the mouth of the pit. It is repeatedly stated that the freight charge on anthracite is four times that charged on bituminous coal for equal distances. Two or three witnesses estimate the average rate on anthra-

cite at 10 mills a ton a mile, and particular instances of much higher rates are cited; while bituminous coal is said to be hauled at $2\frac{1}{2}$ mills a ton a mile. By these excessive freight charges independent operators are alleged to be compelled to sell their coal to the railroad companies. Contracts under which the operator receives 60 per cent of the price at tidewater on the most valuable sizes and smaller proportions on the less saleable coal are said to be common. It is also asserted that the railroads have bought up large quantities of coal lands at low prices, after depressing the value through their excessive freights. The fixing of the selling price and the limitation of the output by agreement of the railroads is referred to by one or two witnesses. One independent operator, however, declares that nothing has transpired in connection with his business that would lead him to believe that prices are fixed by a combination, and that he has never felt any pressure from the railroad companies. It is interesting to note that the same witness testifies that the railroads own but little mining land in his vicinity, and that 40 or 50 per cent of the coal in that neighborhood is produced by independent operators.¹

Several witnesses refer to the allotment of the anthracite production among the several railroads. The stronger roads are said to be able to secure for themselves more than their share, so that mines which are tributary to them are able to work more days in the year than those upon the other roads. It is also asserted that the mines owned by the railroads themselves are permitted to run more than the independent mines. No mine can run except as cars are furnished it for shipping, and more cars are alleged to be given to the railroad mines. On the other hand, the general superintendent of the Philadelphia and Reading Coal and Iron Company asserts that he never heard any such complaints in the region where his company operates. In that region every colliery is rated, by officers of the Coal and Iron Company appointed for that purpose, upon its producing capacity. The railroad distributes the cars upon the basis of the rating, and always leans toward the individual operators to avoid any accusation of partiality. When the demand is slack, this witness asserts, the independent operators run more steadily than the Coal and Iron Company, so that their proportion of the shipments over the Reading road runs up from 15 per cent to 20 per cent, and has been known to go as high as 25 per cent. They are furnished with cars enough to make this possible.²

While substantial unity of control, by agreement among a limited number of powerful interests, appears to have been effected in the anthracite region, there seems to be no considerable approach as yet toward such unification among the bituminous mines. The desire for agreements which should diminish competition and increase prices is indicated by several witnesses, including one member of the executive board of the United Mine Workers. His idea is a general organization of operators and miners to regulate prices and wages. The president of the Illinois Coal Operators' Association believes all combinations to be injurious to both workers and consumers, and against the public interest. Two unsuccessful attempts at combination in Ohio are mentioned, and are said to have been generally disapproved by the operators. In the Danville, Ill., district one company sells all the coal. An association exists in West Virginia which divides orders and cars in proportion to the producing capacity of the mines, and sells in the Western markets through a single agent. Other attempts at combination on a smaller scale are referred to.³

There is no evidence of freight discrimination between individuals, unless the assertion of one witness that coal from West Virginia has been sold at lake ports at less than the published rate of freight may be so regarded. The existence of such discriminations is repeatedly denied. There is, however, some testimony to the effect that railroads which have coal-mining interests in the bituminous fields adopt the

² Brooks, 155; Luther, 649-652.

Robinson, 7-9; McKay, 61-63; Schluederberg, 77; Dalzell, 114, 119, 122; Mullins, 171, 172.

same policy as the anthracite roads, of charging high freight rates, and so diminishing the value of coal at the mine, while raising the price to the consumer.

Complaints are made of rates which are regarded as unduly favoring particular regions. The rates on West Virginia coal are a special source of complaint. It is asserted that rates from West Virginia to Lake Erie are lower than from Ohio mines, not more than half as distant, and that coal is carried from West Virginia to St. Paul, perhaps a thousand miles, as cheaply as from Illinois, say 400 miles. These conditions are thought by one witness to be due in part to ownership of mines by railroads or by their officers. It is also suggested, however, that it may be due more to the anxiety of certain roads to get business, especially roads that are financially weak.¹

LABOR ORGANIZATIONS OF COAL MINERS.²

It appears that the first organization of coal miners was formed as early as 1868, in the anthracite region. Several attempts were made to establish a national organization, and they had greater or less temporary success. The United Mine Workers was formed in 1890. It attained only a small strength until the great strike of 1897. The interest which was aroused by that struggle gave it an impulse which has been followed by a remarkable growth. It had no considerable strength in the anthracite region until the anthracite strike of 1900. It went into that strike, it is said, with a membership of only 8,000 among the anthracite miners, and came out of it with about 100,000. According to the statement of the president, the total membership in January, 1897, was 11,000; in January, 1898, 25,000; in January, 1899, 54,000; in January, 1900, 91,000; in January, 1901, 189,000; in July, 1901, about 250,000.

The success of the organization in increasing wages is referred to by several witnesses, both members and others. One outside witness states that in Illinois, because of the increased wages of miners, coal cost about 22½ cents a ton more in 1900 than in 1899. Another witness, not a member of the union, estimates that the average increase of wages in Illinois between 1897 and 1899 was 30 per cent. The president of the organization declares that in all the central States, where the union has acquired great strength, wages increased 40 per cent between 1897 and 1901. No doubt the increase is partly due to the general rise of prices and wages, which is one of the phenomena of increased industrial activity, as well as partly to the efforts of the union.

All the employers who refer to the matter speak well of the organizing of the miners as a general principle, and of the United Mine Workers in particular. The organization is said to be managed by able and conservative men, and the effects are said to be good for employers as well as for employees.

It is stated that while the organization uses all legitimate means to bring in non-union men, it is only very rarely that the members refuse to work with them, or that it is demanded that membership be made a prerequisite to employment. It is pointed out that when a strike is ordered by the union, the nonunion men very commonly respect the order, and that both in the great bituminous strike of 1897 and in the great anthracite strike of 1900 only a very small minority of the strikers were members of the union when they quit work.³

It appears that colored miners are freely admitted to the organization, and apparently into the same local unions as the white miners; since the fact that they are permitted to hold office in the unions is specially referred to.⁴

WAGES IN COAL MINES, AND METHODS OF PAYMENT.

It seems to be generally agreed that since 1897, or thereabouts, wages have risen. (See above.) The rise is attributed, not only by the members of the miners' organization, but by some operators, to the strength of the organization and to the great

¹ Mitchell, 54; Schluederberg, 86, 87; Dalzell, 113, 114; Mullins, 169-174, 177.

² Robinson, 14; Schluederberg, 74-77; Mullins, 166, 172; Mitchell, 30-38, 699.

⁴ Mitchell, 32, 52, 53.

strike of 1897. The general upward tide, which has been flowing during these years, has of course contributed to it.

Widely varying statements are made as to the course of wages, when a considerable series of years is considered.

The secretary of the Illinois bureau of labor statistics, testifying in 1899, thought that general wages had risen materially during the last 30 or 40 years. He spoke especially of purchasing power. The president of the Illinois Coal Operators' Association, however, said about the same time that miners' wages were not as high in Illinois as they had been 10 years earlier. He gave definite statements of rates in his own mines. The representatives of the miners generally agreed at that time that wages had fallen during the past 15 or 20 years. This seems to be confirmed by the testimony of operators from Ohio and from the Pittsburg district.¹

The daily earnings in West Virginia are stated by an operator to be from \$1.25 to \$2, and by a miner at \$1.25 as an average, and \$1.75 as a maximum. For the anthracite region a representative of the miners gives the day wage (1898) as \$1.98 for 10 hours' work of a miner underground, and \$1.10 to \$1.64 for underground laborers. The workers on the breakers, etc., are said to receive from \$1 to \$1.20. This witness states that he himself in 1898 earned \$404 in 240 days' actual work at one of the best-paying mines. The representative of one railroad anthracite company says that miners working by the day receive \$2, and that the average miner ought to earn \$2.50 to \$2.75, working full time by contract. The representative of another anthracite company says that taking the names of from 6 to 12 men at each of his company's mines, good miners, poor miners, and average miners, he has found that they have actually drawn from \$500 to \$1,000 a year, after the deduction of all supplies. Since, however, each miner usually has an assistant, whom he pays, it is not clear whether the amounts stated were the wages of single men, or, in some cases, of 2 men. An independent anthracite operator, employing 120 to 125 miners, states that 23 per cent of his men earn less than \$300 in a year; 47 per cent earn between \$300 and \$500; about 30 per cent earn from \$500 to \$900; and some few, \$1,000. This employer declares that if a man's wages are very low, it is because he does not work when there is work for him. All this testimony was given in 1899 or in the spring of 1900, before the great anthracite strike, which resulted, according to Mr. Mitchell's supplementary statement, in a 10 per cent advance on existing rates.

The president of the United Mine Workers, taking the reported production of bituminous coal in 1898, and assuming the average price of mining to be 50 cents a ton—which he says is a high average estimate—states that the resulting amount of wages would give for each of the 248,000 miners less than \$1.03 for each of the 306 working days.²

All the testimony agrees that coal miners are employed only a fraction of the annual working days. Representatives of the United Mine Workers state that on the average the miners worked from 174 to 179 days out of 306 possible working days in 1897. One gives the average number of days of employment at 204 a year from 1890 to 1893, and at only about 100 from 1894 to 1897. An operator from West Virginia states the average number of working days at from 197 to 229; another from Ohio says hardly more than 200 to 225. The secretary of the Illinois bureau of labor statistics gives the average for his State at from 175 to 180 days.

A representative of the United Mine Workers gives the average number of working days in anthracite mines as 150. An independent anthracite operator states that some mines work as many as 250 days, but others only 100. The general superintendent of the Philadelphia and Reading Coal and Iron Company gives the number of so-called "breaker days" worked by his company since 1894. These are 10-hour days, and the number is obtained by dividing the whole number of hours worked

¹ Stephenson, 21, 24, 26; McKay, 69; Schluederberg, 75, 80, 81; Pearce, 99; Dalzell, 105, 107, 121, 122; Mullins, 167-169; Ross, 185, 186.

² Robinson, 7-10; Stephenson, 21, 24, 26; Mitchell, 57; James, 143, 144; Luther, 646, 647; Loomis, 661, 63; Marcy, 667-669.

XXVI INDUSTRIAL COMMISSION:—THE MINING INDUSTRIES.

in the year by 10. The number was, in 1894, 180; in 1895, 189; in 1896, 176; in 1897, 132; in 1898, 141; in 1899, 158. The last two of these years are years ending June 30, in consequence of a change of the fiscal year of the company.¹

Nearly all the actual mining in the anthracite region seems to be done on a contract or piecework system. Contract prices appear to be usually determined by individual bargaining between the miner and the superintendent. They vary from mine to mine, and from vein to vein. One operator, however, states that he pays a uniform price for a car of a given size.²

The sliding scale seems not to have been introduced in any coal mines outside the anthracite region. There it was established in 1875, or, in some parts, as early as 1868. The miners complained that they were not permitted to check in any way the computations or the statements on which their wages depended, and that the sliding scale had become meaningless, and tended to bring wages to a minimum. The superintendent of the Philadelphia and Reading Coal and Iron Company, on the other hand, gave figures showing the advance of wages with the price of coal in 1899 and 1900. The sliding scale was abolished as one of the results of the strike of 1900.³

The universal desire of the representatives of the miners is for a weekly pay day. In several States they have obtained laws requiring payment at particular intervals. A weekly-payment law was declared unconstitutional in Illinois as interfering with liberty of contract. West Virginia requires payment semimonthly, but the law is not enforced. The law of Pennsylvania is largely ineffective, because it requires semimonthly payment only "on demand." It is asserted that those who have demanded their wages semimonthly have found that they were given no more work. It appears, however, that many operators, at least in the anthracite region, do comply with the law, though disapproving it. In Ohio the semimonthly-payment law seems to be complied with.

The miners allege that the great reason of the operators for opposing frequent payments is their desire to compel miners to trade at the company stores. The operators complain of the great labor involved in the making out of frequent pay rolls, and they complain that pay day is likely to be followed by 2 or 3 days of idleness and dissipation. The representatives of the miners deny that more frequent pay days would mean less industry. The actual interval of payment, both in the anthracite and in the bituminous region, seems to be generally a month or half a month. The custom is repeatedly referred to of keeping back half a month's pay; that is, of paying only what has been earned up to a time half a month before pay day. The secretary of the Illinois Bureau of Labor Statistics testifies that in his State the miners have generally been able to obtain weekly payment by the strength of their organization. This witness thinks that frequent payment is better for the employees; that it does not increase drunkenness or loss of time, and that it works no special hardship to employers.⁴

The miners complain bitterly, both in the bituminous and in the anthracite region, of the practice of docking for impurities. They allege that whole cars are deducted from their account because of trifling amounts of slate or dirt. Statements are exhibited which show as many as 7½ cars docked out of 57 mined, and as many as 144 out of 1,750. Some of the operators maintain that the docking is necessary to prevent carelessness and dishonesty. One asserts that he has had car after car come out with from 1,200 to 2,200 pounds of rock topped off with coal. This witness, however, does not himself practice docking. He notifies the miner once or twice

¹ Robinson, 5, 10, 11; Mitchell, 36; Davis, 120, 127; James, 144, 149; Brooks, 153, 155; Luther, 646, 651

² Luther, 645, 647, 648; Veith, 654, 658; Loomis, 659; Marcy, 668, 669.

³ James, 146, 147; Luther, 646, 648, 649, 652.

⁴ Mitchell, 41; Dalzell, 109; James, 143; Brooks, 158; Ross, 183-185.

that his coal must be cleaner, and if the miner does not do better he is discharged. Other witnesses state that they follow the same practice.¹

There is no evidence of any refusal of operators to permit the miners to station check weighmen at their scales. One or two operators complain of the arbitrary conduct of check weighmen and the unnecessary trouble that they make. A representative of the United Mine Workers says that although operators allow the check weighman to test the scales, they often let it be done only at particular times, while scales can often be doctored with a touch.²

The practice of screening coal, before it is weighed to determine the amount earned by the miner, is a cause of complaint throughout the bituminous region. The miners feel that they are robbed of their wages on all that goes through the screen. The operators point out that more is paid per ton for screened than for unscreened coal, and that miners can earn as much on one system as on the other. They allege that the system of screening is a safeguard to the operator and a benefit to the more careful miners. It is desirable that as much coal as possible be got out in lumps. The screening system offers a premium for good work, and insures the careful miner the benefit of his care. This opinion is not, however, universally held by the operators. The commissioner of the Coal Operators' Association of Illinois believes that the run-of-mine system, if miners will use care, will make better miners in the end and be more satisfactory to both parties. He admits, however, that in his State, where the miners' organization has secured an agreement for the run-of-mine system, there is still some complaint about carelessness in loading poor coal.

Laws requiring coal to be weighed before screening have been held unconstitutional in Illinois and Pennsylvania. In West Virginia the law is not enforced, the supreme court of the State being equally divided as to its constitutionality. The constitutionality of a similar law was being tested in Ohio at the time of the hearings.

The representatives of the miners complain not only of what they think the unfairness of the screening system in general, but of variations in screens, due in some cases to their construction and in some cases to their need of repairs. The usual screen is 12 feet by 6, with flat bars, $1\frac{1}{4}$ inches apart. It is complained that some operators have used screens with as much as 80 square feet of surface instead of 72, and with diamond-shaped bars $1\frac{3}{4}$ inches apart. Indeed, a West Virginia operator states that the screens used in that State vary from $1\frac{1}{4}$ to 2 inches in opening.³

COMPANY STORES AND COMPANY TENEMENTS AT COAL MINES.

It is claimed on the part of the operators that the establishment of company stores is necessary because mines are opened in isolated places, where supplies could not otherwise be obtained. It is admitted by the miners that this is sometimes true. It is maintained, however, that such cases are exceptional, and that in almost all cases the necessity is temporary. The real reason for the maintenance of the company-store system is declared to be the great profit that it brings. Prices are alleged to be 15 per cent, 25 per cent, even 30 and 35 per cent higher than in other stores. The isolated character of many of the mining villages is mentioned as a justification for somewhat high prices. It is alleged, however, that miners are compelled to deal with the company stores, both by refusal of employment otherwise and by the barring out of other sellers. Often, it is stated, the mining company, owning the land where the town stands, refuses to admit any store but its own. Even when an outsider is permitted to establish a store, the company sometimes demands a percentage on his sales. In one instance peddlers and delivery wagons are alleged to have been prohibited from going near the company houses.

¹ James, 144, 146; Marcy, 669.

² McKay, 72, 73.

³ Robinson, 13; McKay, 64, 68, 70, 71; Pearce, 92, 94; Justi, 600.

Two influences are mentioned as contributing most powerfully to the decay of the company store system—growth of population and the consequent increase of trading facilities, and the growth of labor organizations. In most parts of the country the system appears greatly to have declined. All testimony agrees that it still flourishes undiminished in West Virginia, where the organization of the miners has little foothold. A West Virginia operator, who says that he knows of no operators who do not have company stores, asserts at the same time that prices are not excessive and that miners are free to deal elsewhere if they please. He admits, however, that the miners' organizations protest against the prices.¹

The supplying of powder by the anthracite operators was a special case of compulsory dealing. Powder which cost \$1.50 or less a keg was sold to the miners at \$2.50 or \$2.75. It was maintained on the part of the companies, however, that this difference was not to be regarded as profit, but was taken into account in the fixing of wages. The Philadelphia and Reading Coal and Iron Company sold powder at \$1.50 a keg. All the operators reduced it to this price as a result of the strike of 1900.²

Some operators give reasons for the building of company tenements similar to those which are given for the establishment of company stores. It is declared to be necessary that the company furnish houses because the miners could not get them otherwise; it would be impossible without furnishing the houses to obtain the necessary labor. The representatives of the miners admit that this may be true in some cases; but they do not admit that it is the motive by which the operators are usually guided. They complain that the company houses are usually cheaply made, of boards straight up and down, not weather-boarded, and often not plastered. The water supply and other conveniences are said to be of the poorest. The conditions are alleged to be the worst in West Virginia, and best in the anthracite region. One miner declares that he knows of 5 houses in Ohio which were built in 1892 for \$95 each, and rent for \$5 or \$6 a month. It is asserted that in West Virginia the rent is usually about \$2 a room. One anthracite operator, while admitting that the company houses are not very satisfactory, holds that they are as good as can be furnished for the rent paid, and that, while private owners build better ones, they charge much more for them. The houses described by this witness are mostly of 2 stories, with 2 rooms on the lower floor, and the rent charged is \$6 a month, including a monthly ton of coal. The general superintendent of the Philadelphia and Reading Coal and Iron Company declares that while his company owns many houses it prefers to have the men live in the towns and villages, where it need not make provision for them, and that it arranges to have them transported by rail, even 10 and 15 miles, to and from their work, at a trifling charge.

The miners complain that influence is brought to bear upon them to make them occupy the company houses, and that the occupation of the houses is made a means of coercion in times of strike. A West Virginia operator admits that tenants are ordered out when they strike, but declares they are not compelled to live in the houses, and are not discriminated against if they do not; that 32 per cent of his employees own their own houses, and that in many cases he has given aid in acquiring them.³

HOURS OF LABOR AND OTHER CONDITIONS OF COAL MINERS.

It appears that in the bituminous mines of western Pennsylvania, in Illinois, Indiana, Ohio, and, to some extent, in other States, the United Mine Workers have been powerful enough to induce the employers to grant an 8-hour day. The representatives of the organization declare that the change has been beneficial to the health of the miners and to their mental and moral culture. Especial need of short hours in

¹ Robinson, 15, 16; Mitchell, 43, 44; Stephenson, 24, 25; McKay, 66, 68.

² Brooks, 160; Luther, 653; Loomis, 663; Marcy, 670; Mitchell, 700.

³ Robinson, 12, 16; Mitchell, 45; Schluederberg, 80, 81; Pearce, 98; Davis, 133, 134.

mining, because of the unhealthfulness of the work, is emphasized. Among other arguments for shorter hours, it is alleged, on the one hand, that they tend to the absorption of the mass of unemployed workers by diminishing the output per man, and, on the other hand, that a man can do as much physical labor in 8 hours as in 10.

An Ohio operator says that the 8-hour system is generally satisfactory to the operators as well as to the miners in his district. It has compelled the introduction of better machinery for handling coal, so that the miners can now produce about as much as they formerly produced in the longer day. Operators from Pittsburg and from Illinois, however, believe that the change has been injurious to them. A man can, they say, do only about four-fifths as much in 8 hours as in 10. It is a disadvantage to the operators that their machinery should lie idle two-thirds of the 24 hours. One of these witnesses admits, however, that the miner may produce as much during the year with the 8-hour as with the 10-hour day, because the work will be more continuous. The representatives of the miners also insist that even the machinery will be operated as many hours during the year, because it will be operated on more days.¹

In the anthracite mines a considerable irregularity of hours seems to exist. One operator declares that he has not 3 men out of 120 or 125 who will work 10 hours. His men usually work 4, 5, or 6 hours, and it is an exceptional one that works 7. A representative of the miners, on the other hand, asserts that the anthracite miners usually work 10 hours a day, and that they are sometimes compelled to work even more.²

The testimony of several anthracite operators is that the general condition of the miners has improved during the past 15 or 20 years. It is alleged that the foreigners from the south and east of Europe are adopting a higher standard of living. The same report is given by a bituminous operator of the Pittsburg region.³

The importation of the lower class of foreign laborers under contract by the proprietors of the anthracite mines is lamented by every witness who refers to it. It is agreed that such importations have now ceased. The influx of laborers from the south and east of Europe still continues, however, in full force. One witness believes that 60 per cent of the anthracite miners belong to non-English-speaking races. Another, an operator, states that the Irish, the Welsh, and the Germans are still the predominating nationalities in the region as a whole, though the Hungarians, the Poles, and the Italians have come in rapidly in recent years and outnumber others in certain districts. It is stated that the law of Pennsylvania prohibits any foreigner from working as a miner in the anthracite mines until he has worked there 2 years as a laborer to learn the business. This law is said to have been passed to keep out the Hungarians and similar classes, but the effect of it is alleged to have been to increase the number of them and to keep out the skilled miners from western Europe.⁴

Attention is called by the representatives of the miners to the special need of legislative interference to protect the miners from foul air and dangerous gases, as well as from accidents. The safety laws of Illinois, Indiana, Ohio, and Pennsylvania are said to be good, and the inspection under them is said to be thorough. One or two representatives of the miners mention the laws of Ohio as perhaps the best, though this opinion is not universal. Some of the miners complain of inefficient enforcement of the Pennsylvania law, chiefly because the inspectors are too few. Several witnesses call attention to the desirability of uniformity of legislation, in order that the operators in all districts may be put under the same burdens.⁵

⁵ Mitchell, 56; Schluederberg, 88, 89; Pearce, 103, 104; Brooks, 164, 165.

The use of mining machinery is steadily spreading in the bituminous mines wherever the use of it is practicable. One witness in 1899 estimated that 40 per cent of bituminous coal was already machine mined. Nearly all Pittsburg operators are said to use machines. The machines are used very little in the Massillon district of Ohio, and not at all in the northern district of Illinois. In the former case the nature of the coal veins does not permit the use of them. In northern Illinois the exclusion of them is attributed to the opposition of the miners.

The officers of the miners' organization plainly manifest their regret at the advance of machinery. They assert that it displaces labor, and they believe that it depresses wages. They deny, however, that the organization opposes the introduction of machines, and they admit that it is an inevitable industrial advance.

A Pittsburg operator states that 6 men with a machine can produce as much coal as 10 without it. The effect upon wages is a matter of dispute. It is admitted, even by the representatives of the miners, that the absolute number of miners has steadily increased. They maintain, however, that besides limiting the increase of the demand for men the machines reduce the proportion of skilled labor in the craft. Some witnesses believe that the increase of production and the employment of more engineers, firemen, etc., fully counterbalance any apparent displacement of miners by the machines. The secretary of the Illinois Bureau of Labor Statistics considers the improvement in machinery one of the chief causes of the increase of miners' wages during the last 30 or 35 years. This increase, however, is itself denied by other witnesses.¹

The use of machinery in the anthracite mines has not been found practicable. It is stated, however, that new machinery has largely replaced the labor of boys in cleaning the coal and preparing it for market.²

RELATIONS BETWEEN COAL MINERS AND THEIR EMPLOYERS.

The desirability of formal agreements between organizations of employers and organizations of employees, determining wages and hours and other conditions of labor for fixed periods, is a matter of general agreement among all the witnesses who refer to it. The organization of the miners, the United Mine Workers, seems to have promoted the formation of such agreements to the best of its ability, and to have been successful in establishing them in most places where it has developed great strength. The most notable of the joint conferences at which such agreements are periodically made is the interstate conference of the so-called competitive district, covering Illinois, Indiana, Ohio, and the western region of Pennsylvania, which determines the conditions of labor of perhaps 100,000 workers. An informal conference of operators and representatives of the miners' organization, covering the most of this region, was held as far back as 1885, and was repeated annually for several years. The custom was broken up, however, in 1889. The renewal of it followed the great strike of 1897. A conference was held in the spring of 1898, at which a formal agreement for the ensuing year was drawn up; and a similar conference has been held each year since. The conferences are attended by many operators and by representatives of each local union of the United Mine Workers. Each side and each State, however, has the same vote—the miners of each state 4, and the operators of each State 4. Every important decision must be reached by a unanimous vote—not by a mere majority. The actual formation of the scale is referred, after general discussion, to a committee consisting of 4 miners and 4 operators from each State. If an agreement is not reached, questions in dispute are referred to a subcommittee of 8 or of 16.

In Illinois and Indiana the operators have State organizations, each of which employs a paid executive officer called a commissioner, whose chief duty is to deal

¹ Mitchell, 54-56; Schluenderberg, 87, 88, Dalzell, 114; Mullins, 177; Ross, 185, 186; Justi, 684.

² James, 150; Luther, 651.

with the officers of the miners' organization. When any dispute arises the pit committee of the men and the pit boss try first to settle it. If they can not agree, the matter is appealed to successively higher authorities on each side until the State officials of the United Mine Workers and the commissioner of the operators' association are called in. Very rarely the national officers of the United Mine Workers are asked to help. The commissioner of the Illinois Coal Operators' Association acted in about 200 cases during the year previous to his testimony before the Commission. About 80 per cent of the cases, he said, were decided against the miners; they were more likely to be wrong, because their local organizations and their local officers were more likely to misunderstand the terms of the agreement. In all cases, however, they loyally submitted to the decisions.

There is no State organization of operators in Ohio or in Pennsylvania. In portions of Ohio there are local associations which employ a commissioner, and there is a conference in the central district of Pennsylvania. State agreements have been formed and State conferences established between the operators and the miners in Alabama, Kentucky, Tennessee, Missouri, Kansas, Iowa, and Michigan.

The president of the United Mine Workers asserts that since the adoption of the system of joint agreements wages have increased on the average fully 40 per cent in the States covered by the interstate agreement, and practically the same advantages have been secured in the districts where State conferences have been established. The 8-hour day has also been secured in nearly all these places. The semimonthly payment of wages in cash has been established, and where screens are permitted the size of them has been regulated. The commissioner of the Illinois Coal Operators' Association estimates the increase of wages in the competitive district, by the advance of 1900 alone, as probably amounting to nearly \$20,000,000 for the miners of the 4 States affected.

It seems to be agreed that the operators as well as the miners benefit by the agreement system. The number of disputes and strikes is greatly diminished, and the several districts and the several operators within each district are put upon a fairer basis of competition with each other. The uniformity of conditions which the agreements introduce is a matter of congratulation to those who are brought under them. It is complained, however, that the unorganized condition of West Virginia, and the consequent lower wages and longer hours that prevail there, put the other districts at a disadvantage. It is the desire of the operators outside of West Virginia, as well as of the organization of the miners, that the miners of that State be brought into the union, in order that the conditions there may be brought to a level with those of other States. It is asserted on behalf of the West Virginia operators that they do have a conference and an agreement with a local organization of miners; but it is alleged on the other side that this local organization is managed and supported by the operators themselves, and is not a genuine labor union.¹

Several strikes of coal miners, with their causes and results, are referred to in the testimony. The great strike of bituminous miners in 1897 is declared to have been caused by a single company, which refused to pay the rate of wages which was paid by its competitors. It is admitted by the operators that under the pressure of competition wages had been cut contrary to the agreement with the miners. The president of the United Mine Workers, however, declares that the purpose of this strike was to increase the price of coal and thereby to raise wages. Though the strike lasted 84 days, the earnings of the miners in that year are asserted to have been more than in the preceding.²

It is agreed by all witnesses who refer to the matter, including the secretary of the Illinois Bureau of Labor Statistics and the president of the Illinois Coal Operators' Association, that the strikes at Pana and Virden, Ill., in which so much excitement was caused by the refusal of the governor to permit the importation of colored labor,

¹ Robinson, 14; Stephenson, 20; Justi, 677-685; Mitchell, 698, 699.

² Mitchell, 36; Schluederberg 78, 79; Mullins, 173.

were caused by the refusal of operators to abide by the agreement which the association of operators had made with the miners' union, and by their subsequent refusal, after submitting the dispute to the State board of arbitration, to comply with its decision. It is stated that the governor did not maintain that he had the right to deprive a man of the privilege of contracting for his labor, and it is denied that the color question entered into the case. The governor held that the imported men were an undesirable class of citizens, and that it was illegal to bring them into the State under the protection of an alien armed body.¹

Several witnesses who testified before the great anthracite strike of 1900 declared that the last general strike of anthracite miners had taken place in 1888, and that the last before that was in 1875. The strike of 1900 is described by the president of the United Mine Workers. Only 8,000 of the miners are said to have been connected with the union before the strike. The strike involved 140,000 men and boys, and threw out of employment not less than 50,000 other people. It continued 39 days and resulted in the granting of all the miners' demands, it is said, except the official recognition of the organization.²

Several representatives of the miners complain of the practice of blacklisting, especially as directed against men active in organizing labor. The existence of the practice is not directly admitted by any employer, though one says he has heard of it. This witness declares his belief that no miner in his neighborhood has been blacklisted, at least in his time.³

SOCIAL QUESTIONS SPECIALLY AFFECTING LABOR.

Labor organizations.—The value and the necessity of labor organizations are asserted or admitted by all the witnesses who refer to the subject. There is general agreement as to their effect in raising wages, and their influence upon labor legislation is also referred to. The commissioner of the Illinois Coal Operators' Association holds that strong organizations of both employers and employees are necessary to successful arbitration and conciliation. The tendency to exert pressure on nonunion men to induce them to join is not denied, though the restriction of the pressure to legitimate kinds is asserted. Nonunion men benefit by the action of the union, it is said, and to refuse to join is meanness.⁴

The incorporation of trade unions is desired by several employers and others, on the ground that it would increase their responsibility and restrain the more radical element. One witness thinks it would make the property of the unions more secure. The idea is opposed by some representatives of the unions on the ground that the organization could then be held responsible for the breaking of contracts by individual members, and on the ground that the courts would sometimes be unjust in their decisions.⁵

Conciliation and arbitration.—All witnesses express their approval of methods of conciliation, and nearly all approve of some form of arbitration. Arbitration by a committee within the trade is preferred by several, and a considerable proportion of the witnesses place little reliance upon any action by the State. The existing State boards are usually regarded as of little moment. In some cases they are able to compose differences by conciliatory methods.

Compulsory arbitration is favored by several witnesses, mostly from Colorado and Utah. The representatives of the Eastern miners, with one or two exceptions, oppose it. Some witnesses who do not favor compulsory arbitration would approve of compulsory enforcement of awards when arbitration has been voluntarily entered into.

¹ Mitchell, 52, 53; Dalzell, 118; Ross, 178-180.

² Luther, 653; Mitchell, 700.

³ Mitchell, 37; Marcy, 671.

⁴ Ross, 185, 191; Smith, 212, 213, 223; Coates, 251, 252; Justi, 686, 687.

⁵ Stephenson, p. 19; Dalzell, pp. 116, 117; Ross, pp. 180, 181; Beaman, 273, 274, 286.

Others, on the other hand, desire an investigation of disputes by State authority, with compulsory attendance of witnesses, and in general with such procedure as compulsory arbitration would involve, but without the enforcement of awards. They would depend upon public opinion to secure obedience to the decisions of an impartial tribunal. While the possible necessity of resorting to imprisonment to compel the obedience of the workingmen to an award is one of the objections to compulsory arbitration, the complaints of actual refusal to obey awards under existing conditions are brought almost exclusively against the employers. Several cases are cited in which employers, after submitting disputes to arbitration, refuse to accept the result. No instance of similar action by workingmen is definitely cited.¹

Strikes and boycotts.—Most witnesses mention wage disputes as the chief causes of strikes. Special demands, such as relate to screens, docking, safety appliances, recognition of unions, and prohibition of joining unions, are regarded as of minor importance. One witness notes that strikes are most frequent immediately after labor unions are organized, and diminish as the unions grow older. One witness states that the real purpose of the great coal strike of 1897 was to raise the price of coal by restricting the production, and so to raise wages. One employer does not hope for a full end of disputes this side of the millennium, and one or two witnesses find the ultimate cause of strikes in the competitive system and in the control of land and machinery by a small class.²

Sympathetic strikes are defended in principle by several representatives of organized labor. They are declared to be particularly necessary among miners, because if one district is permitted to work while another is shut down, the first will supply the market of the other, and there will be a division of the profits among the proprietors, so that the strike will, in a great measure, lose its effect.³

The boycott is referred to only by representatives of labor, and by them is universally justified, though treated as a last resort, to be used only when the object of a strike can not otherwise be gained. The boycott is repeatedly compared with the corresponding weapon of the employers, the blacklist, and is declared to be more justifiable and less effective. The boycott is removed when the particular dispute is over; the blacklist remains.⁴

The representatives of the labor organizations universally deny that they sanction violence for promoting the purposes of strikes. It is admitted that abusive language may sometimes be used in arguments with workmen who displace the strikers, and that occasional cases of violence arise; but even abusive language is declared to be discountenanced by the leaders. The president of the United Mine Workers asserts that he knows of no instance where unlawful interference of striking miners has precipitated a riot, or where they have intimidated men from working. Violence is oftener precipitated, he asserts, by armed guards.⁵

Some employers fully approve the current use of injunctions against strikers, and consider that the opposition to it proceeds from demagoguery or from want of proper understanding. The representatives of labor, however, speak of the matter with great bitterness. They declare that the policy of the courts has done much to destroy the patriotism of the laboring people and to shake their faith in the judiciary and in the law. If a man is enjoined from committing a crime and is punished under the injunction, he is deprived of his right to a trial by jury. If he is enjoined, as men often have been, from walking peacefully along the highways, from holding public assemblies, or from attempts to advance his interests by argument and persuasion, he is deprived of the fundamental rights of a citizen.⁶

¹ Mitchell, 35; Pearce, 96; Davis, 131; Clark, 324, 325, 329; Sullivan, 349, 351.

² Stephenson, 21; Davis, 126; Ross, 181; Smith, 213; Coates 246, 247, 260; Beaman, 266.

⁴ Coates, 248; Sullivan, 350, 351.

⁵ Mitchell, 38, 39; Davis, 128, 129.

⁶ Mitchell, 38-40; McKay, 66, 67; Dalzell, 121; Ross, 183; Beaman, 275, 288, 289.

One or two witnesses consider strikes injurious to all classes, either always or in most cases. Among the representatives of labor organizations, however, there is no difference of opinion as to the necessity of them, however much the necessity may be regretted. Some of these witnesses manifest very clearly the disposition to regard the strike as an evil in itself, to be appealed to only as a last resort. All of them, however, agree that the condition of the working people, both organized and unorganized, is distinctly better than it would have been without strikes. Without strikes, it is declared, the joint agreements in the coal trade could not have been obtained. It is pointed out that to estimate the losses caused by strikes upon the basis of the days of idleness is radically erroneous. In coal mining, for instance, even a very prolonged strike may not increase the amount of idleness in the year. In 1897, when there was a strike of 78 days, the number of days worked was only from 1 to 13 days less in the different districts than in 1896, when there was no strike, and the amount of coal produced was greater.¹

Hours of labor.—The desire for a universal 8-hour day is generally expressed by the representatives of labor, and several of them are of opinion that the shortening of hours either tends to increase wages or at least does not tend to diminish them. Some express the feeling, however, that the 8-hour day should be obtained, even if somewhat serious concessions in wages are necessary.²

Machinery.—A sharp difference of opinion appears as to the effect of machinery upon the well-being of the workingmen. Some witnesses believe that it increases employment and wages and tends to decrease the hours of labor. Others hold that it throws men out of work and permanently diminishes the demand for labor. Such witnesses attribute the advance of wages, which is admitted to have taken place when a long period is considered, chiefly to the increase of education and skill. They believe, however, that by a reduction of the hours of labor the injurious effects of machinery can be remedied and perhaps turned to benefit.³

Convict labor.—Most witnesses agree that some sort of employment for convicts is desirable, for the good of the convicts themselves as well as to lighten the burdens of the taxpayers. There is an equally general agreement, however, that this employment ought to be such as to involve the smallest possible competition with free labor. Work on public roads and in the maintenance of the convicts themselves are the kinds of work most generally favored. Two or three representatives of labor declare that the workmen can better afford to maintain the convicts in idleness than to encounter their competition in work which free labor would otherwise obtain, and one goes so far as to advocate the withdrawal of the convicts from all employment and the occupation of them in reading and study.⁴

Child labor.—The employment of children in mines and factories is deprecated by every witness who refers to it. All agree that it checks the mental and physical development of the children themselves, and the representatives of labor add that the competition of children with men depresses wages and increases the number of the unemployed. In the most progressive States, it is said, the employment of children under 14 is now forbidden. Several witnesses desire the age to be raised to 16, and one would keep boys out of mines until they are 18. The development of machinery is asserted by some to have increased the employment of children, because a child can often tend a machine to substantially the same purpose as an adult. In the anthracite mines, however, it is noted that the new machinery in the breakers has, in a considerable degree, displaced boy labor. One miner thinks that the Pennsylvania law requiring children to attend school until they are 15 years of age has considerably diminished child labor in the mines.⁵

³ Ross, 186, 189; Smith, 226; Wright, 314, 315; Terhune, 605.

⁴ Ross, 188, 189; Coates 258; Sullivan, 350, 360, 361.

⁵ Mitchell, 46, 47; Davis, 135; McKay, 69; James, 149, 150.

Immigration, and importation of labor.—Several witnesses state that the injurious effects of immigration were more marked in earlier years than they are at present. It is generally agreed, however, that the continued coming of men of a low standard of life continues to press down the wages of American workmen. A desire for some sort of restriction of immigration is almost universal among the witnesses. Usually the restriction suggested is either an educational or a property qualification. The secretary of the Illinois labor bureau points out that the first concern of government in dealing with the matter should be to protect industrial interests, rather than merely to consider the character of the immigrants. A single employer doubts that immigration has depressed wages in any marked degree, and one representative of organized labor objects to any restriction of voluntary immigration, because he believes that every human being has a right to wander where he pleases upon the face of the earth. The president of the United Mine Workers, on the other hand, would prohibit immigration entirely for the present.¹

There are repeated references to the transfer of laborers under contract from one State to another, and especially to the importation of negroes from the South for the purpose of breaking strikes in mines. The representatives of labor have the same objection to this practice that they have to the earlier practice of importing European laborers for the same purpose. They complain that the laborers are frequently led into these contracts by false statements; by misrepresentation of the conditions of employment, and especially by denial that they are desired to take the places of strikers. Such false pretenses, it is maintained, should be prohibited by law. Some witnesses would have all importation of contract labor from one State to another prohibited.²

Cooperation.—It appears from the testimony that 2 Colorado coal mines have been run as cooperative enterprises, and that one is still run so, though the other has been bought out. It is said also that Colorado has a cooperative colony which has met with fair success. No wide application of the cooperative principle, however, is referred to. One employer doubts the possibility of it, on the grounds of the low general rate of business profits and the risk of loss.³

Employers' liability.—Increased pecuniary recompense to workingmen in case of accident is desired by several witnesses, to be obtained either by enlarging the liability of employers or by a system of public insurance. Some employers deprecate any attempt to burden them with the ordinary risks of the workingman's occupation. Some doubt is also expressed of the practical efficiency of employers' liability laws.⁴

TOPICAL DIGEST OF EVIDENCE.

[Prepared by E. DANA DURAND and CHARLES E. EDGERTON.]

I. CAPITAL IN WESTERN MINES.

A. Precious-metal mining.—1. *Colorado.*—Mr. GRANT, ex-governor of Colorado, says that it is difficult to compare the earnings of capital in the mining business in Colorado with the earnings of other lines of business. Comparatively few of the original owners and discoverers of mines invest large sums of capital. Each mine is developed largely from the profits taken out of it. But a very large amount of speculative capital enters developed mines, and it is impossible to estimate the average profits upon such investments. People invest in the hope of excessive profits.

The witness believes that the amount of capital invested in mining in Colorado is greater now than at any previous time. The mines, generally speaking, may be considered prosperous. For a short period during 1893 numerous mines were closed on account of the fall in silver, but improvements in processes have made it possible to operate them successfully. The introduction of the cyanide method of treating low-grade ores, the various improvements in smelting, the construction of drainage tunnels, deep shafts, and various conveniences for handling ore, and the use of electricity, especially in connection with mining machinery, have induced capitalists to take hold of properties which were formerly unprofitable. It is not now true that any mines are closed on account of low prices, although, of course, many unsatisfactory mines have been closed from time to time. Mr. Grant does not think there would be any more mines worked to-day if silver were worth 90 cents instead of 60 cents per ounce. Most mining camps have a variety of different precious-metal products mingled, and at least one of them is apt to be profitable.

It is impossible to estimate the average cost of production of ores or precious metals, on account of very great differences in the forms in which they are found and the richness of the mines.

One can not speak of overproduction and underconsumption of the precious metals in quite the same way as regarding other products. In one sense there is an underconsumption of silver shown in its reduced prices, and yet there is a market for every ounce of silver produced.

The mining interests of Colorado are much more widely scattered in locality than those of the neighboring States. The ownership is exceedingly diversified, and Colorado is especially a promising field for the poor man to mine in. For this reason combinations of mines seeking to raise the price of the precious metals are not likely to be practicable. (192-195, 198.)

Mr. LEE, mine inspector, Colorado, thinks that more money has been spent in Colorado in prospecting and developing mines, dealing with mining strikes, etc., than has been produced by the mines. The thousands of failures offset the great successes. Nevertheless the business is on the whole profitable, especially for those having large capital. There are men who keep a large number of prospectors constantly looking for mines, and they consider it a paying proportion if one good mine is secured out of 10 on which considerable money is spent.

There have been very great improvements in mining machinery and methods in recent years. In fact, Colorado has only commenced to develop its mining interests. Ores formerly worthless can be worked at a profit. There is an active demand for all of the different metals produced. (237, 241.)

Mr. HILL, of the Argo smelter, considers that the mining industry of Colorado is prosperous, though there are always a large number of mines that can not pay the cost of running them. There are more mines in the State paying very large profits to the owners than ever before. The profits of mine owners have been greatly increased by the improvements in the processes of treatment. These improvements

have increased the value of all ores, but in particular they have given a value to ores which could not otherwise be economically mined. The process of concentrating, depending on the greater specific gravity of the valuable parts of the ore, has made it possible to put the value of 10 or 15 tons of low grade ore into 1 ton, and then extract the metals by smelting the ton. If it had been necessary to smelt the whole bulk, the returns would not have paid the cost. (370, 380, 381.)

Mr. SMITH, deputy labor commissioner of Colorado, believes that the profits from mining in that State are probably, on the whole, greater than those of other industries. (224.)

2. *Utah.*—Mr. HANAUER, who is interested in Utah mines and smelters, says that the mining industry in Utah is generally prosperous, more so during recent months than it had been for years before. He attributes the increased prosperity to the investment of Eastern capital. The increased price of copper and of lead has contributed to it.

Mining is probably less prosperous and remunerative in Utah than in Colorado and Idaho. There has been no great change in the prosperity of the industry in Utah during the last 5 or 6 years. Some mines have come up and others have gone down. The amount of money invested in Utah mines has recently increased. (606.)

A mine in which 25 or 50 cents per ton can be made over all expenses is a paying mine. At such mines, producing low-grade ore, small differences of wages may make the difference between gain and loss. (608.)

Mr. Hanauer says further that silver mines are making more money to-day with silver at 60 cents than they made when silver was worth 90 or 95 cents. This is because of the reduction in cost of supplies and of machinery. (616.)

Mr. Hanauer also states that his experience gives a good deal of support to the old idea that more money is put into the ground in mining than is taken out. This idea does not correspond so well with the facts as it formerly did, because mining is done with better judgment and on a larger scale and with better appliances. Low-grade ores can not be worked except in a large way. Even the Calumet and Hecla copper mines in Michigan could not be made to pay, in Mr. Hanauer's judgment, if they were worked on a small scale. There is more hazard connected with mining than with manufacturing or mercantile business, but if it is successful the profits are usually greater. (606.)

Mr. THOMAS, State coal-mine inspector of Utah, says that there are a larger number of metal mines than of coal mines in the State, and he thinks the metal mines employ more men, though the difference in the number of men is not great. (628.)

Mr. ALLEN, manager of the Centennial-Eureka mine, Salt Lake City, thinks that capital in mining is better remunerated than formerly. Men have learned by experience and expend less haphazard and foolish work on mining. The returns are more certain. The improvements in methods of reduction have increased the value of ores and have given a value to low-grade ore for which the owners formerly received no return. (568.)

Mr. Allen states that even in the same camp the cost of production of ore may vary considerably. For instance, one mine may be wet and a neighboring mine dry. The cost of pumping would be a great additional expense. (577.)

Mr. CHAMBERS, a mine manager, of Park City, Utah, says that mining in Utah is prosperous, but not more remunerative than 25 or 30 years ago. There is more capital invested in metal mining in Utah, but not more men employed than 10 years since. (580.)

Mr. Chambers states that the advance in the price of lead has made a very great difference in the working of old mines and the opening of newer ones in Utah. (588.)

Mr. TERHUNE, a metallurgist of Salt Lake City, says that the mining industry in Utah is very prosperous, and that its earning capacity is much greater than in past years. (590.)

Mr. Terhune considers that with the present knowledge of the mining business investment may be made with a good degree of safety, if good judgment is used. The idea that mining investments are a kind of gambling is caused by a lack of knowledge of the subject. (596, 597.)

Mr. Terhune states that the arsenic in the ores treated in the Utah smelters runs from 0.03 to 7.4 per cent. Sulphur runs from 0.3 to 5.7 per cent. As depth increases in most mines the percentage of sulphur increases also. (593.)

3. *Idaho.*—Mr. BURBRIDGE, of the Bunker Hill mine, Wardner, thinks that the mining business in Idaho is thriving, and that the outlook is steadily improving. The use of improved machinery of different classes in and outside of the mines has enabled the development of much larger undertakings and has tended to increase the wages of labor and the number of men employed. It would be impossible, for

example, to work the Bunker Hill mine without a concentrator at the mine. It is still necessary for a considerable amount of lead ore to be imported into the Western States from Mexico and British Columbia for use in fluxing ores, but a material proportion of the lead made from such imported ore is reexported for the sake of the drawback. (458, 459.)

4. *Effects of demonetization of silver.*—Mr. CHAMBERS, manager of a metal mine in Utah, says that the demonetization of silver closed a great many silver mines. Few mines can now work unless they carry a by-product of the baser metals, as lead or copper. The purely silver mines were very largely closed by the demonetization of silver, both in Nevada and in Utah. Those who worked in them had to seek other camps or other occupations. Many located lands and went to farming, and many went into other kinds of work. What are called dry ores, carrying only silver, must either be of very high grade, bearing 50 to 100 ounces of silver, to pay for mining, or they must be exceedingly productive; that is, the veins must be large and easily worked. (580, 581.)

Mr. TERHUNE, of Salt Lake City, states that the demonetization of silver stimulated the development of other metals, particularly gold and copper. In 1898, 50 per cent of the value of the product of his smelter, the Hanauer smelter, Salt Lake City, was silver. In earlier years the proportion had run very much higher—perhaps 75 per cent.

The decline of silver has worked against high wages in Utah, and has been the principal cause, he believes, of their relatively low level there. (604.)

5. *Size and limits of mining claims.*—Mr. TERHUNE would increase the size of a mining claim to 1,500 feet square, or about 50 acres, and would then restrict its limits within vertical planes to the center of the earth. This would lead to greater caution and discretion in the establishment of boundaries than are demanded under the system of permitting a man to follow a vein. (603.)

Mr. ALLEN, a mine operator, states that while there are some local regulations which may cause the size of claims to vary, most mining claims in Utah are of the size fixed by the present United States statute, 600 feet by 1,500 feet, containing about 20 acres. (573.)

Mr. HAMMOND, secretary of state of Utah, says that the number of claims which one person can take should be restricted. He would consider 50 acres a reasonable amount for an individual, but would not think it wise to put it in the form of a square, 1,500 feet on a side, as has been suggested. While he would permit an individual to take only one claim of reasonable size, such as 50 acres, in one camp, he would not forbid the same individual to take other claims in other camps.

Mr. Hammond says that he has heard some discussion of the extralateral rights of owners of claims, and opinion seems to be somewhat evenly divided upon the question. (619, 620.)

6. *Consolidation of mining claims.*—Mr. ALLEN states that the present tendency in Utah is toward the consolidation of mines, the gathering of considerable tracts into the hands of one company. He believes that this is advantageous, at least in some cases. It makes it possible to mine low-grade ore, which could not be mined at all on the small scale, and so offers additional employment to miners. (573, 574.)

Mr. CHAMBERS, a mine manager, states that there is recently a tendency to the consolidation of mining properties in Utah, and that he thinks the result will be beneficial. He does not see how the interests of the miners or of independent owners of small claims can be injured. The consolidation of properties, by making it possible to work on a large scale, will lead to the development and working of mines of low grade and difficult character, which could not be worked by small separate owners. Among other advantages, he cites the example of the great drainage tunnel run by the Ontario mine. It cost this mine more to pump water than to hoist its ore. At one time it burned 112 tons of coal per day for pumping water alone. It has spent nearly \$700,000 in running a drainage tunnel between 3 and 4 miles long, and has not only drained its own mines but also all the other mines near it. This great economy could not have been effected except by a large concentrated capital. It is true that arrangements for contribution are often made in such cases with adjoining mines. None were made in the present case, because the neighboring owners were not producing when the tunnel was started, and did not know whether the prospecting would justify them in developing their properties. (582, 583.)

Mr. HANAUER, a smelter, does not see that the consolidation of mining claims has any bad effect; it has distinctly good effects in extending mining operations and making it possible to develop properties which could not be developed otherwise. A dozen claims may be developed with practically the same expense as one in some cases. Low-grade ore, which an individual owner could not mine at a profit, can be mined at a profit on a large scale. At Bingham, Utah, there has recently been a

large consolidation of claims, and Mr. Hanauer thinks the production of Bingham will soon be as great per day as it now is per week. There has already been a rise of wages there. (615.)

Mr. TERHUNE, a metallurgist, states that the consolidation of different mining properties eliminates the managing staff of some of them, but does not diminish the number of employees. It tends to stimulate mining. He seems, however, to believe that the social results of small separate properties are more desirable than those of great consolidated mines. Individual ownership and individual development are preferably to be preserved. (602, 603.)

Mr. BURBIDGE, of the Bunker Hill mine, Idaho, declares that the interests of the mining industry are promoted by bringing together different mines under one management. He does not believe that the smaller enterprises are in any way injured in this way. A great many promising mines can not be operated for lack of expensive machinery. A number of claims in the same vicinity, if brought together, will justify the construction of necessary mills and other works.

Generally speaking, the witness thinks that combinations of capital are not injurious to anyone. The lead trust, perhaps, injures producers of lead more than anyone else. Where a combination does not attempt to limit production and where by its economies it reduces the cost to the consumer it is beneficial even though some smaller enterprise may be harmed. (457, 458.)

7. *Machinery, mining.*—Mr. HANAUER states that improvement has been exceedingly rapid in the machinery for smelting, concentrating, and mining the ores of precious metals. Expenses have been reduced, prosperity of mining has been increased, and the demand for labor has been fully maintained. All interests concerned are benefited by it. (616.)

Mr. ALLEN, manager of a metal mine near Salt Lake City, states that mining machinery is used in his mine, and that it increases production and lessens the cost. He believes that it benefits the mine owner, the smelter, and the laborer. It increases the number of laborers employed, because many mines are now developed which it would be impossible to develop without machinery. (575, 576.)

8. *Limitation of copper production.*—Mr. HILL states that some years ago the copper production of the country was limited by the agreement of large owners. This is not now the case. For several years every copper-mine owner has been producing all he could. (375.)

B. Precious metal smelting.—1. *Growth of local smelters.*—Mr. HILL, of the Argo smelter, Denver, says that his smelter formerly did a large business in Montana ores. For many years it had the advantage of a method so superior that it could afford to bring the mattes from Butte, Mont.; but it can do so no longer. The Montana ores are now smelted near the mines. Again, a great deal of ore used to be brought from Utah to Denver. It is now smelted at Salt Lake City, and other places in Utah, at a charge no greater than the freight to Denver. The Argo smelter is therefore compelled to confine itself to local or Colorado ores. (382.)

2. *Charges for smelting.*—Mr. HILL states that the capacity of the Colorado smelters has for several years been greater than could be used with the available ore. A large proportion of the ore that has been handled is of low grade, and the price of it has been determined by the need of inducing the owners to take it out. A great deal of ore has to be handled at a price which really gives the smelter no profit. (370.)

Mr. DOYLE, a director of the Portland Gold Mining Company, states that the bookkeeper of the Independent mine, adjoining the Portland, told him that the Independent ore was treated by the Omaha & Grant smelter for \$2.85 less than the same smelter charged the Portland, and that in his opinion the smelter paid somebody a rebate of \$2.85 on the Portland ore. The witness believes that such a rebate of \$1.85 is paid at present. (367.)

3. *Methods.*—Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that the methods of smelting have improved rapidly; that there has been a vast improvement even in the last year. The improvement has been largely metallurgical. Mechanical roasters have been introduced into the smelters and have displaced labor. By decreasing the cost of treatment of ore, however, these improvements have increased the demand for mining labor. The witness believes that they have caused more labor to be employed upon the whole. (298.)

Mr. HILL states that when his works were first built in Blackhawk, Colo., it was thought that the whole mining field there would soon be deserted. There had been on the surface a class of ore that could be worked in the stamp mills; but when the miners passed a certain depth they found ore that would not yield gold in the stamp mills. A good deal of money had been spent in the unsuccessful attempt to treat these ores. Mr. Hill's smelter supplemented the stamp mills by taking a grade of ore which they could not use profitably. The general market thus

afforded for ores make the mines prosperous, and in three or four years a large number of stamp mills were again running successfully. (379, 380.)

Mr. Hill states that there has been a very great decrease in the cost of reducing ores of the precious metals, due to the reduction of transportation costs and to the introduction of improved machinery. The benefit of these economies has not accrued to the owners of the smelters. It has gone largely to the owners of the mines, and in some degree to the consumers of the metals. The reduction of the value of the metals affects the smelters favorably in reducing the amount of capital needed to carry on the business. The better prices for ores help the smelters by giving them a fuller and better assortment. (370, 374, 375.)

Mr. Hill states that when he first built his smelting works at Blackhawk, Colo., he paid \$1 apiece for fire brick, and 23 cents a pound for the iron that was used in construction. These high costs resulted from the situation of the plant. Everything had to be carried in wagons from the Missouri River. Wages were fully double what are now paid for the same work in Denver. This was largely, though not altogether, due to the very high cost of living. Notwithstanding the high costs, profits were greater in those days than now. (370, 378, 379.)

Mr. ALLEN states that the greater part of Utah ores are reduced by smelting. The ores of the Mercur district are extracted by the cyanide process. Some gold ore at Bingham is reduced in a small way by concentration. (579.)

Mr. WRIGHT says that the free-milling ores are not smelted. The greater the amount of the more refractory ores that is mined, the busier the smelters are, and the more money the companies make. When the copper and lead ores are plenty, the companies can get a better class of smelting ores and can adjust their ores better. Of the four metals, gold, silver, lead, and copper, nearly all the refractory ores carry at least two, and many carry them all. Copper, lead, and silver were all relatively high in price at the time of the witness's testimony, and the smelting industry and the mining industry of Colorado had been very prosperous up to the time of the smelters' strike. (310, 311.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that this company used to bring in a great deal of ore from Mexico to its Pueblo plant, but has brought a very little since the establishment of its smelters in Mexico. Its chief supply of lead and copper ores comes from Utah. It used 7 000 or 8,000 tons of Idaho ore in 1898. With the increased prices of lead has come an increased production of lead ores in Colorado and elsewhere. (295.)

4. *Combination in cyanide process.*—Mr. HANAUER states that no effort is being made, to his knowledge, to consolidate the cyanide-process plants. It would be useless unless the mines were also bought. A cyanide plant is valueless without the mine. (615, 616.)

5. *Farmers as smelter men.*—Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, states that a considerable number of men worked for the smelter in the winter and upon their farms in the summer. These men would, perhaps, make up 20 per cent of the winter force of the smelter. This resulted in a scarcity of labor in the summer. (595, 596, 603.)

C. American Smelting and Refining Company.—1. *Organization and plants controlled.*—Mr. GRANT, general manager of the American Smelting and Refining Company, testifies that it was incorporated, in the State of New Jersey, in April, 1899. The practical management is in the hands of an operating committee. The witness implies that the preferred stock of the smelters' combination covers the full cost of constructing the various plants, and that a limited amount was also reckoned for good will. The common stock is thus to be considered bonus. The combination includes seven smelters in Colorado and also smelters in Salt Lake City and Omaha. There are two strong independent smelters in Colorado. (194.)

Mr. COATES says that the American Smelting and Refining Company, commonly known as the smelters' trust, has one establishment in Kansas City, two in Omaha, two in Denver, two in Pueblo, one in Leadville, one in Durango, and, he thinks, three in Utah, close to Salt Lake City. He supposes that they have some refineries in the East. There are only two independent companies operating smelters in Colorado. Mr. Coates does not believe that the organization of this trust will produce beneficial results to any but stockholders. (253, 254.)

2. *Capitalization.*—Mr. HANAUER, who sold the Hanauer smelter to the trust, states that he received \$200,000 in preferred stock and \$140,000 in common stock, besides cash for materials and supplies on hand. The plant cost "from first to last \$173,000," but could be duplicated for less. The estimated value of the plants absorbed was based largely upon their past earnings. (613, 614.)

Mr. CHAMBERS says that some of the smelters bought by the trust were put in at two or three times their value. He fears that the trust will try to make the miner pay for it, and furnish a dividend on the entire capital. (589.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, which was absorbed by the trust, holds the opinion, based on what the trust paid for the three Salt Lake City plants which it absorbed, that its plants could be duplicated for one-fourth of the nominal capitalization. (600.)

3. *Objects and advantages of combination.*—Mr. LEE, commissioner of mines of Colorado, says that the recent combination of smelters was largely forced by the competition of the large Guggenheim smelters. The Guggenheim concern is not a trust in the ordinary sense, the ownership being practically in one large family, which owns a smelter in Mexico, one in Trenton, N. J., and by far the largest plant in Colorado. The capital back of these smelters is perhaps \$125,000,000, while the smelters in the combination have only about \$85,000,000. The Guggenheim smelters have secured a very considerable control over the lead ores by paying premiums on them.¹ Proper lead ores are essential in the fluxing process. All other smelters, so long as they competed among themselves, were unable to secure sufficient lead ore. For a number of years they had declared no dividends. It is understood that the Grant smelter controlled a large proportion of the lead production of Idaho, and the other smelters by combining with it will be able, by dividing up the available ore among different plants, to compete more effectively against the Guggenheim smelters. (238, 241.)

Mr. GRANT says that the cause of the combination was the ruinous competition which had existed. Smelters can nowadays be built rapidly, and it was impossible to make a profit under the conditions formerly existing. It was believed that various economies could be effected and that labor as well as capital would be benefited. At the same time it was hoped to secure somewhat higher prices by limiting the competition. In particular the combination proposed to make use of the most favorable locations for its plants, abandoning various smelters which had been unfavorably situated.

Aside from the economy secured in this way, and from the use of improved methods, it was expected to derive advantage from having a wide control of different classes of ore. No single mine furnishes just the right kind of ore to make proper and economical smelting mixtures, and any one plant is at a disadvantage in securing the right ores. (194-199.)

4. *Effects on competition, prices of ore and products, etc.*—In view of the circumstances leading to the formation of the combination, Mr. LEE thinks that the "smelters' trust" will be advantageous to ore producers. The premiums which have heretofore been paid for lead ore have practically been charged to the mine owners in higher rates for treating their ore, and these rates can be lowered by the advantages of the combination. Moreover, on account of the element of transportation, the smelters must continue to be located in numerous places near the source of ore, and this will prevent such complete control over the plants as would be possible if business were concentrated in large centers. If the combination should close any of its plants permanently, independent capital would be likely to establish plants at such places. Moreover, the competition of the two great separate concerns which now exist prevents the injurious effects which might come to mining interests if there were only one combination.

Similar considerations, the witness thinks, apply as to the effect of the smelters' combination on labor. While it would be possible for the combination to close some of its plants and thus injure laborers who have established their homes there and also exercise undue control over them, such a course of action is hardly probable. Too much capital is invested in the plants to allow them to lie idle, and local treatment of ore is most economical. (238-241.)

The combination will not probably have any effect, Mr. GRANT thinks, in depressing the price of ore to the miners. The widely scattered ownership and location of the mines especially operates against this. The small mine owner will get as good prices for his ore at the smelter as the large owner. It is hoped, however, to exercise some control over the prices of the finished product, especially in the case of silver and lead. The demand for silver is always active, and yet at times conditions have been such that the smelters have sold large quantities at several cents below what they knew the proper market price should be, the dealers in London, especially, reaping the advantage. Although it would not be possible to limit the production of ores, or permanently to restrict the output of the smelters, a corporation with a great capital can afford to carry a considerable quantity of its output and dispose of it at the most favorable periods, as a smaller concern could not do. The witness thinks it is perfectly defensible thus to regulate supply within reasonable limits. (194-199; 202, 203.)

Mr. HANAUER, recently owner of the Hanauer smelter, Salt Lake City, which was sold to the trust, does not think that the combination is strong enough to prevent

¹ Since this testimony was given a combination of the Guggenheim concern with the American Smelting and Refining Company has taken place.

healthy competition. Some of the plants of the trust will be dismantled and the business will be concentrated in a smaller number of establishments. His own plant, and doubtless others, were running at one-third of their capacity before consolidation. It is much more economical to run a smaller number of plants fully. The trust can not keep competition out of its field except by holding its charges for the treatment of ore low. Mr. Hanauer believes that this will be its policy. (612-615.)

Mr. Hanauer states that besides the Argo smelter at Denver and the Guggenheim at Pueblo, there are independent smelters at San Francisco, at Everett, and at Tacoma or Portland. A man with capital and experience would have no difficulty in running a smelter in opposition to the trust, especially as a plant could now be built for much less than the cost of building the syndicate plants. (614.)

Mr. CHAMBERS, a Utah mine operator, does not think that the formation of the smelter trust has hurt mining enterprises in Utah. Such a combination is dangerous, however, to the interests of the country. It has a power which is liable to be abused. It may dictate the price of labor at the smelters, and in some degree the prices of ores. It may discriminate in price between ore producers. It might be able to close some mines entirely. It so narrows the opportunities for employment that the smelting laborers may have to submit to the dictates of the trust or to find some other occupation, and the effect upon the ordinary small producers of ore may be very similar. There would probably be a tendency to dismantle some of the works, so desolating places where they had stood, and compelling men to seek other homes. It tends to the congestion of population in great centers. (583.)

Mr. Chambers refers to the shutting down of one of the three smelters owned by the trust near Salt Lake City, and regards such operations as a serious evil resulting from the formation of industrial combinations. A little settlement has grown up around every such institution, the men have their little homes there, and when the institution closes the home is desolated and the value of it is destroyed. The tendency must be to produce bitterness and immorality. (589, 590.)

Mr. TERHUNE, a metallurgist, states that in the case of the smelter trust no tendency to the congestion of population is probable, as the situation of smelters is determined by geographical laws. Many low-grade ores will not bear shipment, and the smelters have to be placed at suitable points for treating them. The trust will be able to close some plants and by such means to effect some economy. (601.)

5. *Effect on labor.*—(See also as to strike of 1899, p. LVIII.) Mr. HANAUER, who sold the Hanauer smelter, Salt Lake City, to the trust, states that this smelter is closed, but that the neighboring Germania smelter has doubled its force, so that the Hanauer men have found employment there. The closing of some smelters by the trust does not diminish the number of workmen that are needed. It does displace some superintendents and clerks, though some of the office men of the Hanauer were taken in by the Germania. (613.)

Mr. ALLEN, a Utah mine manager, states that the so-called smelter trust owns three plants in Salt Lake County and has closed one of them, presumably for purposes of economy. The men employed have not been thrown out of work. One of the trust smelters near by has been enlarged and has absorbed some of them, and others have got work with a neighboring independent smelter. (574.)

Mr. COATES understands that Mr. Grant, one of the officials of the trust, has said that if the profits were increased as a result of the combination the laborers should share equally. He thinks that labor would share equally if Mr. Grant were in control, but he does not think that the trust will allow Mr. Grant to carry out his desire. (260.)

Mr. GRANT admits that the possibility of closing part of the plants of the combination, to resist a strike or for other reasons, will be likely in the future to make men timid about building homes in connection with the smelters. In fact, the tendency of the combination will probably be to consolidate its business in a few large cities. Mr. Grant admits, also, that the individual workingman may find himself at a disadvantage in securing employment owing to the combination. If he were discharged for some violation of the rules at one plant he might also be excluded from the others. So far, however, Mr. Grant does not think that the combination has found that it will be possible to dispense permanently with any part of the employees. (201.)

6. *Philadelphia Smelting and Refining Company.*—Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that this company is a corporation, with a capital stock of \$1,125,000. The cost of construction of its works is nearly \$1,250,000 and the running capital employed is a good deal more. The stock is all owned by M. Guggenheim Sons, of New York—seven brothers. The Pueblo plant smelts from 20,000 to 23,000 tons of ore per month. The company has another plant at Perth Amboy, N. J., and two in Mexico. (294, 295, 298, 299, 304.)

D. Conditions of capital in coal mining.—1. *Coal deposits.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that there are about 18,000 square miles of coal area in Colorado. There are two distinct classes of coal, one in the north and one in the south; they are different coals and used largely for different purposes. The area is so great, and so tempting to new competitors, as to keep down the profits of mining companies. (270, 273.)

Mr. SHARP, superintendent of the Pleasant Valley Coal Company, estimates the coal deposits of Utah at 2,000 square miles. Perhaps 4 or 5 square miles have been opened. The Castle Gate mine vein averages 5½ feet thick. Other veins are 11 feet, 14 feet, and 28 feet thick. The present production is about 600,000 tons per annum. The quality of coal is believed by the witness to be as good as that of the Pennsylvania bituminous. He states that the Castle Gate coal is similar to the Canyon City coal of Colorado. The Utah coal slacks badly, however, and it is not customary to mine at any time more than 30 days' supply ahead. (637, 638, 643.)

1. *Prosperity of coal mining, Utah.*—Mr. CALLIS, county attorney of Summit County, Utah, says that capital is safer in coal mining now than 12 or 15 years ago, but on account of fierce competition profits are not so great. (630.)

Mr. SHARP states that the capital and labor employed in coal mining in Utah are about five times as great as 15 years ago and three times as great as 10 years ago. The prosperity of the business has increased. (638.)

Mr. THOMAS, State coal mine inspector of Utah, says that the returns to the operators of Utah coal mines are not quite as great as they were 10 years ago. This is due to the fall in the price of coal. (623.)

Mr. THOMAS said further that the industry was relatively dull at the time of his testimony, August 5, 1899, and that the output was then about 2,500 tons per day. The industry is generally prosperous. The coal is marketed in Utah and on the Pacific coast. The product is bituminous coal not of a high grade. Coal has been mined in Utah for over 40 years, and the product is constantly increasing. The coal beds of the State are exceedingly large. (622, 623.)

3. *Ownership of coal mines.*—Mr. BEAMAN states that the Colorado Fuel and Iron Company owns some of its mines and leases some. The royalty on leases is sometimes 10 cents per ton—sometimes more, sometimes less. (265.)

Mr. SHARP states that the mines at Coalville are the only coal mines in Utah in which no railroad company is interested. (643.)

Mr. THOMAS, State coal mine inspector of Utah, says that nearly all the coal mines of that State, and all the best, are worked by companies affiliated with the railroads. Freight on coal is kept very high. Mr. Thomas's estimate is \$1.75 to \$2 per ton for a haul of 80 or 90 miles. (624.)

4. *Coal markets.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that his company does not export any coal. It did sell some anthracite in California, but that trade is cut into by the anthracite that comes over in ships as ballast. A very large amount of Colorado coal goes into the adjacent noncoal-producing States. (269, 280.)

Mr. SHARP says that the Utah mines depend for their markets upon the railroads and the demand for steam making and for domestic use in Utah, and also in California. The Wyoming mines are the chief competitors. (638.)

5. *Sizes of coal.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that where coal is screened the screenings will run about 40 or 50 per cent of the total production. There is sometimes a demand for nut coal, but it is usually a very light demand. The company sometimes makes pea coal also. There is no market for slack, although much of it is used for coking. (292, 293.)

Mr. CLARK states that by successive screenings the coal in his part of Colorado is separated into lump, nut, pea, and slack. All of these sizes of coal find a market, the slack being used for running furnaces of heat and power plants. (330, 331.)

E. Colorado Fuel and Iron Company.—1. *Extent of business, etc.*—Mr. BEAMAN, secretary and general attorney of the Colorado Fuel and Iron Company, states that this company was organized October 22, 1892. It has 11 coal mines in Colorado that were in operation at the time of his testimony, July 14, 1899, and 7 which were not in operation. It has 5 coke plants in Colorado and 2 in New Mexico, all of which were in operation. It has 1 iron mine in Colorado and 1 in New Mexico which were in operation, 1 in Colorado not in operation, and 1 in Wyoming that was being opened. It has also a large steel plant at Pueblo. Its taxes average about \$50,000 a year. It does not insure its property, finding it cheaper to carry its own risks. It employs about 6,000 miners and mine laborers. It sells its coal in Colorado, Kansas, Nebraska, Utah, New Mexico, old Mexico, Arizona, and Texas, and coke and sometimes coal in Idaho and Montana. Its output of coal for the year ending June 30, 1898, was about 2,630,000 tons. It made about 322,000 tons

of coke. It is not mining any coal outside of Colorado, though it sells the output of some New Mexico mines. (261, 265, 266, 268.)

2. *Capital and dividends.*—Mr. BEAMAN states that the capital of this company is \$13,000,000, of which \$2,000,000 is preferred. The capitalization was reduced when the present company was formed by consolidation. He denies that there is any water in the company's stock, though the answer to the question whether the face value of its stock represents actual investment would depend upon the valuation of its land. It has about 70,000 acres of land, the value of which depends upon how much is coal or iron land, and that is largely speculative. The company has paid three dividends on its preferred stock, and only one dividend, of 1½ cents, in 1893, on its common stock. (269, 294.)

3. *Effects of combination.*—Mr. BEAMAN states that the Colorado Fuel and Iron Company was formed in 1892 by the consolidation of the Colorado Coal and Iron Company and the Colorado Fuel Company, together, apparently, with the Denver Fuel Company and the Elk Mountain Fuel Company. There had been sharp competition between the Colorado Coal and Iron Company and the Colorado Fuel Company in the coal and coke business. One of the great benefits of consolidation was the stopping of this competition. Mr. Beaman does not consider that the consumers were injured, although prices had formerly been frequently cut. The companies are benefited by saving the expense of two separate organizations, with their agents and officers. The miners also were benefited. No mines were shut down as a result of the consolidation. The rates of wages were not reduced during the panic of 1893, and the witness thinks they could not have been maintained without the consolidation. He admits that the small companies which compete with his probably pay the same wages, but he says he knows of only two small companies which were operating in southern Colorado in 1893. He does not think that wages were reduced by these companies. (268, 269, 294.)

Mr. Beaman says that he can not explain how numerous small companies can compete with his large organization, in spite of the economies which, he states, come from consolidation. They may have coal easier to mine. He does not know what the wages or the profits of the small companies are. The small companies are numerous, and the number of them seems to be constantly increasing. (269, 270.)

4. *Agencies.*—Mr. BEAMAN states that the company's product is sold through agents who have a monopoly, each in his own town. These agents may perhaps fix their profits themselves, or they may be subject to some regulation from the company as to prices. They make from 50 cents to \$1 a ton, "and they get about the biggest slice out of it of anyone." He regards this system of local monopolies as necessary. A business in which there are agents could not be run in any other way. (267, 272.)

F. Petroleum industry of Colorado and Wyoming.—1. *General conditions in Colorado field.*—Mr. HILL states that the old wells around Florence, Colo., are constantly falling off in their production, and many of the new holes do not produce any oil. The drill is always put down 2,500 feet. There is nothing at the surface to indicate where oil will be, and for the last year about all the profit in the business has been consumed in drilling holes. The Florence wells supply the oil of Wyoming, Colorado, New Mexico, Utah, Arizona, and Montana. The quality of the refined oil is fully up to that of the best of that produced in the East. (375.)

Mr. JOHNSTON, an oil producer, of Florence, Colo., states that oil was first discovered in paying quantities in that district about 1885. The quality is much inferior to that of Pennsylvania oil. The present production is probably more than 1,000 barrels per day. (338, 346.)

2. *Petroleum in Wyoming.*—Mr. JOHNSTON states that he made a somewhat extensive examination of Wyoming oil lands some 2 years ago. The Salt Creek Works were practically the only petroleum works then producing in Wyoming. The oil produced there is an excellent lubricating oil. No illuminating oil is made from it. The lubricating oil is supplied to the Denver and Gulf Railroad. (340.)

3. *Operations of the Standard Oil Company in Colorado.*—Mr. HILL, of the United Oil Company, states that when he went into the oil business in Colorado he succeeded in joining a number of small oil-refining companies into the United Oil Company. He found that the Continental Oil Company, controlled by the Standard, was in the field as a distributor of oil. It had an extensive plant of storage tanks, tank cars, etc., which it would have cost several hundred thousand dollars to duplicate; and the duplication would have been a waste of capital, and would have simply meant destructive competition between the two companies. Moreover, the Standard could crush its smaller competitor whenever it chose. "They could make the railroads carry oil from Chicago, and sell it here for a price that would destroy our business. They have the power, I think, to do that at any time, and we have no independence in that matter at all." It seemed wisest for the United Oil Company to make an

arrangement with the Continental for the sale of all its refined product. Such an arrangement was concluded and exists to the present time. The Continental Oil Company always pays the Chicago wholesale price, plus the freight from Chicago. At times when there have been cut rates the Continental has not insisted on a corresponding cut in Colorado oil, and so has paid even more than the Eastern price, plus the freight. Another small company at Florence has the same arrangement with the Continental. Mr. Hill understands that the Standard has never treated any other competitor with the same lenity. It has always been its policy in other cases to crush out independent refiners, and to insist on buying the crude oil and refining it itself.

After the arrangement had been made with the Continental Oil Company by the United Oil Company, the Rocky Mountain Oil Company built works at Overton, near Pueblo, and went extensively and extravagantly into the petroleum business. It tried to manufacture products like paraffine wax and a fine quality of lubricating oil. Mr. Hill attributes the failure of this company to bad judgment and bad management. He admits, however, that prices were very sharply cut by the Continental Oil Company, and by the United Oil Company, under its selling agreement with the Continental. "We cut the price in order that the other company might not come in * * * and thus destroy our field." He has heard it stated that the Standard Oil Company had advantages over the independent company in the reductions made at that time, and he has also heard it denied. He does not know whether it is true or not. "I know they have very great power over the railroads, growing out of the immensity of their business." After the Rocky Mountain Company had been compelled to give up the refining business, Mr. Hill and his associates handled the Rocky Mountain Company's oil under the name of the Western Oil Company. (375, 376, 385-387.)

Mr. HILL says that he regards the prices exacted by the Standard in Colorado as excessive in comparison with the prices which it pays to his company. The oil is delivered at retail by wagons, and the retail price is about 20 cents per gallon. Mr. Hill admits that the cost of retail distribution is considerable. (386.)

Mr. JOHNSTON, a Colorado oil producer, states that the refining of petroleum in Colorado was controlled by several independent companies up to 3 or 4 years ago. At about that time the retail price of oil was cut from some 20 cents to 5 cents at Florence. The witness supposes that the cut was made by the Standard when the Rocky Mountain Oil Company, an independent company, put its oil on the market. The Standard must have brought its oil at least from Whiting, Ind., about 1,000 miles away. An arrangement was afterwards made between the independent companies and the Continental Oil Company, which is supposed to be the western branch of the Standard Oil Company, under which the Continental buys the whole output of the independent refining companies, and in this way controls the marketing of the whole Colorado product. The Standard does not produce crude oil in Colorado, and it sets no limit to the amount of crude that shall be produced. The field is now producing all that it is capable of producing.

Mr. Johnston thinks that the profits of the oil producers in Colorado are about the same as before the Standard got control of the business, and that the retail prices are about the same as before the cut. The cut price of 5 cents per gallon was below the cost of production. He does not think that the cut was made for the purpose of increasing prices through control of the product. He thinks the purpose was "to compromise in some way whereby each company could market its product at a fair price." The companies were, however, selling at a fair profit before the cut was made, and he is not prepared to explain why the cut was necessary in order to secure a compromise under these circumstances. He suggests that when a new company comes into the field of an established business and divides the market, the old company's profits are reduced because of its diminished business, and "the object might be a compromise between the two whereby a price could be fixed at a reasonable profit, and each sell its own product." He admits that the cut in prices was due, in his opinion, to the efforts of the larger and stronger corporation to destroy the smaller and weaker ones, with the end in view of advancing prices when competition was driven out. The contracts with the Continental Oil Company are of advantage to the producer in that they furnish a steady market at a fixed price. There is no change in the circumstances of the employees.

The witness speaks of the town of Overton, 6 miles from Pueblo, which was built up by the establishment of a refinery there by the Rocky Mountain Oil Company, which constructed a pipe line from Florence. After the arrangement was made with the Standard the Overton plant was dismantled, and the town is now absolutely depopulated. The pipe line is no longer used.

Mr. Johnston thinks that the operations of the Standard Oil Company in Colorado

have not done any harm except in crushing the independent refiners out of business and throwing some intermediary men out of employment. (338-343, 346.)

4. *Freight rate discrimination.*—Mr. JOHNSTON says that the general manager of the Rocky Mountain Oil Company told him at one time that it cost that company \$1.87 per barrel to ship oil from Overton, Colo., to the Pacific coast, while it cost the Standard Oil Company 87½ cents to ship from Whiting, Ind., to the Pacific coast, a distance about 1,000 miles greater. (343, 344.)

Mr. Johnston believes that there is discrimination in freight rates in favor of the Standard Oil Company, the elevator combination, and other like organizations, but his knowledge in that regard, he admits, is very limited. (345.)

5. *General effects of Standard Oil Company.*—Mr. JOHNSTON considers that the effect of the operations of the Standard Oil Company has generally been beneficial. It has given the public a much better and cheaper grade of illuminating oil. Hardship has been wrought to the independent manufacturer, and the witness admits that a great combination that works such local hardship as that which resulted from the depopulation of the refining town of Overton, Colo., destroying the value of all property there, is likely to work hardship generally and is not a good thing from the point of view of public policy. He admits also that the petroleum industry might have flourished just as well if there had been no Standard Oil Company. The witness's opinion as to the effect of the Standard upon the price of crude oil is not clear. He seems to say that the producers would receive a lower price if the market were open, and again that the producers are receiving a lower price from the Continental Oil Company, which represents the Standard in Colorado, than they would get in the open market. He states, however, that the arrangement with the Continental Oil Company gives satisfaction to the producers. (339, 340, 342.)

Mr. Johnston states further that he has seen a good deal of the dismantling of refining plants in Pennsylvania. It is the general policy of the Standard to buy up competing plants and dismantle them in order to get competitors out of the business. The small plants are dismantled for the sake of economy; the Standard can produce cheaper in its large plants. The witness is not prepared to explain why it is necessary to buy up competing plants if oil can not be produced in them as cheaply as in those of the Standard. (343.)

6. *Petroleum—causes controlling prices.*—Mr. JOHNSTON states that the price of crude oil in Pennsylvania fluctuates very greatly, presumably because of variations in the output and the demand. Variations in the price of crude oil have in recent years followed variations in the foreign price of refining, and it has been possible to foresee them by observing the course of the London market. (345.)

G. Discriminating freight rates on mining products.—(See also as to general principles, p. CLXIV).—1. *Precious metal ores.*—Mr. DOYLE states that he is one of the directors of the Portland Gold Mining Company, which operates the Portland mine, one of the richest in the Cripple Creek district. The ore from this mine is nearly all shipped to the Omaha and Grant smelter at Denver. The distance is about 140 miles. The freight rate is about \$5 per ton; no less now when the ore is loaded on the cars at the mine than it was when the ore was hauled the first 25 miles in wagons. There are two roads over which the Portland ore could be shipped to Denver. All the ore goes by one of these roads. Mr. Doyle and one other of the five directors of the Portland company desired the shipments to be divided. In the course of the discussion of the matter, it was discovered that the railroad was paying a rebate of \$1.50 per ton, which the president of the Portland Gold Mining Company was putting in his pocket. For the year 1896 the whole amount of these rebates was some \$50,000 or \$60,000. None of this money was divided among the stockholders. In consequence of the discovery of the rebates, and in consequence of Mr. Doyle's protests, one month's rebates were divided among the directors; Mr. Doyle got \$1,000. He learned from the statements of stockholders and employees of other companies that all the larger mining companies in the Cripple Creek district were receiving rebates. Ninety per cent of the ore that could be shipped was shipped to Denver, because the rebate netted the shipper more than did the value of the ore. The small individual miners, he believes, received none. He considers this a serious injustice. The burden is removed from the shoulders of those who are best able to bear it and placed upon the weakest. He and one other director of the Portland Gold Mining Company protested against the rebate practice. They had a petition drawn up for a receiver for the mine, but the petition was never filed. Mr. Doyle has no actual knowledge of the payment of rebates at the present time, but he believes that the practice still continues. He believes that the receipt of rebates is as common in other branches of industry as in mining; that there are merchants in Denver who do not make a dollar on their goods, but live off their rebates. (364-368.)

Mr. GRANT, who is connected with the smelters' trust and interested in various mines, declined to answer a question as to whether discriminating rates on railways were received by the smelters or the mines. (194.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that that company pays the tariff rates as published by the railroads. He has no further knowledge of the freight situation. (300.)

Mr. HILL, of the Argo smelter, states that his company has never asked for any discriminations. It has often asked for reduced rates on low-grade ores in order to enable them to be shipped, and the reductions have often been granted; but Mr. Hill has no reason to believe that they were not open to everybody. He has many times had suspicions that very unreasonable and unfair discriminations were made, but he has seldom had any positive proof of it. He is very strongly opposed to railroad discriminations. (373.)

Mr. SMITH, deputy labor commissioner of Colorado, believes that there are very considerable discriminations in freight rates as between places and individuals in Colorado, and that they have an injurious effect upon labor, as well as upon merchants and producers. Dealers in the vicinity of Leadville claim that they are discriminated against as compared with Montana and Utah points. The witness has heard it frequently said that the smelter combination enjoys advantages in freight rates over independent smelters. (224, 225.)

Mr. CHAMBERS, a mine operator of Utah, says that a very large shipper ought to get a better rate than a small shipper, because the large shipper's profits may consist in the saving of freight on the material he handles. He explains, however, that he has in mind the comparison of a man who ships 1 carload a month of ore with the man or company whose shipments are large and constant, and that there is a presumption that the small ore shipper will ship a higher grade, which can stand a higher freight. The large company is likely to be mining low-grade ore, and to depend for its profit upon a large business and small expenses. Speaking generally, he would hardly advocate a discrimination between the shipper of 1 carload and the shipper of larger quantities, or at least the discrimination between train loads and carloads should be very slight. (581.)

Mr. HANAUER, formerly a smelter owner, does not know that there have been any discriminations in freight rates in recent years, though he thinks there was discrimination in years gone by. He regards it as proper that the railroads should transport low-grade ore at a low rate, barely sufficient to cover the cost of transportation, and charge higher rates on more valuable ore. The Southern Pacific guards against frauds or discriminations through this practice by requiring an assayer's certificate of the value of the ore. There should be no discrimination as to rates between a carload and larger quantities. (612.)

Mr. ALLEN, a mine manager, has not heard any complaints of freight discriminations between mines in Utah. He believes that small shippers should be able to send freight as cheaply as the largest, provided they make up a carload. (573.)

2. *Coal*.—Mr. CALLIS, county attorney of Summit County, Utah, and formerly a coal miner, believes that freight rates on coal are excessive, and that they are discriminatory against the small mine owners and in favor of the large companies. There has also been complaint about discriminations in shipping facilities. There has lately been a disposition, however, to supply the small miners with cars, and the position of the independents is therefore slightly improved. While it has been charged that the railroad companies do not encourage the developing of independent mines, Mr. Callis is not prepared to say that this charge is well founded. (630, 631.)

Mr. SHARP, superintendent of the Pleasant Valley Coal Company, states that though some stock in the Pleasant Valley Coal Company is owned by men interested in the railroad over which the coal is shipped, the company received no special freight rates nor rebates. Special rates are sometimes made to reach a certain business; for instance, to supply other railroad companies, or to get into other territories. The witness has known of rebates for some special temporary purpose, as to cover a shortage in weight or on account of inferiority in coal. (643.)

Mr. BEAMAN, of the Colorado Fuel and Iron Company, states that that company receives no rebates or discriminations, and that he does not believe that discrimination in freight rates is practiced to any extent. (266.)

Mr. THOMAS, State coal-mine inspector of Utah, says that coal which is worth \$1.50 per ton at the mine is worth \$4.50 or \$4.75 at a distance of 100 miles. The freight alone for such a distance is \$1.75 or \$2. Nearly all the coal is mined by companies affiliated with the railroads. (624.)

4. *Discriminations between places*.—Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, says that the railroads seem to favor Colorado and Missouri River points at the expense of Utah. The Hanauer smelter used to handle large

quantities of galena from Idaho. In 1885 the railroads changed their policy as to freight rates in such a way that this business was cut off. The rates for the longer haul to Colorado were so reduced relatively to the rates to Salt Lake City that, when combined with the lower rates on bullion from Colorado points to the East, they made it impossible for the Utah smelters to do the business. Though Mr. Terhune has suffered from the application of the long-haul principle, he is not prepared to say that it is in itself unjust or necessarily improper. It would, of course, be wrong for the railroads intentionally to destroy one town for the purpose of building up another, in order to make some special profit for themselves or their officers. (597, 598.)

Mr. BEAMAN does not think that coal is ever shipped over longer distances at lower rates than those for shorter distances, though the rates in many cases are the same. This is true of all commodities. Coal is doubtless cheaper in some cases at a greater distance from the mine than at a less, when there is competition at the more distant point. He does not think this is the case with Canyon City coal, which feels the effects of competition less than others. (267.)

H. Taxation of mines.—1. *Colorado.*—Mr. GRANT, ex-governor, thinks that the system of taxation of mines in Colorado is very favorable to mining. A low valuation is placed on the surface improvements and the net output is taxed at a uniform percentage under a general law. (193.)

Mr. SMITH, deputy labor commissioner, describes the method of taxation upon mining property in Colorado. He believes it would be more just to impose taxes upon mines proportionate to the royalty obtained from the mine under lease; the State should receive practically the amount over and above the cost of operation and a fair return upon the investment in the mine. Taxation, in other words, should seek to obtain the unearned increment of the mines, although it would never equal the full amount of that increment. (224.)

Mr. LEE, mine inspector, says that the Colorado mines evade the tax laws to a great extent, but attributes this to the fact that the method of taxation itself is unjust. The taxes on the gross value of ore, when the ore is of low grade, becomes unjustly heavy. Although nominally only the improvements on the surface are taxed, where the improvements are slight an assessment is practically made on the land itself. The witness favors taxation somewhat after the method employed in Mexico. (237, 238.)

Mr. BEAMAN, of the Colorado Fuel and Iron Company, considers that the fundamental defect of the taxation system of Colorado is the inequality between the counties. He believes that it would be overcome if there were county and State boards of equalization, as in some of the Eastern States. He would have township assessors, and equalization between townships by county commissioners, and equalization between counties by a State board. (266, 267.)

Mr. HANAUER, metallurgist, says that mines in Utah are taxed on a valuation, he believes, of \$5 per acre. There are taxes besides on the improvements and on the net output. He thinks the system is satisfactory. (612.)

2. *Utah.*—Mr. ALLEN, mine manager, states that in Utah mines pay a tax on land value, which is usually estimated only at the Government price, a tax on the improvements, and a tax on the net product. He considers that the tax on the net product is a discrimination against the miner. He does not suggest any better method of equalizing the taxation upon mines with the taxation upon other kinds of property, whose value, it is suggested to him, is more readily ascertainable. (572, 573.)

Mr. SHARP, superintendent of the Pleasant Valley Coal Company, says that that company's mines are taxed on a valuation of \$20 per acre, and there is an additional tax on the net product. It is perhaps a discrimination to tax the net product of mines, yet it is difficult to arrive at the taxable value of the land, and perhaps no fairer method of taxation could be devised. (640.)

3. *Idaho.*—Mr. BURBIDGE says that the rate of taxation in Shoshone County is 5 or 5½ per cent, which the mine owners consider excessive. The assessments are supposed to be at about two-thirds the value of the property. The mines themselves are not assessed, but only the improvements. The assessment of the Bunker Hill and Sullivan Company, which is capitalized at \$3,000,000, is \$250,000. (440.)

Mr. DODD, county tax assessor of Shoshone County, declares that the various mining companies in that county, but more especially the Bunker Hill and Sullivan Company, have resisted strongly the fixing of a fair valuation upon their property for the purpose of taxation. The State laws require property to be assessed at its full value. The assessors have attempted to comply with the law, and usually the property of the miners themselves is assessed at nearly full value. The witness understands that the Bunker Hill Company has declared that the property destroyed on April 29 was worth \$250,000, and yet its sworn statement as to the value of all its improvements for tax purposes in 1899 fixed the figure at only \$123,000. The wit-

ness, as assessor, attempted to collect taxes upon a larger valuation, but at the time of his testimony an injunction was pending against him to prevent him from selling the property of the company for delinquent taxes. (540, 541.)

II. LABOR IN WESTERN MINES.

A. Labor organizations.—1. *Extent of organization movement.*—Mr. COATES, president of the Federation of Labor of Colorado, says that trade unions have had a continual growth in that State during the last ten years, and are now in a better condition than ever before. The membership tends to increase during strikes. A certain proportion of those who join at such times do not understand the benefits of organization and afterwards drift out, but many become permanent members. (245.)

Mr. SMITH, deputy labor commissioner, says that the growth of trade unionism in Colorado has been irregular. At present the witness thinks that perhaps 25 per cent of the employees in all industries are members. Nearly all of the coal miners are organized, and perhaps 70 per cent of the precious-metal miners. Unskilled labor in Colorado, as elsewhere, is not so well organized as skilled labor, largely owing to its lower standard of intelligence. (211-213.)

Mr. THOMAS, State coal-mine inspector of Utah, says that there is no organization among the Utah coal miners. He regards this as due to the fact that employers and employees have no disputes. It is probable that the fact that many of the men who mine coal during the busy season, in the winter, work in the summer on their own farms, has something to do with it. Though the men have no regular union, they generally deal with their employers through representatives. (623, 627, 629.)

Mr. CALLIS attributes the absence of miners' unions in Utah to the fact that the people are disposed to conciliatory measures and the relations between employer and employee have been very friendly. (634.)

Mr. CHAMBERS, mine operator, states that he does not know of any organization of miners in Utah. There was a union at his camp, at Park City, but it never attained any prominence, and he does not think that more than one-third of the men joined it. Only one union ever attained strength enough in Utah to initiate a strike; that was at Silver Reef in southern Utah. There have been many attempts to establish unions in different camps in the State. They have failed; and he believes they have failed because the men have considered that the unions are organized by men who devote themselves to that business in the hope of getting salaries. It is his impression that this is true of unions in general. Mr. Chambers would approve of labor unions if properly conducted. (584, 586, 587.)

Mr. SHARP, mine superintendent, states that a union was formed at one of the mines of the Pleasant Valley Coal Company, and that one of its first acts was to try to secure the discharge of a foreman in a way which the heads of the organization at Denver refused to uphold. In consequence of this incident the local union disbanded. (640.)

Mr. ALLEN states that there are some labor unions in Utah, but none at his camp. (569.)

Mr. TERHUNE states that in lead smelting there is no union in Utah. He attributes this to the fact that the conditions existing without a union are satisfactory. (596.)

Mr. CALLIS, the county attorney of Summit County, Utah, and formerly a coal miner, says that while the Mormon Church does not encourage its members to join labor unions or other societies, it does not discourage them. Many of its members belong to such organizations as the Knights of Pythias and the Ancient Order of United Workmen. The attitude of the church toward all organizations is strictly neutral. The number of Mormons in the mines at Park City is exceedingly small; perhaps only 20 out of a large number employed there. (635, 636.)

2. *Western Federation of Miners.*—Mr. SULLIVAN, a metal miner of Colorado, states that the Western Federation of Miners is the organization to which the miners of Colorado most generally belong. The benefits, such as accident and death benefits, are established by the local lodges at their discretion. (347.)

Mr. CLARK, a miner, says that the Federation had about 10,000 members in 1898, and the convention of 1899 reported about 16,000. It extends into Idaho and Montana as well as Colorado. As a body it is affiliated with the Western Labor Union which was formed in May, 1899, and has its headquarters at Butte City, Mont. The Colorado local unions of the Miners' Federation are very largely affiliated with the State Federation of Labor of Colorado. (322.)

Mr. Clark states that when there is a dispute with the employers the union men and the nonunion men generally meet together, and their action is determined by the vote of a majority of all. If the vote results in a strike the nonunion men get the same support as the union men. The strikers are supported so far as possible out of the general fund of the Federation, and if it is not sufficient the members are assessed.

The action of the union is determined by referendum vote in the local branches. The witness thinks a three-fourths vote is necessary to declare a strike. Further, strikes have to be approved by the general executive board. (323.)

3. *Federation of Labor, Colorado.*—Mr. COATES, president of the Federation of Labor of Colorado, says that this State organization was formed May 1, 1896. All organized laborers in the State are eligible to membership. Unions that were represented at the first convention had about 3,000 or 4,000 members. The organization now has 15,000 or 16,000 members. As a federation it has no benefit features except that assessments may be levied in strikes by a referendum vote. Nearly all of the unions affiliated with the Federation have out-of-work benefits and funeral benefits as well as strike benefits. (244, 245.)

Mr. Coates says that the executive board of the State organization has power to levy a strike assessment not exceeding 10 cents per week for 5 weeks, and then to levy a 50-cent assessment; but upon that there must be a referendum vote. This power has been used only once. (244, 245.)

In case of a strike or a condition which threatens a strike, continues the witness, the union involved is required to give notice to the executive board of the State federation. This board is required to investigate the matter. If the strike comes, the management of it is in the hands of this executive board. A strike can only be declared by a two-thirds vote, or sometimes by a three-fourths vote, of the local unions affected. Nearly all the local unions belong to the national organization; and in case of such unions the questions pertaining to the strike are submitted to the executive board and the officers of the national organization. The details of the strike are usually placed in the hands of a strike committee of the union. The observance of law and order is one of the first principles of organized labor. Mr. Coates considers the boycott a natural and proper weapon. (245, 247, 248.)

4. *Recognition of labor unions by employers.*—Mr. BEAMAN, of the Colorado Fuel and Iron Company, does not know that the question of the recognition of the miners' unions has been mooted among that company's employees. When the committees of the miners wish to confer with the officers of the company, the company responds. He does not know whether the men are treated as organized. He believes that if a man comes with a grievance, he is received and it is talked over regardless of how he comes. No agreement in writing has been made with respect to wages. The company makes no discrimination between union and nonunion men. (263.)

Mr. Beaman states that the Colorado Fuel and Iron Company has never exacted any agreement from its men with reference to unions or union relations. Neither does the company make any deductions for insurance or make any exactions or requirements in that respect. (294.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, Colo., states that that company makes no discrimination between organized and unorganized labor, and asks no questions about it. There is only one labor union that the company has dealt with as a union. That is the masons' organization. The company has a good mason who is a member of the masons' union. When he needs men in his department, he gets them from the union, and Mr. Newhouse has found union membership to be, in this case, a guarantee of good workmanship.

The subject of the recognition of a union among the smelter men has never come up, and the witness does not know what his decision about it would be. (295, 297, 303, 305.)

Mr. HILL, of the Argo smelter, states that his company has always made it a rule not to inquire when a man was seeking work whether he was a union or a nonunion man. (373.)

Mr. ALLEN says that some mine owners in Utah would probably not object to labor unions among their men and others probably would. He does not know that there is any prejudice against the Western Federation of Miners, but some prejudice has been created against Mr. Boyce, who was at one time the head of the organization. (577, 578.)

Mr. COATES states that employers have no reason to fear that treating with organized labor would bring violence. On the contrary, he believes that the refusal to treat with organized labor brings violence. Violence is rather to be feared from unorganized than from organized labor. All the railroads make contracts with the various brotherhoods, and in Mr. Coates's experience in the last few years they have not had any friction. The Denver newspapers have had contracts with union labor for many years and have had no friction. This is the general experience. Mr. Coates has heard, to be sure, that at Wardner, Idaho, and Cripple Creek, Colo., violence was resorted to by organized labor, but he has heard that it was because of the refusal of employers to recognize organized labor. (259, 260.)

5. *General policy and character of unions.*—Mr. HANAUER, a smelter owner of Salt

Lake City, would have no objection to organizations of labor if they did not interfere with men that want to work and did not want to join the union. He does not think they have any right to dictate to employers whom they shall hire or to compel outside workmen to become members. It is just as wrong, however, for a great consolidation like the American Sugar Refining Company to put the price of its produce below cost in order to drive a competitor out of the market as it is for a labor union to say to a nonunion man that he shall not have employment. Organization of workmen is proper and perhaps necessary in itself, and he would approve a system under which the laborers on the one side and the employers on the other should treat together as organized bodies. He does not think that such a condition as this can be brought about in the West. The walking delegates are generally responsible for labor troubles. They make their living out of the unions, and they must be agitating and creating trouble in order to keep their places. (609, 617, 618.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, would favor labor unions if they would confine themselves to the principles laid down in their written constitutions. The trouble is that their actual activities are largely turned in other directions. The deliberations of the unions are generally controlled by the more radical and more active element. When they inaugurate a strike and compel men to remain out of employment who want to work, that is not in conformity with their written constitutions. Such conduct is despotism and hostile to our principles and to our form of government. There is no tyranny in America to-day equal to the tyranny of the trades unions. The denial of the individual liberty of contract is the universal practice of unionism, and necessarily so, for unionism could not otherwise exist for any length of time and perform its chief functions, namely, the maintaining and increasing of wages.

Mr. Beaman admits, however, that there is strength in union, and that it enlarges the confidence of the men in their power to bring their employer to terms. He admits also that if a man chooses to say that he will not work except for the union prices, that is all right if he wants to do it. If they do agree to abide by the principles of the union, then they should abide by them. (270, 272, 274, 286-288.)

Mr. Beaman says there are numerous instances in which conservative, level-headed labor leaders do much to settle disputes between employer and employee, and he believes that a very large majority of actual laborers who belong to unions prefer this conservative management; but the aggressive element is the noisiest and generally controls public assemblies, so that as a general rule the labor unions do not promote the best interests of the laboring men or of the country. (274.)

Mr. Beaman states that the Western Federation of Miners is even more subject than most trade unions to the fire-eating element, and has a general reputation for lawlessness. He believes that it has done more to injure the cause of labor than any organization since the days of the Molly McGuires. (274.)

Mr. SHARP says that the Pleasant Valley Coal Company would prefer not to have its men organized. (642.)

Mr. THOMAS, State coal-mine inspector of Utah, does not think that the harmony between the coal miners and the employers would be as great if the men were organized. It is not his observation that the organization of workers tends to harmony. (629.)

Mr. GRANT, of the American Smelting and Refining Company, says that the tendency of trade unions in the precious-metal mines has been toward violence and unreasonable demands. They are especially arbitrary in trying to exclude non-union men from employment. Generally speaking, Mr. Grant thinks that the organization of labor has a tendency to keep up wages and that it is necessary to prevent undue competition among the laborers. It is justifiable in the same sense that combinations of capital are justifiable. If labor organizations are reasonable, employers are willing to treat with them. (201, 203, 206-208.)

Mr. SMITH, deputy State labor commissioner of Colorado, believes that the unions in that State are generally inclined to be law abiding and orderly, as is shown by their regulations and their actions. They usually have benefit features. Only men of good moral character are supposed to be admitted, although persons of other classes sometimes get in. (211.)

Mr. CLARK, of the Western Federation of Miners, does not think that this union denies liberty of contract to the individual, whether organized or unorganized, though he admits that the union does not encourage it. The method of collective bargaining proves better in some cases than that of individual bargaining. (323.)

Mr. Clark states that the purposes of the Western Federation of Miners are to better the economic condition of its members and increase their intelligence, to protect them against sickness, and to secure a proper and healthful condition in the mines. Their means of improving economic conditions are legislation and concilia-

tion and arbitration. If conciliation and arbitration fail, there is no resource but a strike. (322.)

Mr. SULLIVAN, a metal miner of Colorado, states that some of the miners' unions have reading rooms, though others can not afford it. The men are doing more reading and a little more thinking than formerly, and he believes that all of this improvement is due to the influence of the organizations. (353.)

6. *Relation to nonunion men.*—Mr. SULLIVAN, a metal miner of Colorado, states that some nonunion men realize the benefits of organized labor. When the union has fixed a wage scale, the men who are not members take advantage of it. The Western Federation of Miners does not interfere with the liberty of men who are not members to make such contracts as they please. The cutting of wages of nonunion men affects the members of the union, but no method except moral suasion is used to prevent it. The nonunion men do not generally join the union in a strike, though some do. (347, 348.)

Mr. COATES, of the Western Federation of Miners, says that in case of a strike nonunion laborers who may be involved stop work in 99 cases out of a 100, and, when a settlement is reached, it is generally satisfactory to them. The sentiment of trades unionism largely permeates the unorganized, and many more would join the unions but for the fear of losing their positions or being blacklisted. No intimidation, coercion, or threats are used by the Federation of Labor toward nonunion men. It has never been necessary in Mr. Coates's experience to take any action toward them, except to show them the benefits of the organization. (245.)

Mr. CLARK, a member of the Western Federation of Miners, states that his organization uses its best efforts to educate the miners outside of it in a knowledge of the advantages of the union by personal persuasion and by the circulation of literature, which is sometimes found even more effective. He does not know that any other influence is used to bring men into the union. (323.)

7. *Effects on wages and conditions.*—Mr. CALLIS, county attorney of Summit County and formerly a coal miner, does not think that the maintenance of miners' wages in the East by miners' organizations has much influence upon miners' wages in the West, because wages in new countries are generally higher than in the older-settled countries. The leaders of labor organizations are generally sagacious and wise men and encourage settlement of labor disputes by peaceable means; but occasionally there are leaders who are not conscientious and who give bad counsel. On the whole, labor organizations tend to keep up the wages of the men and insure them good treatment. They also have a favorable educational influence. (635.)

Mr. SULLIVAN, a Colorado metal miner, states that the Colorado 8-hour law and the agitation which led to it were the work of the labor organizations. Organized labor is to be credited with whatever progress has been made in shortening the hours of work. (359.)

Mr. Sullivan states that the wages of metal miners in Colorado vary from \$1.50 to \$4 a day, and that the hours of labor vary from 8 to 12, according to the efficiency of their organization. (347.)

Mr. CLARK, of the Western Federation of Miners, believes that organized labor is the principal factor that maintains wages among the coal miners with whom he works. (326.)

Mr. CHAMBERS, a mine operator, states that the uniform scales of wages established in Montana, Idaho, and Colorado have been forced by the unions. He regards the principle of a uniform scale as advantageous to the men as well as to the operator. If wages are higher in Colorado than in Utah, he does not think it is because of labor organizations in Colorado. Colorado miners often apply to him for work, and if he has work for them they accept it without reluctance or demurrer. (584, 586.)

Mr. TERHUNE, a metallurgist, does not believe that the lower wages in Utah than in Colorado are due to lack of organization in Utah. It is true that organization might raise wages a little; but the rate of wages in Utah he believes to have been fixed with reference to what existing conditions enable mine owners to pay. Many silver mines have been closed down, and the men have hesitated to organize and make demands that would be hard to meet. (604.)

B. Strikes and lockouts.—1. *Strikes in Colorado.*—Mr. BEAMAN says that the labor commissioner's report for Colorado from 1881 to 1888 states that there were 53 successful and 66 unsuccessful ones among the trades in the State, not including coal mining. (293.)

Mr. LEE, commissioner of mines, discusses some of the leading recent strikes in the Colorado mines. In 1893 the great fall in the price of silver made the mine owners in Leadville reduce wages. The men refused to work at first, although the difficulty could hardly be called a strike. Finally it was agreed that wages should be reduced from \$3 to \$2.50 as long as the price of silver remained below 82½ cents. After this

many of the miners left Leadville and went to Cripple Creek to work in the gold mines. The Leadville employers, so far as they could afford it, put back the price of skilled labor to \$3 in order to keep the men, the wages of trammers remaining unchanged. It was possible to increase wages in this way only because of the general reduction in expenses, such as those for transportation and smelting, which followed the low prices of 1893.

There was next a strike at Cripple Creek for reduction of hours, which almost produced a civil war, resulting in a victory for the miners.

Another strike at Leadville was caused by a demand on the part of the men that all those employed under ground, including the trammers, should be paid the same rate of wages.

In connection with this strike, according to Mr. Lee, there had been a great deal of agitation on the part of the union leaders, with which he has very little sympathy. Just before one of the strikes at Leadville, he interviewed about 400 men and found that all but about 3 per cent favored going back to work, the men consulted being the more conservative, owners of houses, etc. These men were simply forced into the strike by intimidation. When asked how such a large proportion could be controlled by a few, Mr. Lee referred to other instances showing the strong influence of a few leaders in causing or preventing strikes. (228-231.)

Mr. SULLIVAN, a metal miner of Colorado, states that the Western Federation of Miners does not like strikes, though it is sometimes forced into one, or into a lock-out which the company calls a strike. Nonunion men do not generally act in concert with the union men, though some of them, realizing that organized labor is beneficial to them, do. (347.)

Mr. Sullivan does not think that miners are more ready to strike than men of other trades. Possibly the fact that mining is a dangerous employment may increase the differences between employer and employee. (349.)

Mr. CLARK, of the Western Federation of Miners, admits that it is often asserted that miners are more ready to strike than other workmen; but he does not believe it is true. He explains that the conditions of mining are peculiarly fitted to give rise to constant disputes between employer and employed. The character of the vein may change suddenly and repeatedly; the timbering which the miner must do is much more at some times than at others; the blast may bring down dirt with coal which it is necessary for the miner to pick out; little alterations in the screens or other appliances may be equivalent to cuts of the miners' wages. (326.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that in 1894 a strike began in northern Colorado in sympathy with an eastern strike, and the northern miners marched down through the southern district and succeeded in calling out some of the miners of the Colorado Fuel and Iron Company. The strike was purely sympathetic, and there was no dispute between the Colorado Fuel and Iron Company and its men. This company has had no general wage strikes, except two confined to the drivers. (272, 273, 293.)

2. *Strikes in Utah.*—Mr. SHARP says that there has been one strike in Utah coal mines against the Union Pacific Coal Company. It was made to resist a decrease of wages, and it was unsuccessful. There were no outbreaks of violence in connection with it. (640.)

Mr. CALLIS, county attorney for Summit County and formerly a coal miner, says that there have been two small strikes in Coalville, one about 10 years ago and one about 5 years ago. The first was caused by the discharge of an employee who disobeyed instructions. It was not successful in obtaining his reinstatement. (632, 634.)

Mr. THOMAS, state coal mine inspector of Utah, says that so far as he knows there has never been a strike in the Utah coal mines. (626.)

Mr. TERHUNE says that there has never been a strike in the smelter industry in Utah. (594.)

Mr. CHAMBERS, a metal mine operator, says that he remembers only one strike among the Utah miners. That was, he believes, a strike for union wages. There was some destruction of property, but no serious injury to persons. Some of the strikers were sent to the penitentiary for a short time. (584, 585.)

Mr. HANAUER says that he does not know of any strikes that have taken place at Utah smelters. He recalls one mine strike some years ago at Tintic. He presumes that the walking delegates of the unions brought it on. A complaint about the company boarding house was mentioned in the papers. (609.)

3. *Causes of strikes.*—Mr. CLARK, of the Western Federation of Miners, states that the chief cause of strikes in his experience is the discrimination of the corporations, in prices and methods of working, against union men. The other causes which he mentions are: An attempt to enlarge the screens, contrary to an agreement of long standing and without notice to the men; the bad ventilation of the mines; the short-

age of cars, which sometimes compels the men to quit work after being occupied for only an hour or two; and demands for advance of wages and resistance to reductions. (323, 324.)

4. *Instigation of strikes.*—Mr. LEE refers to an instance in Illinois where a few men in a mine were paid by the employers to influence the men, checking them when strikes were not desired, but instigating them to strike when the company for some reason wished to close down the works. (231.)

Mr. COATES has never known of a case in which coal companies have employed and paid men to bring about a strike. On the contrary, in almost every instance of large strikes, he knows that the leaders of organized labor have influence brought to bear upon them against the strike. Mr. Coates is confident also that no minority of a body of workmen could bring about a strike. Almost all strikes are ordered by a secret ballot, and in all organizations a two-thirds vote is required to declare a strike. Even if the ballot were open the workmen would not be influenced by a small minority of leading men. Indeed, the influence of the leaders is generally exerted against a strike. The leaders of organized labor are opposed to strikes, except in extreme cases, because they know that they will have to stand the responsibility before the community. If a strike comes, they try to have it brought to an end as soon as they can. Mr. Coates has known occasions when leaders were in favor of a settlement and where they got concessions from the owners, and yet could not get the organization to accept them. (260, 261.)

Mr. CLARK, of the Western Federation of Miners, has never known a mining company to pay any of the leaders of the men to control the miners or to inaugurate strikes. He has known of many instances in which the companies have closed down their mines without any strike or any excuse and without giving the men any notice. (337.)

5. *Sympathetic strikes.*—Mr. SULLIVAN, a metal miner of Colorado, thinks there have been no sympathetic strikes in that State among either the coal miners or the metal miners. (351.)

Mr. CLARK, of the Western Federation of Miners, states that strikes have sometimes been called at the mines of competitors who were supplying the trade while the men he was associated with were striking, but that as a general thing this measure is not necessary. (328.)

6. *Methods of strikers.*—Mr. SMITH, deputy labor commissioner of Colorado, says that the ordinary method of declaring a strike on the part of a trade union is as follows: First, the grievance is discussed generally by the organization. Then a committee is appointed to confer with the employer. Its report is discussed, and frequently several consultations by the same or different committees are held before the organization, by a majority vote, finally determines what shall be done.

Trade unions usually caution their members to abstain from acts of violence or from interfering with the rights of anyone. Sometimes committees are appointed to meet strangers coming to town and influence them not to take the places of the strikers. Boycotting was formerly practiced in Colorado to some extent, but has been declared illegal by statute. Employers have sometimes imported laborers to meet strikes, and the witness has understood that they sometimes avail themselves of a common fund. Employees themselves try to get aid from unions elsewhere. (214, 215.)

Mr. CLARK, of the Western Federation of Miners, states that while the workmen always use every method which they consider moral and fair and likely to bring about good results, they have not, in his experience, "resorted to any other influence than solid facts and reason. We propose to meet the operators on a fair basis and to show them that we know that we are right." (328.)

Mr. LEE says that most strikes have begun with formal requests and discussions with employers, but after a time they have often become violent. (231.)

Mr. SULLIVAN, a metal miner of Colorado, states that the effort of his union in case of strikes is to induce the contending forces to submit their case to a conciliatory board of some kind. Moral suasion is used to try to keep other men from taking the place of the strikers. (349.)

Mr. CLARK, of the Western Federation of Miners, states that he has known employers to hire spies to stir up dissatisfaction among the men when a strike was on. He has known them to send men from Denver "to get a keg of beer and set them up to the boys to get them to go back to work." (328.)

7. *Injunctions.*—Mr. COATES says that injunctions have sometimes been used in strikes in Colorado. During the northern coal strike in the winter of 1898 and 1899 an injunction was issued to restrain men from congregating in numbers or going on the property of the companies. Meetings were held in clear violation of the injunction, but Mr. Coates thinks no one was punished for holding them. Such a use of

injunctions tends to take away the little liberty that is left to the wage-earner and to incite the feeling among the men that they are being forced into absolute slavery. It tends to make them rebel. Mr. Coates thinks, however, that when there is reason to believe that crime will be committed men should be restrained by the courts. It is not the injunction, but the abuse of it, that he opposes. "I don't believe you can find a sentiment against the taking or restraining of a man who makes it evident that he is about to commit crime or shows a tendency in that way." (250.)

Mr. CLARK, of the Western Federation of Miners, states that an injunction was served upon him during a strike, though he was not even participating in the strike, but was engaged in prospecting. Three other men were joined with him in the injunction; he and they were the men who had defended the miners before the State board of arbitration, and he supposes that it was for this reason that they were selected. Mr. Clark considers the use of injunctions in strikes utterly unjust. "If we had tried to get an injunction to prevent the corporation from putting a blacklist upon us they would not have given it to us." (329, 330.)

Mr. BEAMAN testifies that the Colorado Fuel and Iron Company has never applied for an injunction to restrain the miners or officers from holding business meetings, nor endeavored to disperse such meetings. It has never employed detectives to find out what the workmen were doing. The only case which he recalls in which the company employed detectives was in a lawsuit with other coal companies, when detectives were hired to hunt up some witnesses. He does not know that the company's workmen have employed detectives. The company has had very little serious trouble with its men. (265.)

Mr. SMITH does not know of any particular instance where the injunction has been used in connection with strikes in Colorado. He refers to the flagrant abuse of the practice during the great railway strike in California in 1894, when several men were imprisoned for disregarding injunctions. The witness considers the practice an arbitrary and unjust extension of judicial authority. (216.)

8. *Strike against the smelters' combination.*—During the time when the subcommission was taking testimony in Denver, July, 1899, a strike was in progress among the employees of the smelters' combination, and part of the smelters in Colorado, including those at Durango, had been closed by the combination. Mr. GRANT, general manager of the smelters' combination, testified concerning the cause and nature of the difficulty. He said that the wages of men employed at the various smelters had been practically the same since 1882, except that during the great depression of 1893 a cut of 10 per cent was made. There were then thousands of men out of employment, and the smelters could easily have reduced wages from 25 to 40 per cent, but they did not do so, although the employers were not making any money. The smelters' combination had intended to increase wages on June 1, 1899, to the level which had existed in 1893. On June 15 the new 8-hour law was to go into effect. The company did not feel that it could afford to pay the same wages for an 8-hour day as had been paid for 10 and 12 hours' work. To do so would mean an increase of 33 per cent in the cost of labor. An organization was formed among the men about this time for the purpose, as the employers believed, of taking advantage of the 8-hour law and demanding the same wages as for longer hours. About June 1 the corporation posted a notice that it would obey the law and contract with its men for 8 hours of work, but would leave it optional with them to work longer hours if they desired. It was believed that many would prefer the longer hours rather than a reduction of wages. Some of the men struck against this arrangement, and the smelters were closed.

Mr. Grant thought that the demands of the workingmen were unreasonable, the wages offered, after the advance of 10 per cent, amounting to about \$1.75 per day, while men are working at the large smelters outside the combination at \$1.40 for 8 hours' work. At Omaha also wages had been advanced by the combination, and there had been no trouble with the men there. The 8-hour law was in effect in Utah, and the smelters there actually worked only 8 hours.

Mr. Grant said further that he had declined to treat with the committees of the labor organizations on the subject of this strike. It has been the tendency of organizations in the mining districts to be very arbitrary and often violent. This was true during 1894 and 1895, at Cripple Creek and Leadville especially. There had been no organization among smelters for some time until just previous to this strike. Then organizers came from various places and made unusual efforts to form unions. Violent speeches were made and men were almost forced to join. The officers of the smelters' combination knew something of the nature of this organization and feared to make concessions to it, lest it should become excessive in its demands in the future. It is possible to deal with the men in groups in a conciliatory manner without treating with their organizations. Thus 30 or 40 men have been at times sum-

moned into the office and the situation discussed freely, although the witness has found that the men were not inclined always to speak openly, especially those who belong to the union.

Mr. Grant admitted that the existence of the combination makes the employers better able to resist the demands of labor than before. Since the combination operates seven smelters in the State, it is natural that it should be inclined to shut down some of the smelters where difficulties with the men are especially serious, keeping up its production in the others, and especially in those outside of the State. Nevertheless, only about 300 or 400 tons out of the 3,500 tons formerly handled daily by the closed smelters have been diverted to other smelters. (199-211.)

Mr. COATES, of the Western Federation of Miners, believed that the smelters' strike was largely brought about by an attempt on the part of the American Smelting and Refining Company to deprive the men of the benefit of the 8-hour law. This law took effect June 16, and the strike began on that day. There was little difference as to wages. The whole question was as to the observance of the 8-hour law. The company had posted a notice which had a tendency to lead the men to believe that it intended to evade the law and its benefits by offering inducements to work longer than 8 hours. It was practically a refusal to comply with the law. Mr. Coates believed that the company was influenced by a desire to wait until the supreme court should pass upon the constitutionality of the act. If the law should be held unconstitutional, it would wish the men to return to the 10 or 12 hour basis. It did not wish to offer a better wage or to regulate conditions on the 8-hour basis, because it thought that would prevent the men from going back to the 10 or 12 hour basis if the law should be held unconstitutional. The strike did not affect the two independent companies which have smelters in Colorado. They obeyed the law. Mr. Coates did not think that there would have been any strike if the smelters' trust had not been formed. (247, 253, 254.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, stated that this organization was formed only about 7 weeks before the date of his testimony, July 15, 1899. When he testified it had a membership of 1,167. This included all but about 30 of the men employed in the two trust smelters at Denver. There had been earlier efforts to form a smeltermen's union, but they had not been successful. (306, 312, 317.)

Mr. Wright said further that the relations of the men to the smelting companies were very friendly up to the time of the strike or lockout. The majority of the men were contented with their situation, except as to the number of hours. The minority, who worked only 10 hours for smaller pay, were discontented with their wages. The cause of the strike was the insistence of the men upon an 8-hour day for all workmen, together with a larger increase in the wages per hour than the managers would grant. The occasion of the strike was the coming into effect of the Colorado 8-hour law. The witness believed that the men would have made the same demands if the law had not been passed, and that if the law should be declared unconstitutional the men would still insist upon an 8-hour day. The men had been entirely orderly during the strike. The witness did not think any man had been within 5 blocks of the smelter. (306, 309, 319, 320.)

Mr. Wright stated that the Grant smelter, which he works for, reduced the wages of its men about 10 per cent in 1893. The furnace men had received \$3 per day for 12 hours. They were cut to \$2.75. When the question of the 8-hour day came up in 1899 the company proposed to restore the old hourly rate of 25 cents, which would make \$2 for a day. The men demanded 30 cents an hour, \$2.40 for 8 hours. The common laborers, working 10 hours, had had \$1.50 at the Globe smelter and \$1.60 at the Grant. The managers wanted to reduce them to \$1.32, apparently, for an 8-hour day. The witness stated that at the time of his testimony other smelters in Denver, outside the trust, were paying \$1.60 for 8 hours to the common laborers. This was what the men demanded for them at the Grant smelter. Another class of laborers had been receiving \$2.25 for 10 hours, and the men demanded that they should receive \$2 for 8. The managers offered \$1.66½ cents. The witness does not believe that any smelter in Colorado is paying as low wages as the trust proposed to pay. The Guggenheim or Philadelphia smelter, at Pueblo, is paying \$2.30 for what the trust offers \$2 for, \$2.20 against the trust's offer of \$1.66½, and \$1.80 against the trust's offer of \$1.32.

The men based their demands partly upon the increased severity of the work and the increased output of the plants in proportion to the number of men, and partly upon the increased cost of living. Mr. Wright said no one believed that the judgment of the men was guided altogether by the rise and fall in prices of the necessities of life.

The monthly wages of the men were much less than their daily wages would seem

to indicate, because the unhealthful conditions made continuous work impossible. Working 12 hours a day, a man could not average more than 22 days a month. Even the 10-hour men could not work 26 days. (307-309, 319-321.)

Mr. Wright stated also that the American Smelting and Refining Company had refused to recognize the union. At the same time, the manager said that he would prefer to deal with four or five men rather than to try to deal with a thousand men individually. He would be willing to treat with organizations of the men if they did not take the form of unions. The manager had said he did not think it would be possible to work harmoniously with a labor union. (309, 317.)

Mr. ALLEN, a Utah mine manager, said that the smelter strike in Colorado had apparently interrupted the business of the Utah smelters. (579.)

Mr. TERHUNE, a former smelter operator, of Salt Lake City, said that some roasting ores were being brought into Utah from Colorado, but that this was not a result of the Colorado smelter strike. It was because of the scarcity of roasting ores in Utah. (601.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, said that it seemed to be admitted by the more conservative labor leaders that strikes have been damaging to labor generally. That they are disastrous to the employer is not questioned. The real loss to the community as a whole can not be statistically shown. For instance, in the then existing smelter strike, the smallest of all the losses was that to the smelter employees. The cessation of work had extended to miners, cutters and haulers of timber, coal, ore, etc., railroad employees, and in fact to almost every workman in the State, and also to the owners of the various industries affected. The loss to the owners of railroads and other industries might be to some extent made up through the mining and hauling of coal and ore hereafter, but the time lost by all of the employees was a dead, irrecoverable loss. If the smelter employees should get 10 or 12 hours' pay for 8 hours' work during 10 years to come, their extra pay would probably not equal the total pecuniary losses resulting directly and indirectly from 2 months of strike. Mr. Beaman said that he did not undertake to decide who was to blame for the strike, but only to state its economic results. (275, 288.)

C. Other evidence as to relations of employers and employees.—

1. *Coal mines, Utah.*—Mr. CALLIS, county attorney of Summit County, and formerly a coal miner, says that the relations between the mine operators and their men have been very agreeable, so far as his experience has gone. The employers consult with the men whenever any question arises, and satisfactory agreements have always been made. (632.)

Mr. SHARP states that while the men of the Pleasant Valley Coal Company are not organized, it is the custom of the company to receive representatives of the men and confer with them and reach agreements with them by conciliatory means. (641.)

2. *Colorado Fuel and Iron Company.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that the employees are not taken into consultation in regard to wages unless a complaint is made. The company fixes the price, and the miners can work for what is offered or not, as they choose. The company would not punish a man for complaining about wages or other conditions, and miners do not hesitate to make complaints. They do not make any complaint, or at least no complaint has come to the office. The company has had no serious wage strikes; none apparently, except two, which were confined to the drivers. (270, 271, 293.)

3. *Blacklisting.*—Mr. CLARK, of the Western Federation of Miners, believes that the system of blacklisting is generally practiced throughout the mines of Colorado. He knows of men who can not get work in the State unless they have friends to give them work. He knows it would be dangerous to him and his family to mention the cases by name. (328.)

Mr. COATES, of the Federation of Labor of Colorado, says that there is a law against blacklisting in Colorado, but that it has no effect. Wage earners are blacklisted from one end of the State to the other. In the existing smelters' strike, men have been threatened with discharge, even by persons who have but a remote interest in the matter, because of their position in regard to organized labor. (248.)

Mr. SULLIVAN, a metal miner of Colorado, states that after a labor dispute at Aspen, which he was familiar with, those who had been active on the side of the men were unable to get work. The manager of one of the mines was afterwards arrested for keeping a blacklist. The most of the men in question have been obliged to leave the region. The witness thinks that blacklisting should be made a felony. (349, 356.)

Mr. HAMMOND, secretary of state of Utah, says that that State has a constitutional provision against blacklisting. There was probably some blacklisting in the State during the railroad troubles in the nineties, but it was not very extensive. (622.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, declares that he knows of no blacklists among employers in Colorado. (293.)

4. *Association of employers.*—Mr. COATES has no objection to associations of employers parallel with the associations of laborers. Organized labor would prefer to settle the entire conditions in a trade in one negotiation with an organized body. Organized action brings about the same conditions and it removes friction. (257.)

D. Amount and regularity of employment.—1. *Employment in Colorado.*—According to Mr. SMITH, although there has been a large absolute increase in the number of men employed in Colorado during the past 20 years, the proportion of those employed to the total number is much less. The witness thinks that probably, on the average, 25 per cent of the workmen are out of employment at all times. The chief cause of irregularity of employment, he thinks, is that the wages which workmen receive do not enable them to buy back more than a small portion of their total product. (219, 220.)

Mr. LEE, mine inspector, believes that the unemployed in Colorado are mostly confined to the larger towns. There are few in the mining camps. A good deal of mining labor is done by men who own their claims, some of whom work only on account of their assessments. In 1898, and up to the time of the strikes caused by the 8-hour law in 1899, there were more men employed than ever before. The witness admits that some men fail to find employment, but attributes it to their own lack of real desire to work. In applying for work men often speak in an indifferent manner. This may, to be sure, be occasionally due to ignorance of the proper method of addressing an employer, but often men apply for work merely to make a showing. (234, 235.)

Mr. SULLIVAN, a metal miner of Colorado, says that improved machinery and the concentration of industries are the causes of irregular employment. His remedies are competition by the Government in manufacture and distribution and the shortening of hours. The Government should build a railroad, for instance, parallel with every privately owned road.

Mr. Sullivan states that he worked about 250 days during 1898, and that this is probably a larger average than the most of the miners in his line have been able to make during the last 5 or 6 years. (354.)

Mr. COATES considers that the tendency to combination and the closing of plants for economy in production and the employment of children are among the causes of the irregularity of employment. (253.)

2. *Employment in Utah.*—Mr. CHAMBERS, a metal mine manager, states that the number of men employed in the metal mines of Utah has not greatly varied during the last 10 years. Machinery has diminished the number of men in particular mines, but new mines have been opened which have taken them in. There was a lack of employment for several years before the present, but there is now a better demand for miners than has existed for 5 or 6 years past. (580, 581.)

Mr. THOMAS, coal-mine inspector of Utah, says that the number engaged in coal mining in that State has steadily increased. (623.)

Mr. ALLEN states that the Centennial-Eureka Mine, near Salt Lake City, has men who have worked in it steadily for 10 years, and one man who has worked there for 12 years. (577.)

3. *Employment in Idaho.*—Mr. BURBIDGE says that the Idaho mine owners wish to keep their mines in continuous operation. The organization of a large mining force is difficult and expensive, and it is better to operate for a time at a loss than to permit the crew to become disorganized. (440, 441.)

E. Rates of wages. Earnings.—1. *Wages in Colorado generally.*—Mr. SMITH, deputy labor commissioner, testifies that the wages in the precious-metal mines of Colorado are usually from \$2.50 to \$3 per day, although occasionally as much as \$3.50 is paid, especially where the mines are wet and unhealthy. Coal miners usually work by the ton. Recently they have often not been able to work more than 5 or 6 days in the month, so that their wages have been as low as \$20 per month, but when working steadily they often make as much as \$80 or \$90. The witness believes that wages generally throughout Colorado are higher than in other States, though they have fallen as compared with the early days when the country was new. Wages are somewhat higher in the mountain regions than in the valleys. The wages of miners greatly affect those of all other occupations. Thus farm labor commands higher wages in the vicinity of mines, especially of the mountain mines. The workmen have become more intelligent during the past 20 years and spend their wages more judiciously than before. (216, 219, 223.)

2. *Wages in metal mining, Colorado.*—Mr. SULLIVAN, a metal miner of Colorado, states that in the 20 years of his employment he has received as much as \$7 per day and

as little as \$3; not for the same class of work. Men in metal mines work by the day, and their wages vary in different districts from \$1.50 to \$4 per day. The variation depends chiefly on the organization of labor. Wages have rather decreased during the last 20 years. Measured by purchasing power, wages are not much lower than 20 years ago, but possibly a little lower. The witness does not believe that workingmen dress better or have more luxuries than 20 years ago. He adds that the wages of the coal miners have greatly decreased. (347, 353, 362.)

Mr. LEE, mine inspector, says the average pay for trammers and lower-grade laborers in the precious-metal mines of Colorado is \$2.50, while in most of the large mines the regular miners get \$3 per day, although there are some differences in different places. In 1880 wages were more, usually \$3 per day besides board, board not being included in present wages. At the same time the purchasing power of money is much greater than in 1880. (233, 234.)

Mr. COATES, a miner, says that in the isolated mining camps of Colorado wages are better than in cities. This is largely due to the higher cost of living, where men are separated from the benefits of large communities. Rents are higher, food is higher, transportation is higher, and wages must be higher. (252.)

Mr. Coates says that there has been very little change in wages in Colorado during the last 10 or 20 years. Organization has been fairly thorough in mining, the chief industry of the State, and that has had a tendency to keep wages from falling. (252.)

3. *Wages in coal mining, Colorado.*—Mr. CLARK, of the Western Federation of Miners, states that he kept the weights for a year, about 1897, at the best mine in his district of Colorado. In that year the average earnings of the men for the days that they worked were \$2.30 per day, and their average working days were 11½ per month. This would give a gross income of some \$27 per month. From this must be deducted at least \$5 per month for necessary expenses. These expenses include powder, 1 keg, \$2.50; tax for doctor, \$1; oil, 60 cents; payment to check weighman, 50 to 60 cents; blacksmithing, 50 cents. (336.)

Mr. Clark states that in his part of northern Colorado the price per ton for mining coal with a pick, on the basis of screened coal, has been reduced from 92½ cents to 80 cents per ton since 1888. At the same time changes have been made in the screens, which he considers to have reduced the miners' earnings by from 3 to 5 per cent. Besides, the veins that were worked 10 years ago were distinctly better, as regards thickness of coal and natural opportunities for working it, than those that are mined now. The methods of mining by pick work are about the same now as then. (331-333.)

Mr. BEAMAN, of the Colorado Fuel and Iron Company, testifies that nearly all coal miners are paid by the ton. A few, in mines where the coal has to lie for some time, are paid by the cubic yard. The price paid varies at different mines, according to the character of the vein and the ease with which it is mined. The tonnage rates were fixed many years ago and there has been no general change within the witness's knowledge. No doubt miners' wages must have been fixed with some reference to what could be earned in other occupations. There was no change in 1893 or 1894 by reason of the panic. (261, 262, 264.)

Mr. Beaman says there is no general demand for higher wages among the miners. Wages are the same that they have been for years, and industrious and skillful miners earn from \$4 to \$5.50 per day. Hundreds of the Colorado Fuel and Iron Company's miners earn over \$100 per month net—that is, after all deductions for powder, oil, and the like. The Colorado Fuel and Iron Company pays \$2.60 to its day laborers about the outside of the mines, while in Kansas the same class of labor gets \$2. The lowest wage paid to day workers in the mines is \$1.50 and the highest \$3.25. At the steel works wages run from \$1.40 to \$5.28. (285, 293.)

Irregularity of work.—Mr. BEAMAN testifies that his company mines so many qualities of coal that one mine may have a rushing demand and another may be out of orders, and the idle mine can not fill the orders that are on hand because it has not the right kind of coal. No artificial causes, such as the 8-hour law or any labor legislation, have recently closed any of his company's mines. The smelters' strike has diminished the demand for coal. The Colorado Fuel and Iron Company supplies the trust smelters with a considerable amount of coal and coke, and probably furnishes most of the coal used in the Denver mines. The mining business, on the whole, is fairly prosperous; as prosperous as at any time since the panic. (267, 268.)

4. *Wages in metal mining, Utah.*—Mr. ALLEN, manager of the Centennial-Eureka mine, Salt Lake City, states that the prevailing rate for mining in Utah was formerly \$3 per day and is now \$2.50. Some mines still pay \$3 and others \$2.75. Shaft work and special work cost more. In wet mines the wages may often be higher, but \$2.50 may be considered the scale of wages of the State. Mr. Allen believes that the condition of the laborers is at least as good as in any former time, if not better. (568, 569.)

Mr. Allen suggests, in explanation of the fact that wages for underground work are generally \$3 in Butte, Mont., \$3.50 in Idaho, and \$2.50 in Utah, that both clothing and living are cheaper in many cases for the Utah miner. The Utah mines are generally dry, and the avoidance of the use of rubber clothing saves a considerable expense. Another cause is that many of the miners have small farms in the valley, and their families live there and work the farms; or the farms are rented and add in that way to the owners' incomes. Mr. Allen thinks that the men could save as much at Eureka on \$2.50 per day as in Leadville or Cripple Creek at \$3 per day. (570, 576, 577.)

Mr. HANAUER, smelter operator, thinks that metal miners in Utah get from \$2 to \$3.50 per day, according to the kind of work they are upon. He thinks there has been no great change since 10 or 12 years ago, though there may have been some decrease. Expenses of living have decreased within that time, and a man can save more money now than he could have saved a dozen years ago. At Bingham wages as low as \$2 are paid. Mr. Hanauer does not think they run lower than \$2.50 at any other camp. The low wages at Bingham are caused by the low quality of the ore; the mines could not run at higher wages. In Custer County, Idaho, according to Mr. Hanauer's experience, miners and outside laborers get \$3 and men working on the drills \$3.50. Mechanics get from \$4 to \$4.50 a day. The expense of living there is estimated by the witness at 33 per cent greater than that in Utah. Rubber suits are not needed, however, except by men who are sinking shafts. (607, 608.)

Mr. CHAMBERS, mine operator, states that the wages of miners for the 8-hour day in Utah are \$2.50 in some districts, in others \$2.75 and \$3. In his own mine there are miners getting all these rates of pay, according to their skill and the character of their work. Mr. Chambers pays men engaged in sinking shafts \$3.50 a day; it is wet ground and more dangerous, and it is really harder work. "It takes a good lusty man to make any motion in a shaft." He thinks the system of paying men according to their value is every way better than the system of a uniform scale. It is an incentive to the men to make themselves efficient. (584.)

Mr. Chambers thinks that a man can save as much on \$2.50 per day at his mine, Park City, Utah, as on \$3 or \$3.50 per day in Montana or Cripple Creek or Leadville. Living is much cheaper. Farm products are cheaper. A very important difference is that in Butte, for instance, the mines are wet and the men have to wear gum boots, coats, and hats. The miners always contended that the gum suit costs 50 cents a day, though Mr. Chambers thinks this is rather overestimated. (585, 586.)

Mr. Chambers says also that some differences in wages, particularly the uniform scales for surface mining and underground mining in Montana and the Coeur d'Alene, result from the operations of the unions. (584.)

This witness says further that even in mines close together there may be great differences in the ability of the operators to pay high wages. One mine may work at a profit at wages which would compel its neighbor to close down. (586, 587.)

Sliding scale.—Mr. CHAMBERS states that when silver went down to about 60 cents per ounce, and many mines were compelled to close down, some mines in Colorado cut the wages and continued to work, promising that when silver went to such and such a price the wages should be advanced. He knows of no nearer approach to the sliding scale system in the mines. He regards the idea of a sliding scale as just and desirable, saving the owner from the need of stopping his work, and giving the laborer employment. (581, 582.)

Mr. ALLEN says that the sliding-wage scale is not resorted to in Utah, so far as he knows. When the general reduction of wages from \$3 to \$2.50 took place, some mines promised that if the value of silver was restored wages should be restored. He has not seen any closer application of the sliding-scale principle. (570.)

5. *Wages in coal mining, Utah.*—Mr. THOMAS, State coal mine inspector of Utah, says that miners in that State get 35 to 45 cents a ton for run-of-mine coal, and 60 to 80 cents a ton for screened coal. When coal is screened about one-third of it goes into the slack. The average wages for 1898 were \$2.65 for 8 hours' work, after deducting powder and other expenses. The average number of days worked is not given. Drivers get \$2.50 per day; the same for the 8-hour day which they used to get for 10 hours. The outside men get 20 cents an hour. They used to get 20 cents an hour when they worked 10 hours per day, so that their daily wages are diminished. (624, 626, 628, 629.)

Mr. SHARP, of the Pleasant Valley Coal Company, says that the average earnings of its miners are about \$2.50 per day. An exact statement of the earnings for February, 1899, shows an average of \$2.65 for 8 hours' work, after making the deductions for powder, oil, fuse, blacksmithing, and doctor. Thirteen miners average \$3.25; the next highest 20, \$3.08; the next highest 30, \$2.94; the next highest 45, \$2.62; the next highest 45, \$2.59. Drivers receive \$2.50 per day, and outside men 20 cents an

hour. Twenty cents an hour is rather more than ordinary wages for common labor throughout Utah. (639.)

Mr. Sharp says also that the miners average 24 or 25 days per month for 8 or 9 months in the year. During the summer the consumption falls off so that, though many of them, perhaps 25 or 30 per cent, work upon the farms, the remainder can put in only 3 or 4 days per week. (638, 639, 643.)

Mr. CALLIS, county attorney of Summit County, Utah, and formerly a coal miner, says that wages are not so large as they were 20 years ago or 10 years ago, because of the fierce competition. A greater tonnage can be made, because of improved tools, etc., but the rate paid per ton is not so great. The cost of living also has decreased, but not as much as wages. (630, 636, 637.)

Mr. Callis thinks that the condition of the coal miners in Utah is better than in the Eastern States, but perhaps not so good as in Wyoming. (630, 633, 637.)

Mr. SHARP thinks that the wages of miners have perhaps fallen 10 or 12 per cent in 15 years, and that the cost of living has fallen quite as much. (643.)

Mr. THOMAS, State coal mine inspector of Utah, says that the wages of miners there are perhaps a little lower than 10 years ago. The necessities of life are also cheaper, and Mr. Thomas thinks that as great a saving could be made from the miners' wages now as then. (623.)

6. *Wages of smelters* (see also as to strike of 1899, p. LVIII).—Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, Colo., states that men who formerly received \$2.25 per day for 12 hours are now receiving \$2 per day for 8 hours; men who received \$2 per day for 12 hours, now receive \$1.80 for 8 hours. The change was made on June 15, 1899, when the Colorado 8-hour law went into effect. (301, 302.)

Mr. Newhouse states also that the wages paid under him are now higher than ever before. This statement apparently refers to wages per hour, the working-day being now shorter than formerly. The witness does not believe that the average employee could buy more with a dollar now than he could buy in 1890, and he can not buy as much now as he could buy 2 years ago. (296.)

Mr. HILL, of the Argo smelter, Denver, states that before the 8-hour law went into effect that smelter had no men who got less than \$1.75 per day, and that the wages in different departments ran up as high as \$4.50. Not many men got so much as that, but there were a great many who got over \$3 per day. When the 8-hour law went into effect that company made a temporary arrangement with the men, pending the decision of the constitutionality of the law, to run with 8-hour shifts at substantially the same rate per hour which had previously been paid. In a few cases the rate per hour was slightly increased. (371, 372, 381.)

Mr. Hill states that when he first built a smelting plant at Blackhawk, Colo., more than 20 years ago, wages were fully double what they are now in Denver. This was largely due to the situation of the plant up in the mountains, and to the lack of railroads, which made it necessary to haul supplies in wagons from the Missouri River. The cost of living was necessarily very high. Wages gradually went down with the coming of railroads. When the witness's plant at Argo was built 21 years ago a scale of wages was adopted which is practically the same as that which prevailed up to the passage of the 8-hour law in 1899. Common labor is even now more expensive in the mountain towns than in the valleys, for instance in Denver. (370, 378, 379.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, says that wages in the smelting industry were greater 20 years ago than now. Expenses of living were also higher. At the Hanauer smelter wages were reduced 10 per cent on January 1, 1894, and there was a further reduction of wages per day when the 8-hour law took effect on June 1, 1896. The men are able to work so much more steadily under the 8-hour system, however, that the monthly earnings are nearly as much as before the change of hours. Mr. Terhune submits the following table of wages at his works: (590, 591.)

Rates of wages, Hanauer Smelting Works, Utah.

Occupation.	Before 10 per cent reduction of Jan. 1, 1894.	After 10 per cent reduction of Jan. 1, 1894.	Under 8-hour law, June 1, 1896.
Crushermen	\$3 per 12 hours....	\$2.70 per 12 hours.	\$2.40 per 8 hours.
Roast firemen	\$2.50 per 12 hours.	\$2.25 per 12 hours.	\$1.66 per 8 hours.
Roast helpers	\$2.25 per 12 hours.	\$2.25 per 12 hours.	\$1.50 per 8 hours.
Blast furnace feeders.....	\$3 per 12 hours....	\$2.70 per 12 hours.	\$2 per 8 hours.
Furnacemen	\$3 per 12 hours....	\$2.70 per 12 hours.	\$2 per 8 hours.
Furnace helpers.....	\$2.25 per 12 hours.	\$2.25 per 12 hours.	\$1.50 per 8 hours.
Laborers	\$1.75 per 10 hours.	\$1.575 per 10 hours	\$1.40 per 8 hours.
Suppliers	\$2.25 per 12 hours.	\$2.025 per 12 hours.	\$1.50 per 8 hours.
Teamsters	\$2.25 per 10 hours.	\$2.25 per 10 hours.	\$2.25 per 10 hours.
Night foreman	\$4.50 per 12 hours.	\$4.05 per 12 hours.	\$3.25 per 8 hours.
Day foreman	\$1.60 per month ..	\$1.44 per month ..	\$1.44 per month.
Blacksmith	\$4.25 per 10 hours.	\$4 per 10 hours....	\$4 per 10 hours.
Blacksmith helper	\$2.25 per 10 hours.	\$2.25 per 10 hours.	\$1.75 per 10 hours.
Dump foreman	\$2.50 per 10 hours.	\$2.25 per 10 hours.	\$2.25 per 10 hours.

F. Payment of wages. Screening of coal, etc.—1. *Intervals of wage payment.*—In the precious-metal mines of Colorado, according to Mr. LEE, mine inspector, the more common time of payment is by the month. In some places the mines are practically carried on for 25 days on the capital of the employees. The witness believes in cash payment. (232.)

Mr. ALLEN, mine operator, states that the custom in Utah is to pay once a month. He has never heard any complaint from the men on this ground. (569, 570.)

Mr. SHARP states that the Pleasant Valley Mining Company (Utah) pays wages monthly; for each month about the 20th of the following month. (643.)

Mr. TERHUNE, metallurgist, says that wages are ordinarily paid once in 30 days in the Utah smelters. He does not think it necessary to pay oftener, especially where men who need them can get advance orders for goods before pay day. (594.)

Mr. BURBIDGE, mine operator, says that the usual method of payment in the Coeur d'Alene district is by the month, the wages of the preceding month being paid from the 10th to the 20th of each month. It takes some time to make up a pay roll, which accounts for this delay in payment. (460.)

Mr. COATES, of the Federation of Labor of Colorado, considers that a month is too long an interval between payments of wages. Where monthly payments are used, it is usually 5 or 6 weeks before the employee actually gets the pay for his work. This puts him at the mercy not only of the company store but also of individual merchants, who charge an increased price for their goods for fear of loss, and also for the length of credit. (250, 251.)

Mr. SMITH, deputy commissioner of labor, Colorado, thinks that frequent payment of wages is very advantageous to workmen in enabling them to buy for cash, which is more economical. (216.)

Mr. SULLIVAN, a metal miner of Colorado, thinks that the oftener men are paid the better off they are. Wages should be paid once a week. (352.)

Mr. CLARK, of the Western Federation of Miners, holds that wages ought to be paid either weekly or semimonthly. (330.)

Mr. CALLIS, county attorney of Summit County, Utah, and formerly a coal miner, thinks that the position of the coal miners would be improved if wages were paid twice a month instead of once a month. The long interval between the payments compels the men to buy on credit; and a man can never do so well on credit as with cash. The change would perhaps cause some little embarrassment to the employers, but could be so arranged as to be no great hardship. (633.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, believes that weekly and bimonthly payment laws will affect nearly every industry injuriously. Almost all of the business of the country is done on 30 days' time as equivalent to cash. The employers generally pay their laborers every 30 days, and in turn sell the products at 30 days, and so the round of business goes on. To break one link of the system by shortening the time of payment would be a hardship to one party and would be a doubtful benefit, to say the least, to the other. The doubling of the actual work of making out the pay rolls and of preparing checks would involve a large increase of expense to the employer. The coal mines shut down to pay the men. Pay day means 1 or 2 or 3 days of idleness and often of dissipation. To double these pay days means to double the idleness and dissipation, double the money wasted at the saloon, double the loss of time to the mine or other industry from enforced idleness, double the loss of time to the sober miner, who can not work because the mine

stands idle. The chief objection to the semimonthly pay day in Colorado is the increased capital required to run the business. Many employers who find much difficulty in meeting monthly pay rolls would be utterly unable to meet them semimonthly. (275, 276, 289.)

2. *Weighing and screening of coal, Colorado.*—Mr. CLARK, of the Western Federation of Miners, states that from 1888 to 1893 in the Louisville and Lafayette districts of northern Colorado coal was screened on a screen 12 feet long, $4\frac{1}{2}$ feet wide, with flat bars an inch and a quarter apart. The screen is now 14 feet long, $5\frac{1}{2}$ feet wide, and has a diamond bar. He thinks that the change of the screen reduces the miners' wages by from 3 to 5 per cent.

Mr. Clark states that in his part of Colorado the proportion of coal which goes through the screens is estimated from $33\frac{1}{3}$ to 40 per cent. In reply to a question as to a statement before the Commission that in other parts of the State some 50 per cent passed through the screen, the witness says that may be so, as he believes that screens with a 3-inch mesh are used, at least in some places in the southern part of the State, while in his region the mesh is $1\frac{1}{2}$ inches. The price of mining on the run-of-mine basis is proportioned to that of mining on the basis of screened coal, according to the amount of coal which passes through the screens. For instance, where screened coal is paid for at 80 cents per ton, and $33\frac{1}{3}$ per cent runs through the screen, wages on the run-of-mine basis are $53\frac{1}{3}$ cents per ton. In spite of this Mr. Clark insists that the miner who is paid on the basis of screened coal does not get pay for mining the nut and slack. His idea is that the companies make three grades of coal—lump, nut and pea, and slack—but that they base the miners' tonnage on only two grades—the lump and the slack. (330, 331.)

Mr. Clark states further that an antiscreen law was passed 2 years ago by the Colorado house of representatives, and had been read twice in the senate, when it was stolen, as Mr. Clark believes, at the instigation of the corporations. (334.)

Mr. BEAMAN, of the Colorado Fuel and Iron Company, does not know the size of the screens which his company uses nor the size of the bars nor the space between the bars. About 40 or 50 per cent of the whole product passes through the screens. He does not think the men's wages would depend altogether upon the amount paid for screened coal. His company screens the coal from some mines and not from others. He does not call to mind any instance where screened and unscreened coal are sold from the same mine, though this is sometimes done. For this reason, and because the company mines so many different qualities of coal, it is impossible to make a comparison between the price of screened coal and that of unscreened. The price of all the company's different qualities of coal varies between \$1 and \$1.50 per ton. The screenings are used for making coke. The wages of the men are doubtless adjusted so that they can make about the same whether the coal they mine is screened or not. (264, 292, 293.)

Mr. Beaman states further that at the mines where domestic coal is produced each pit car as it comes from the mine is dumped over a screen chute, through which the slack, dirt, etc., falls, while the lump coal passes on to the railroad car at the foot of the chute. The weight of this lump coal is then taken by track scales, and on it the miner's pay is based. In all mines producing domestic coal the object is to get as large a percentage of lump coal as possible. There is no market for slack. At many mines the slack is made into coke, but at some it is absolute waste. An unskillful or careless miner will make double the amount of fine or slack coal that a skillful and careful one will. This is an injury to the operator and to the country also, since it destroys a valuable asset. The system of payment according to the amount of lump coal delivered places a premium on skill and care. The idea that the miner ought to be paid on the basis of all the coal he mines has only a sentimental validity. He is paid for all the coal he mines whatever the basis of payment may be. If he is paid for lump coal only, the rate per ton is necessarily made high enough to enable him to earn as much per day as is earned in other mines where the payment is based on the whole weight brought out. Where coal is sold by the "run of mine"—that is, just as it comes from the mine—the miner is paid in the same way. But it makes no difference what method is used. To insist upon payment on the basis of all coal mined, including slack, is much like insisting that a cabinetmaker working by the piece should be paid in proportion to the amount of the material he uses, or to the sum of his finished work and the chips he makes. Coal miners do not hesitate to demand any change of method which the majority of them desire. No application has ever been made for a change to the system of "weighing on top" or weighing all coal mined as a basis of payment. "A great majority of miners are not only content with the present method of weighing, but opposed to any other as unfair to the skilled workman."

There are other reasons for opposing the change. It is usually difficult to pass the

coal into railroad cars as fast as it is delivered from the mine. Where the coal is weighed on the railroad cars no time is lost, as the weight is taken while the pit car is being run back and another run forward. If the pit car had to be stopped and weighed before being dumped, the capacity of the mine would be diminished quite 25 per cent. Every additional expense imposed on Colorado coal production restricts the boundaries in which it can be sold and so decreases the demand. The Wyoming legislature passed a "top-weighing law" a few years ago, but by the general petition of the miners it was finally disregarded and remained a dead letter. In Illinois the legislature undertook to compel the mine operators to weigh their coal on track scales, on the system which it is now proposed to forbid in Colorado.¹ This indicates the folly of the whole agitation. The Illinois law was pronounced unconstitutional when a man who used no scales was indicted under it. (283-285.)

3. *Screening of coal, Utah.*—Mr. THOMAS, State coal mine inspector of Utah, states that Utah has no law regulating the screening of coal. The most of the coal mined in Utah is screened. About one-third of the coal goes through the screens as slack. Where the coal is sold "run of mine," the miners are paid on the same basis and receive from 35 to 45 cents per ton. Where it is sold screened, the miners receive from 60 to 80 cents a ton for screened coal. (624, 628, 629.)

Mr. HAMMOND states that there is no law regulating screens in coal mines in Utah. (620.)

Mr. CALLIS, county attorney of Summit County, Utah, and formerly a coal miner, states that he succeeded two years before, when a member of the legislature, in getting a law passed for the compulsory weighing of coal. Many mines in Utah had weighed their coal voluntarily; but he believes the law has given great satisfaction. (632.)

Mr. SHARP, of the Pleasant Valley Coal Company, states that his company made a test some years ago and learned the average amount taken out by the screen. It now weighs its coal before screening and deducts the ascertained average percentage. (641.)

4. *Fines, docking of wages.*—In Colorado, according to Mr. SMITH, deputy labor commissioner, coal miners are frequently fined by deduction from their wages for loading coal containing rock and waste material. The deductions are considered excessive. Differences have also arisen between employers and employees as to whether coal should be handled with shovels, or forked. (218.)

Mr. COATES, of the Federation of Labor of Colorado, says that there is very little fining of workmen in Colorado, or imposing penalties upon them, for imperfect work or for destroying an article while making it, though there may be some such instances. (252.)

Mr. BEAMAN thinks that the Colorado Fuel and Iron Company has no system of docking miners for impurities in their coal. The coal of Colorado is perhaps a little cleaner than that in some of the Eastern States and there is less trouble from impurities. (263.)

Mr. THOMAS, State coal mine inspector of Utah, says that each coal mining company has rules regarding cleanness of coal, but these rules do not usually involve a system of fines. A man is notified the first time he sends up coal with slate in it, and the second time he is discharged. (624.)

5. *Time and piece wages.*—Mr. ALLEN, mine operator, states that the general custom in the metal mines of Utah is to pay the men by the day. In prospecting, the work is often done by contract, but he knows of no mine that is being run, after mineral is discovered, by contract. (570.)

In making drifts and slopes, says Mr. LEE, mine inspector, Colorado, payment is largely by the foot or fathom. In some of the mines the ore is paid for by measurement, but day wages are more common. Overtime is usually paid for at $1\frac{1}{2}$ rates. (232.)

Mr. SMITH says that the more common method of fixing wages in the metalliferous mines of Colorado is by the day, although the driving of tunnels and drifts is frequently done by the foot. Coal miners are paid usually by the ton. (217.)

6. *Failure to pay wages.*—Mr. SULLIVAN, a metal miner of Colorado, states that he earned \$96 in a mine operated by a receiver, in 1896, and has received only about half the amount. It does not seem to be possible to collect the amount by law. The mine is paying dividends at the present time. The witness thinks that men who work in mines and fail to get their pay should have the right to take and hold the property. It appears that in the case in question the receiver held only a lessee's interest, and that the lease has since expired. (352, 356, 360.)

¹ For different testimony as to the nature of the Illinois law, see *Screens*, under *Coal mining in the Eastern and Central States*, p. cxx.

G. Company stores, tenements, boarding houses, and hospitals.—

1. *Company stores, store orders, etc., Colorado.*—Mr. COATES, of the Federation of Labor of Colorado, says that a good deal of scrip is used in Colorado—store orders and the like—especially by the Colorado Fuel and Iron Company. This company uses the store system at nearly all of its Colorado mines. A few independent companies had used it up to the passage of the recent law against it, but Mr. Coates thinks that the independent companies are now dispensing with it. The only instance that he knows of where the company store is used, except in connection with mines, is at the steel works of the Colorado Fuel and Iron Company at Pueblo. The system compels the wage earner to trade at the company store, and he is charged the highest kind of a price. The companies try to make the men believe that they use their own volition, but everyone knows of his own experience that this is not true. The company store is detrimental to the workers and also to general business interests. It tends to make competing employers reduce wages, because they do not get the advantage of the profits that the companies which own stores get. (250, 251.)

Mr. CLARK, of the Western Federation of Miners, states that there are company stores owned by the coal-mining companies in his part of Colorado, and that he does not approve of them. One company proposed to establish a store at Louisville; the men notified the company that they would not deal at such a store, and the plan was abandoned. Where such stores exist, however, the men are not compelled to trade there. (332, 333.)

Mr. Clark says further that the coal companies charge the miners \$2.50 per keg for powder which costs them about \$1.25 or \$1.30. In some places the miner must buy the powder of the company, and in other places he can buy it where he likes. He has known of instances where men insisted on the right to buy it where they pleased, and were not punished for it. He does not think a company would venture to punish a man for this, because the man would be backed by the union. At one time the witness's union itself bought powder and sold it to the men. This has been given up. (336, 337.)

Mr. Clark states that though there is a law in Colorado forbidding truck stores, it is not enforced. There are company stores at some of the metal mines, but the men object to patronizing them or to "being held up by them." The witness has worked at mines where the companies kept stores, but has never worked where store orders were used in payment of wages. (348, 352, 353.)

Mr. SMITH, deputy labor commissioner, implies that company stores in Colorado are chiefly found in connection with the coal mines. He believes that they compel the employees to pay much more for the necessities of life than would otherwise be the case. Although usually there is no absolute order that men must deal at the company store, those who do not are discriminated against in various ways. Company stores also sometimes give those who own them an advantage in competition with other producers. (217, 218.)

Mr. GRANT says that there are practically no company stores in connection with the precious metal mines in Colorado, although the last State legislature passed a law regarding them. The Colorado Fuel and Iron Company has some stores in connection with its coal mines. (193.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, declares that this company has never paid its employees their wages or any part thereof in scrip. The Colorado Supply Company, a subsidiary organization, operates stores at some of its mines, and at other mines arrangements are made with responsible merchants, who receive the company's orders and pay the company a commission of 5 per cent upon them. The system formerly was that the miner who desired any advance on his wages applied at the mine office and received an order on the company store for such sum as he desired. At the store he bought such goods as he needed and received the balance of the order in scrip, which was available for further purchases. In consequence of the company-store law the company no longer issues orders, but the miner draws his own order, which the law does not prohibit. All bookkeeping is dispensed with, and all chance of dissatisfaction over accounts. The system is satisfactory to all concerned, except to those who have some ulterior purpose to subserve, "and to a few jealous merchants who do not happen to keep the stores, and saloon keepers who would like to have more frequent opportunities to get some of the miners' wages. It benefits the miner and his family as much as it does the employer. It is to his advantage to be able to thus obtain advances on his pay for his needs before pay day arrives. No employee is ever required to take them."

At mines where there are no company stores garnishment of wages by merchants and saloon keepers with whom the miners have traded on credit are numerous, and a source of much unnecessary expense to the miner.

The demand for the company-store law has come chiefly from some merchants of Trinidad, who, "not being satisfied with the trade they naturally get, desire legislative assistance in forcing trade their way and out of its natural channels." These merchants, and other employers generally, undoubtedly expect their employees to buy from them such goods which they deal in as the employees need. The law has no doubt been violated every day since its passage by nearly every farmer, business man, and merchant in the State, and will be as long as it disgraces the statute book. The laborer can not be expected to respect a law which forbids his employer to furnish him with any necessary of life unless he pays for it in cash, no matter how much may be coming to him as wages. The use and abuse of scrip and company stores in Colorado have never been investigated in any court or by any legislative committee. The charges have been reiterated by the pretended friends of labor till the legislature and many uninformed people have assumed, contrary to the facts, that scrip and company stores are means of oppression. One of the grievances of the rival merchants is that country people trade with company stores because of the variety of the stock. The goods are sold to them at the same prices as to the miners. The company stores are able to pay the company a 5 per cent commission and still sell as low as others, because the whole system of stores, 10 or 12, buy goods in very large quantities in the great centers. Several of the company stores sell at wholesale to neighboring merchants in the same town. At one mine, at Crested Butte, the miners claimed that they were often charged excessive prices by the merchants, and at their request the company started a store. There has never been any demand from any considerable number of men for a cessation of the system, though a few individuals have objected to it.

No coercion is exercised upon the employees. Indeed, there is a prohibition against coercion. Mr. Beaman believes that the company stores have very little effect in keeping individual enterprises out of any community. In all the company's mining towns of any consequence there are strong rival stores. The company does not try to keep them out; it sells them lots if they want them. Whatever amount of the men's pay in any month has not been covered by store orders is paid in cash on the pay day of the next calendar month. Mr. Beaman does not believe that his company has ever discharged a man because he refused to deal with the store. He has never known preference to be given to a man of large family as against a single man or a man of small family. He has never heard that a company has employed more men than it needed, giving them work only a part of the time, in order to increase the trade of the company store. One of his company's policies is to try to satisfy the miners. (262, 263, 276-278, 290.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that there is no store in which that company or its members have any interest. There are one store and one boarding house which the company protects by deducting from the wages of the men the amount of their bills so far as they O. K. them. The company receives no profit or commission for this service. A small amount, \$20 or \$25 per month, is paid to the clerk for doing the work. There would be no objection to protecting other concerns in the same way, aside from the time and trouble required to keep the books. The payment to the clerk does not probably equal 1 per cent of the bills. The witness would consider 5 per cent an excessive charge for the bookkeeping involved. The witness never heard of any complaint from the workmen on account of the existing system.

As to the probability of increased charges to the workmen under this plan, the witness suggests that the storekeeper, knowing that he is sure of his money, can afford to sell cheaper than if he took chances. Mr. Newhouse does not know of any store in Colorado that sells its goods for cash without some credit. A comparison between the system used in connection with his company and a system of strictly cash payments by the men would be misleading. The cash system would not exist. He has investigated the subject and has found that the store in Bessemer sells goods to the men at the same price which would have to be paid at any store in Pueblo, and apparently of similar quality. (296, 302, 303.)

2. *Company stores in Utah.*—Mr. THOMAS, State coal-mine inspector of Utah, referred to a case in which orders are issued by a mining company upon a store owned by a separate corporation, and are not available at any other store. They are in the form of a book, containing coupons of 5 cents, 20 cents, 25 cents, etc. Though this is an exclusive arrangement with one store, Mr. Thomas does not think that the store pays the mining company any commission. The prices at the store are reasonable. He has never heard any complaint about the system. The men have the privilege of trading where they like, and Mr. Thomas does not think that a man who should take all his earnings in cash would be put at any disadvantage by his employers. Some of the miners do their trading in Salt Lake City. (625, 629.)

Mr. SHARP states that at the mines of the Pleasant Valley Coal Company there are stores, owned by a separate corporation, on which the coal company issues orders to the miners. The miners can buy as cheaply at the company store as elsewhere. They are not required to buy there. Some of them have cash for their purchases, and they spend their cash more freely at the company store than elsewhere, though there is no discrimination against men who go to other places. (641.)

Mr. ALLEN, a Utah mine operator, says that his company has no store system, and that he does not know of any mine which has. The usual custom is to pay in time checks, which are generally cashed at some store. In the case of his own company, while the time checks are cashed at a store, the men receive their pay in money if they demand it, and there is no pressure put upon them to trade at the store in question. Orders in favor of other stores are often given, and are honored by the store which does the paying. The store doubtless gets its compensation in the custom which it gets through the bringing of the men to its place of business. (570, 578.)

Mr. TERHUNE, recent manager of the Hanauer smelter, states that his company had no store, nor any interest in one. It issued store orders to men who wanted them, but the orders were not directed to any particular store and could be used wherever the men pleased. He does not believe in the company-store system. (595.)

Mr. HANAUER states that the store-order system is not used to any extent in metal mines in Utah. (608.)

Mr. CHAMBERS, mine operator, says that company stores are not usual in connection with the metal mines of Utah, although there are some. (585.)

Mr. CALLIS, county attorney of Summit County, Utah, and formerly a coal miner, says that he believes there is no law in Utah against company stores, but he never worked for a company which had stores. (632.)

3. *Company stores in Idaho.*—Mr. BURBIDGE says there are probably no company stores in the strict sense in the Cœur d'Alene district, though there are stores in which some of the mine owners are interested. He has heard of no coercion to deal at such stores and of no complaints. The Bunker Hill Company has no store, but the miners frequently give to various stores orders upon their wages in payment for goods. The stores collectively send an agent to the company on pay day to settle the accounts. (460, 461.)

Mr. CREEDON, a miner, denies the claim that the Bunker Hill and Sullivan Company did not force its employees to deal at stores. He says that he questioned a business man of Wardner regarding this statement after it was made by Mr. Burbidge, and that he told him it was not true. (525.)

4. *Company tenements.*—Mr. COATES, of the Federation of Labor of Colorado, says that in connection with the Colorado mines there are many company houses—not houses, but usually cabins, separate from each other, that the men are required to live in. In some parts of the State they can not live in anything else, because of the advantage the companies have by the rent and because the companies will not sell land for houses. The system gives the companies a great advantage over the men. If they wish to get rid of a man, they need only to refuse to rent him a house. In case of strikes, those who are living in the company houses and trading in company stores are compelled in a short time to go back to work or leave the community. Rents of company houses can not generally be compared with neighboring rents, because there are generally no other houses in the place. In the city of Pueblo, where the employees of the company are not compelled to live in company houses, the rents are fair as compared with the others. In other Colorado camps Mr. Coates thinks that in comparison with the wages the men get the rents are unreasonable. The employers say that it is a matter of convenience to provide houses for their men where otherwise there would be no habitable places. Mr. Coates thinks that if the companies did not build houses and establish stores, other men would set up stores, and the miners themselves, or others for them, would build houses. He does not think that the companies would suffer from a shortage of labor. (252.)

Mr. BRAMAN, secretary of the Colorado Fuel and Iron Company, describes the company tenements as good frame houses, usually painted and plastered, and having from 3 to 5 rooms. They are rented to such employees as desire them at a reasonable rent, based on the cost. Many others buy lots and build their own houses. Others prefer to save rent or the cost of building good houses and erect poor "shacks." This latter class as a rule have more money saved up than the others.

The company has built reservoirs and pipe lines at several of its mining towns, conveying the water to hydrants in the streets, where it is furnished free to the residents. Trees have also been planted along the streets and watered from this supply. (265, 278.)

Mr. SMITH, deputy commissioner of labor, says that the coal-mining companies in Colorado to a considerable extent furnish tenements for their employees. These are

mere cabins, and they rent at from \$4 to \$6 per month. The system gives employers a great advantage in time of strike. (218.)

Mr. CLARK, miner, states that there are no company houses in the neighborhood of his working place. (333.)

Mr. WRIGHT states that the American Smelting and Refining Company furnishes no dwellings for its men at Denver. (307.)

5. *Company boarding houses.*—Mr. SULLIVAN, a metal miner of Colorado, states that some of the mining companies run boarding houses, and that the men are generally compelled to board there. The rates for board run from \$5 to \$7 per week and the men are obliged to furnish their beds. Board and lodging can generally be obtained in private houses for about the same price that the companies charge for board alone. The witness refers to one instance in which a strike took place on account of the poor food furnished by the company boarding houses. The company boarding house is sometimes managed by an employee of the company, sometimes by a person who pays the company a per cent of the receipts, and sometimes by one who pays a fixed rent. (350, 353.)

Mr. THOMAS, State coal-mine inspector of Utah, says that it is the general custom of the Utah coal-mining companies to run company boarding houses. It is not customary to compel the men to board there, nor to give a preference to those who do board there. (625.)

Mr. TERHUNE, recent manager of the Hanauer smelter, states that it formerly seemed necessary for mines and smelters to run company boarding houses, but recent experience has proved that it is not necessary now. His company formerly had a company boarding house where single men were required to board. The men objected to the system, and the compulsion was finally removed. When this was done, the men went away and took board at the neighboring farm houses, where they could get more social and home life. The company had to reduce the rent of the boarding house from \$80 to \$20, and in some cases let it go entirely. Around the mining camps there are none of these little farms that offer the attractions which the Hanauer smelter men found; but Mr. Terhune does not consider that the fact that the men live in a company boarding house under compulsion without protest would prove that they were satisfied with the conditions. He does not believe that such a system is consonant with the rights of American citizens. (594, 595, 603, 604.)

Mr. CALLIS, formerly a Utah miner, says that there are no company boarding houses in his district. He believes that where there are company boarding houses in Utah the men take it as a matter of course that they are expected to board at the company house. (631-633.)

Mr. ALLEN, a Utah mine operator, states that his mining company owns a boarding house, where the unmarried men are required to board, unless a man is excused for some particular reason, such as his desire to live with a mother whom he supports. The charge is now 80 cents a day. Formerly, when wages were \$3 per day, the price of board was \$1 per day. The boarding house has not been run for profit, but to give good board without regard to cost. Mr. Allen has never heard any complaint from the men. It is the general custom in Utah to have company boarding houses. There was a strike in the Tintic district several years ago on account of the requirement to board at the company boarding house. The present tendency among mine owners is to get rid of the company boarding house. (569, 570.)

Mr. SHARP says that the Pleasant Valley Coal Company has a boarding house at one mine and charges 75 cents per day for board. This is about the same rate which is charged by other boarding houses at the same place, and the fare is as good. The men are not required to board at the company house. (641, 642.)

Mr. HANAUER, of Utah, states that there has not been any company boarding house at which men have been compelled to live at his smelter or his mines. His company had a house at which the men were provided with sleeping apartments, "and they paid \$1 per month each for taking care of the rooms." (608, 609.)

6. *Compulsory hospital and physicians' fees.*—Mr. WRIGHT, of the executive board of the Smeltermen's Union, says that at the Denver smelters of the American Smelting and Refining Company each man is required to pay \$1 a month as hospital fees. The money, amounting to \$1,100 or \$1,200 a month, goes to a physician selected by the company. If any of the men need a physician's care they are taken to the hospital and the company physician treats them and pays all expenses. The witness has seen 10 or 12 men in the hospital at one time. At other times there may be no one there for a month. There is an average of one or two the year round. The payments mentioned do not cover any medical services to the men's families. If medical treatment is needed for them the company physician is generally employed, because the men are acquainted with him. The witness is satisfied with the existing system. There is, however, a good deal of dissatisfaction with it among the men.

It is expected that the Smeltermen's Union will protest against it and that it will be abandoned. Mr. Grant, the trust's manager in Denver, is willing to abandon it, saying that the present antiscrap law forbids taking the dollar from the workingmen's wages, and that he would rather have nothing to do with it. (307, 317, 318.)

Mr. CHAMBERS, mine operator, states that it is usual in the metal mines of Utah to deduct \$1 a month from the wages of the men for medical service. If they are sick or injured they are taken to the hospital and receive the best medical treatment. (585.)

Mr. ALLEN, mine operator, Utah, says that at his mine \$1 a month is deducted from the wages of the men and paid to a company doctor, who gives them necessary advice and prescriptions and pays their expenses at the hospital if they are sick or hurt. He does not know whether the miners are required to pay the \$1 a month, nor whether the payment covers the necessary treatment of the men's families. (578.)

Mr. SHARP says that the Pleasant Valley Coal Company requires the married men to pay \$1 per month and single men 50 cents per month for medical and hospital service. The men could not get the services of a doctor and medicine and hospital treatment so cheaply in any other way. The company doctor treats the families of the married men and furnishes medicine. The men formerly demanded a voice in the selection of the doctor, and their choice was generally unsatisfactory both to the company and to themselves. They are not now consulted in the matter, and the choice of the company has caused no complaint during the past six or eight years. (641.)

Mr. CALLIS, county attorney of Summit County, Utah, says that the men in Coalville pay \$1 per month for doctor dues, but do not object to the practice, and think it is for their benefit. There is no hospital in Coalville. (632.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, says that it was the custom of that company to deduct \$1 per month from the wages of the men for medical and hospital service, but the men were not restricted to one physician or one hospital. There were two physicians and three hospitals which they could choose from. (595.)

H. Hours of labor.—1. *The Colorado eight-hour law—opinions of workingmen.*—In Colorado, according to Mr. SMITH, deputy labor commissioner, the usual hours of labor hitherto have been 10 in the mines and 10 or 12 in the smelters. The 8-hour law enacted in 1899, applying to mines and smelters, went into effect June 15. The witness thought (in July, 1899) it had been generally complied with. He believed that the 8-hour day was advantageous in giving workmen more time for recreation, study, and rest, and was especially desirable in mines on account of the injurious gases. The use of machinery makes it possible to produce more wealth with a given amount of labor than formerly, and this justifies a gradual reduction in the hours of labor. The effect of such a reduction is to increase wages. (220, 226.)

Mr. COATES, president of the Federation of Labor of Colorado, says that the new Colorado 8-hour law applies only to mining and to smelters and institutions for the refining and reduction of ores and metals. He knows of no instance where it is not observed, except by the American Smelting and Refining Company. Many of the organized laborers had been working 10 hours a day in mines and mills, but he believes there was no other instance in which a satisfactory arrangement for complying with the law was not effected. He has, however, very little faith in the efficacy of such laws, except where there is an organization to enforce them. He believes that organizations without laws can obtain the same results, and usually better. (247.)

Mr. CLARK, of the Western Federation of Miners, states that the working day of coal miners was formerly 9½ hours at Louisville, Colo. When the 8-hour law went into effect the mines complied with it. The production per man per day was very little decreased. Under the old system the men would get tired and quit loading at 4 o'clock. The actual working day seems scarcely to have been shortened by the law. (333, 334.)

Mr. Clark thinks that the shortened workday improves the social condition of the workingmen, and he believes it will improve his economic condition, though he regards this as a thing still to be proved. (332.)

Mr. SULLIVAN, a Colorado metal miner, states that the hours of work have heretofore varied from 8 to 12 in the metal mines in different districts. The variation is caused chiefly by the varying efficiency of labor organization. (347.)

Mr. Sullivan says that the 8-hour law shortened the hours of miners in some places, but is not likely, in his judgment, to have any considerable effect. The agitation of the question and the consequent enlightenment of the public will doubtless have effected something. Wherever an 8-hour day has once been secured the workmen are not likely to submit to a backward step. Whatever gain has been made is

to be credited to organized labor. The law itself and the agitation which led to it are the work of the labor organizations. (354, 359.)

Mr. Sullivan believes that the shorter workday tends to elevate the men—to lead them to read more and think more. His miners' union has been agitating the 8-hour day for years, and has succeeded in getting it by law in Utah. The labor organizations could secure the 8-hour day by the strike, but they do not like to strike. He does not think it possible to get it without a strike. If a man is fair he will do in 8 hours all that a man is able to do in a day. A mine can produce more with 8-hour shifts than with 10-hour shifts. Only two 10-hour shifts can work in a day; three 8-hour shifts can work. (354.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, says that 12 hours a day is an unreasonable time to work in a smelter, because of the injury to the health from the lead, the heat, the dust, and the furnace fumes. It is impossible for men working such long hours to work over 22 days in a month. At the smelter where he works the men have tried at least two or three times to get the 12-hour shifts changed to 8-hour shifts. The management absolutely refused, except in the case of about 60 men, some 2 per cent of the whole number of employees. The men refused to accept this small concession. The question of the 8-hour day had been discussed more and more earnestly for a year before Mr. Wright's testimony. The demand was actually made when the Colorado 8-hour law came into force. The witness thinks it would have been made, however, if the law had not been enacted. The law furnished a favorable occasion, and the men were able to stand upon the platform of a refusal to violate the law.

The smelter trust was willing to grant the 8-hour day to the furnace men, the feed men, and the roasters, who were working in 12-hour shifts, provided they would accept a certain rate of wages. It would not grant the 8-hour day on any condition to the common laborers, who were working 10 hours. The claim was that two shifts would have to be put on in some places, where one set of 10-hour men could do the work. For instance, the company claimed that it could not crush enough ore in 8 hours to last 24, while they could crush enough in 10. (306, 308, 318-321.)

2. *The Colorado 8-hour law—statements of employers.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, says that the Colorado 8-hour law, as originally introduced, had no relation to questions of health. It was not pretended to have any other purpose than that of increasing wages and shortening the hours of labor. The Utah law was finally substituted because it had been declared constitutional in Utah, and it was hoped that the Colorado court might be induced to overrule its former decision, and permit at least a start toward the universal 8-hour day. Such legislation is peculiarly inapplicable to coal mining, since the coal miner is the healthiest of all workmen. The even temperature of his working place gives him a great advantage over outside workmen. He is not exposed to the dripping of water, as men often are in metalliferous mines. He is not affected by gases, because these, whenever they exist, must be dispelled by powerful air currents from steam fans in order to prevent explosions. These fans give the coal miner a constant supply of pure air. The Colorado act makes no distinction between mines well or ill ventilated, wet or dry, or between those workmen in the smelters, for instance, who are exposed to the furnace heat and fumes and those who are not. It makes no effort to help those who are most in need of the shortening of their hours of labor, namely, the women.

If the shorter workday were accompanied by advanced ideas and means of spending the leisure time, it might be advantageous to the workmen. The way in which the men now spend their leisure indicates that the gain from more physical rest would often be more than offset by the physical injury received and the money spent in dissipation.

The 8-hour day is economically impracticable for coal mining, because of the conditions of the mining of bituminous coal. Disintegration and the cost of handling forbid its being stored at the mines to await orders. During the winter, when the demand is great, the miner puts in 10 or 12 hours per day, and, since he works by the ton, earns correspondingly more. If he worked only 8 hours, it would be necessary to employ 25 or 30 per cent more men. In the summer, when the demand is light and most mines run on half time or less, these additional men would have to have their share of work, and the earnings of all would be correspondingly reduced. Even if the miners themselves were permitted to work over 8 hours, it would be necessary to have extra men to work the 2 or 4 hours over the 8-hour shifts of regular drivers, etc., in order to draw out the coal and keep the timbering along with the excavations. This would be impracticable. The consequence is that the Colorado Fuel and Iron Company's outside men, "seeing the inequality and injustice of the law, are voluntarily working 10 hours."

The 8-hour day will increase the cost of production both in wages, if it raises rates as it is meant to, and by requiring increased equipment for the same capacity, as experience has shown in Illinois. If accompanied with 10 hours' pay it will close many low-grade metalliferous mines, compelling their employees to seek employment elsewhere, and injuring or ruining their owners. The 8-hour day has been in operation for years in some parts of Colorado where rich mines and other conditions enable the employer to bear it. If it ought to come it will come in other places by natural conditions and in such a way as not to disturb the relations of employer and employee. The legislative 8-hour day, if enforced, would be particularly injurious to the steel workers of Colorado, which have to compete for their heaviest business with the cheaper labor and iron ore of the Eastern States. (279-281, 290, 291.)

Mr. Beaman states further that his company sent one of its officers to Hawaii, China, and Japan in January, 1899, to solicit orders and establish agencies. "The disturbance and uncertainty caused by the passage of the 8-hour law, in connection with a temporary rush of local business," made it necessary to recall him. The company can not hope to meet existing competition if its cost of production is to be increased to the extent that is expected if the 8-hour law stands. All Colorado industries having a market through or at the Pacific coast will be entirely excluded therefrom or greatly handicapped if 8 hours' work for 10 hours' pay is to be the rule. (283.)

Mr. GRANT, of the smelters' combination, which was at the time engaged in opposing a strike for the payment of the previous rate of wages despite the reduction of hours to 8, testified that he thought that it would indicate a prosperous condition if men could earn enough in eight hours to satisfy their needs. No man works except from necessity, and shorter hours are clearly advantageous in themselves. But the witness does not think that as much can be done in 8 hours as in 10 or 12, especially in view of the uniform capacity and speed of machines. The question is therefore whether employers can afford to reduce hours and still pay the same wages, or whether men will be willing to accept lower wages. If they are not willing to work for less pay and if employers can not give more per hour, the men should be allowed to work longer hours. The witness admits, however, that the tendency of improved machinery is to displace labor and create a surplus, which would apparently, in some cases, justify reduction of hours. (209, 210.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that before the 8-hour law went into effect, June 15, 1899, the men worked from 9 to 12 hours per day. The smelter is so situated that if a man works 12 hours per day in it, he is practically 14 hours away from home. The witness considers that too long, and is glad to change 12-hour shifts to 8-hour shifts. The work of tending a furnace is not severe or continuous. Six hours of labor would cover the full amount of actual work on a 12-hour shift. Either 8 or 12 hours must be worked on those furnaces which have to be continuously in operation. In other situations the witness thinks 10 hours is a proper length for a working day, and that the men would prefer to work 10 hours and get correspondingly larger pay. The witness indicates, however, that when the question was presented to the men of working 8 or 10 hours they generally expressed a preference for the 8-hour day, with some moderate increase in the rate per hour. The witness suggests that the men were moved by a desire not to break the law.

The cost of smelting will necessarily be somewhat increased. The company had meant to raise the wages 10 per cent in any case, but wages per hour have in fact been raised 30 or 35 per cent. Mr. Newhouse does not think the product per man per hour is increased by the shorter work day. The 8-hour day had been tried only 1 month at the time of his testimony. He was not sure whether the business could be carried on at a profit under the changed conditions. If treatment charges were increased on low-grade ore, production would be shut off. Consequently he did not believe that charges on such ore would be increased by any smelter. He is not prepared to say that the 8-hour law affects the smelting industry unfavorably. If it is found possible to run the business at a profit on the present basis, his company will continue with the 8-hour day, whether the 8-hour law is held constitutional or not. (295, 299-302, 305.)

Mr. HILL, of the Argo smelter, considers the 8-hour law as involving a positive loss, an annihilation of value, in so far as it compels men who are perfectly able and willing to work 10 or 12 hours a day to stop work at the end of 8 hours. The extra time, and the products that might be obtained in it, can not in any way be made up. It is possible that a man may accomplish a little more proportionately in 8 hours than in 12, but the difference, in the case of such work as that about the Argo smelter, is exceedingly slight. (377, 378.)

The witness states further that it is necessary that the furnace men, roasters, and

feeders work either 12-hour shifts or 8-hour shifts, because the works must be in operation throughout the 24 hours. If the same wages were to be paid for 8 hours which have been paid for 12, either the works would have to close down or the charges for treating ore would have to be increased. An increased charge for treatment would stop the mining of large quantities of low-grade ore. To reduce the wages of the men who have been working 12 hours proportionately to a reduction of working time to 8 hours, would reduce their standard of living to a very injurious extent. Mr. Hill believes that the time is gradually approaching when we shall have the 8-hour system, but he does not think the proper time for it has yet come. He regards the existence of a large number of unemployed men as a valid argument for the 8-hour day on the ground that it would be advantageous to distribute the work that is done among all the people who want to work. He denies that in the Argo smelter the 12-hour men leave their work exhausted or that their health is impaired by it. He asserts that they work year after year with practically no loss of time on account of sickness. The 10-hour men are generally anxious to get promoted to 12-hour shifts on account of the greater pay that is made there. (371, 381.)

Mr. Hill states that when the 8-hour law went into effect, the Argo smelter submitted the question to its employees whether they would prefer to keep the works running and be paid proportionately to the hours they worked, while the question of the validity of the law was pending before the courts, or whether they would prefer to have the works closed. They preferred to go on with the proportionate reduction of wages. This was regarded as a temporary arrangement. (370, 371.)

Mr. LEE, mine inspector of Colorado, does not think that legislation should attempt to fix the hours of labor. Conditions differ, so that it may be better for men to work 10 hours in one place and only 6 in another. Employers in Colorado mines often work their men only 6 hours and sometimes only 4 where the sanitary conditions are bad. While the mining industry was prosperous when the 8-hour law was passed in 1899, and while some mines could afford to raise wages, many others were working so close that it would be impossible to pay 10 hours' wages for 8 hours' work. The witness thinks that when mines are developed and worked on a large scale they can afford the 8-hour system, and are usually inclined to adopt it without legislation. (235, 242.)

3. *The Utah 8-hour law.*—Mr. HAMMOND, secretary of state of Utah, says that the constitution of that State provides that 8 hours shall be a day's work on all public works of the State or any of its divisions, and that the legislature shall provide by general laws for the safety and health of employees in factories, mines, and smelters. The act of the legislature restricting the working day to 8 hours in underground mining and in smelters has been upheld under this clause by the supreme court of the State and by the Supreme Court of the United States in the case of *Holden v. The State of Utah*. Mr. Hammond considers the law very beneficial to the working people and not injurious to the employers, and he believes it is generally satisfactory. (618.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, states that since the reduction of hours from 12 to 8 by the Utah 8-hour law, January 1, 1896, the men are better off as regards health and efficiency, and he thinks morally better off also. The change of hours made it necessary to employ about 30 per cent more men. The net increase of cost of labor was about 10 per cent, but the men work so much more efficiently that the smelting company is no worse off. Though the shortening of hours was accompanied with a considerable decrease of daily wages, the change was generally desired by the men, and the men are able to work so many more days per month that their monthly earnings are hardly lessened. He thinks that the men did not formerly work more than 24 days per month, and that with the 8-hour day they work nearly 30. The operation of the law on the whole is distinctly beneficial. (591, 592, 596.)

Mr. Terhune says further that it is the belief of mine owners generally, so far as he knows from conversation with them, that they get practically as much work under the 8-hour system as under the 10. The shorter hours give satisfaction to the men, give them increased opportunity for recreation, and make them feel that their rights are recognized. Moreover, their intelligence is quickened with increased opportunities for study and recreation. The more intelligent laborer is everywhere more effective. (592.)

Mr. CHAMBERS, mine operator, says that the 8-hour law of Utah applies only to mining. As so applied he considers it entirely satisfactory. An attempt was made in the last legislature to apply the 8-hour system to men working upon the surface. It failed, because surface work was not considered so dangerous to life or limb or so unhealthful. (584.)

This witness says further that the miners generally advocated the 8-hour law, and

the mine owners as a rule concluded that it might be better to try it and see how it would operate; and by not opposing it in the legislature they let it become a law. They thought it might be the means of keeping down unions and strikes. A clause in the State constitution gave the legislature power to enact such a law. (589.)

Mr. CHAMBERS says that if mines are properly managed they can get about as much product from men who work 8 hours as from men who work 10. In the case of his own mine the 8 hours are reckoned continuously, say from 3 o'clock to 11. The men are at the working place when the period begins and do not leave until the period ends. They are allowed about 20 minutes for lunch, without deduction of pay. Mr. Chambers regards the system as satisfactory. The men seem to be more ambitious to do an honest day's work than they used to be when they worked 10 hours. The foreman does not find them asleep nor "smoking the pipe a bit." Moreover, the foreman is probably more stringent in his demands than he was under the 10-hour day. (584, 587, 588.)

Mr. SHARP, superintendent of the Pleasant Valley Coal Company, says that its miners receive the same rate per ton under the 8-hour law as formerly when they worked 10 hours, and that they produce about as much in 8 hours as formerly in 10. When the 8-hour law was adopted in Utah the company at first paid the same rate per hour to day laborers which had been paid for 10-hour days. It has found it necessary to pay the same daily wage for 8 hours as formerly for 10, in order to get men enough. This is of course a disadvantage to the company, and there is a further disadvantage in that the plant is used only 8 hours instead of 10 during the 24. To keep up with the more rapid work of the miners it is necessary to employ more drivers and other day laborers, timber men, etc. (639.)

Mr. HANAUER, recently owner of the Hanauer smelter, Salt Lake City, states that wages at that smelter were reduced 10 per cent at the time of the panic of 1893, and that when the Utah 8-hour law took effect the old rate of wages per hour was restored with an 8-hour day. He does not think that the reduction of hours materially increases the efficiency of the men in a smelter, because a furnace takes a given amount of material and no more. In mining the men probably do as much in 8 hours as in 10. He does not think this is true of common labor. Some of the mines worked three 8-hour shifts before the 8-hour law went into effect. The 8-hour law is generally satisfactory to both employer and employee in Utah. (610.)

Mr. ALLEN, mine operator, states that underground men in Utah mines generally worked 10 hours per day before the passage of the 8-hour law in 1896. That law has been generally observed. In Mr. Allen's mine the shift goes on at 8, works until 12, goes off for dinner, goes back at 1, and works until 5. The men are lowered before the hour and are at their working places when the hour for work begins. They leave their working places in time to be at the bottom of the shaft when the quitting time comes. Under the 10-hour system, in cases where the men took their lunches into the mine and ate it there, the lunch period came out of the company's time. (571.)

This witness believes, from the expense account of his mine and the amount of work that is done, that the men accomplish as much in 8 hours as they accomplished in 10. The general effect of shorter hours upon the men can not but be good. (571, 572.)

Mr. THOMAS, State coal mine inspector of Utah, says that the effect of the 8-hour day has been very favorable upon the social and intellectual conditions of the Utah coal miners. The mine operators are perhaps a little worse off, in that their plant lies idle a greater portion of the time. The men produce very nearly as much in 8 hours as in 12. It would be a good thing if the 8-hour law were adopted generally for manufacturing and other vocations. (626-628.)

Mr. CALLIS, formerly a miner, thinks that the 8-hour law of Utah has been of great benefit to miners, has resulted in marked improvement of their social and intellectual condition, and has had no noticeable effect upon the employers. (631, 636.)

4. *Sunday work.*—Mr. HAMMOND, secretary of State, says that the law of Utah forbids unnecessary work on Sunday, and that it is generally observed, though work in smelters and other work of the kind continues on Sunday. (620.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, states that he regards it as highly advantageous to give men 1 day of rest in 7. Smelters must run continuously, but under his management men were able to get 1 weekly rest day if they desired. The mines that he is familiar with run on Sunday. For this there is no industrial or technical reason. There may be a moral reason, in that the miners in some camps would not know what to do with themselves if they did not work, and might spend their time at saloons, particularly where there are no churches. (596, 603.)

Mr. HANAUER, a former smelter owner, Utah, says that smelters necessarily run on Sundays, though it is usual to have relief men, so that it is not necessary for a par-

ticular man to work continuously. Indeed, during the summer months the men habitually take vacations, and do not work more than 20 days per month. Sunday work is regularly practiced in many mines. It would be better if the men had Sunday off, provided they would actually rest. The most of them, instead of resting, would carouse and spend their money foolishly. They are better off working steadily. (610, 611.)

Mr. CHAMBERS states that in his mine, at Park City, Utah, the men are generally laid off on Sunday, except so many as are necessary to keep the mills running. A mill can not be shut down any more than a smelter; it costs nearly 2 days' work to shut it down and start it up again. It would be better if Sunday labor could be avoided, provided the saloons, dance halls, and gambling houses are closed and the miners can go to church or get recreation that will not injure them physically. (588.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, Colo., states that all work that can be stopped on Sunday is stopped, such as construction work and the smelting of bullion; but a portion of the furnaces have to be run continuously. The roasting men work 7 days per week until they fail; then they take a rest for a week or two and come back again. (297.)

Mr. THOMAS, State coal mine inspector of Utah, says that the men generally work 6 days in the week in Utah coal mines. (625, 626.)

Mr. SHARP, of the Pleasant Valley Coal Company, Utah, says that its miners do not work on Sundays except when the mine is crowded with orders. (639.)

Mr. ALLEN, mine operator, has given careful attention to the results of Sunday work, and is convinced that the men lose as many days in a year, or more, if they try to work 7 days in the week than if they rest on Sunday. He believes it would be better for the men and for the company if no Sunday work were done, unless on account of some absolute necessity, such as pumping a wet mine. The general practice in Utah is to work on Sundays. (571, 578.)

I. Safety and sanitation of mines and smelters.—1. Inspection of mines.

Colorado.—Mr. LEE, commissioner of mines of Colorado, testifies that there are two inspectors in connection with his office, but that the force is entirely inadequate. The inspectors have never been able to get around to all of the mines. They are continually making inspections, but most of them are on the basis of complaints, and the inspectors are compelled to go from one side of the State to the other on this account. No attention is paid to complaints not signed in good faith. Many complaints are made in spite of discharged men, but there are also many valid complaints. The employers often ask for advice from the inspectors and are always willing to have them enter the mines. Mr. Lee thinks four more inspectors would be needed to do the work satisfactorily. (234, 236.)

Mr. CLARK, of the Western Federation of Miners, states that the Colorado laws regarding the safety and sanitary condition of mines are entirely worthless, because they are not enforced. The law requires that mines be examined once a month; he does not think they are examined oftener than once in 6 months. There is only 1 inspector with 1 deputy, and he does not believe they could make examinations oftener. Even when the inspector directs changes to be made these directions can not be enforced for lack of penalties. He contrasts the condition in Colorado with the condition in England, where, he says, the inspector's department is one of the institutions of the State, and mine owners have to attend to the ventilation and sanitary condition of their mines. (327, 338.)

Mr. SULLIVAN, a Colorado metal miner, says that there have been mine inspectors in that State for about 10 years. He has been mining in the State during the most of that time, and he has seen a deputy inspector just once. The inspector went through a mine where there were about 200 men in about 20 minutes. The mines ought to be inspected at least once in 3 months. The companies think that men are cheaper than timber, and leave the mines insufficiently supported. The timbering and the machinery, as well as the ventilation, ought to be carefully looked after by the State. (358.)

Mr. DOYLE, a director of the Portland Gold Mining Company, says that the mine-inspection laws of Colorado amount to nothing. The force of inspectors is not sufficient to enforce them. The mines should be inspected every 30 days. In practice no mine is inspected except after a man has been killed. Mr. Doyle thinks that the sanitary and personal-safety mining laws of Colorado are sufficient if they were enforced; but they are not enforced. (369.)

Mr. BEAMAN, of the Colorado Fuel and Iron Company, says that the laws relating to mine escapes, ventilation, and other appliances, and inspections, have been of no disadvantage to the coal mining industry. Just such things were used before the law was passed. The companies generally go even beyond what the law requires. (266.)

2. *Inspection laws, Utah and Idaho.*—Mr. HAMMOND, secretary of state of Utah, states that there is a law in Utah for the inspection of coal mines, but none for the inspection of metal mines. He does not know why the metal mines are not included. There has been no agitation of the question, and he supposes that the laws are regarded as sufficient. (618, 619, 622.)

Mr. THOMAS, State coal mine inspector of Utah, says that though there is no inspection law for the metal mines of the State, one is as much needed for them as for coal mines. Several efforts have been made in the legislature to get such a law, but they have been defeated through the opposition of the mine owners. (628, 630.)

Mr. Thomas states that it is his duty to inspect the coal mines of Utah, both when called upon and of his own motion. He has no assistants. The coal mines of Utah are in good condition. (622, 629.)

Mr. CHAMBERS, mine operator, states that while there is a law for the inspection of coal mines, it does not apply to metal mines. There are no regulations as to the ventilation or timbering or safety appliances of metal mines. (585.)

Mr. CALLIS, county attorney of Summit County, and formerly a coal miner, says that the absence of a mine inspection law for the metal mines of Utah is due to the opposition of the owners. When he was in the legislature a bill was introduced to regulate the metal mines, but the preponderance of feeling seemed to be against it, and it was defeated. Mr. Callis voted against it, believing that the measure was not suited to correct the evils it was aimed at, though the silver miners need protection, and the silver mines are just as much in need of proper means of ventilation as the coal mines. The larger mines are very well ventilated. The air which is pumped in to work the pneumatic drills is a considerable aid in ventilation. The worst lack of ventilation appears in the small mines worked by prospectors, and in this fact lies one great difficulty in the application of a law. (636, 637.)

Mr. Callis thinks that the Utah laws regarding ventilation should be a little more strictly enforced. The ventilation of coal mines has recently been much improved, but in some of the most active mines there is still need of improvement. (633, 634.)

Mr. BURBIDGE thinks that the mining inspection system in Idaho is a rather perfunctory affair, and that the mine owners themselves are inclined to keep their mines in a safe condition and well ventilated without any legal regulations. (459.)

3. *Sanitation and safety of metal mines.*—Mr. ALLEN, mine operator, states that the best metal mines of Utah are kept in good condition and well ventilated. The man who is up to his business knows that he is the loser if he does not have proper ventilation. If the mine is not cleared of smoke the men can not work properly. Moreover, the good miners see that this matter is attended to. (576.)

Mr. SULLIVAN states that a good many lives would be saved every year by the use of a cage inclosed at the sides so that men could not fall or be knocked from it. Many cages have safety catches, but not all. Accidents do not often happen for lack of them. There should be a limit to the depth that can be worked with one bucket. When a certain depth is reached the company should be required to set a hoist at a station down in the mine. The use of excessively long single lifts, running from 300 to 900 feet, greatly increases the danger. (357.)

Mr. Sullivan regards electricity as an unsafe motive power for mines. He has known of the killing of a number of men in the Cripple Creek district by electric hoists, through the accidental charging of the hoisting apparatus. The operation of the electric hoist is also uncertain. (356, 357.)

Mr. Sullivan states that the ventilation of the metal mines is generally very poor. There is no regular system of ventilation. Occasionally, in particularly bad places, a fan is put in which blows air through a pipe into a certain drift or sometimes into 3 or 4. It is not usually attempted to ventilate the whole mine. One man was recently killed in the Cripple Creek district on account of bad air, and another is in the hospital on account of injuries received through being overcome by bad air. It is a common occurrence for a man to become senseless from this cause. He is generally carried out and lies somewhere until he gets over it, and then goes to work again. (357, 358.)

The witness states further that the smoke of the blasting powder is one of the causes of bad air in the mines. The men are expected to shoot the blasts at the ends of their shifts. If one shift does not follow another immediately, as it need not if they work 10 hours, the smoke may have time to get out before the next shift comes on. There is no opportunity for it to escape if one shift follows another immediately; and this is especially likely to happen with 8-hour shifts. When men work 8-hour shifts they usually take about 20 minutes for lunch. If they would set off the blasts just before going out to lunch, the 20 minutes would give the air a chance to become nearly clear of smoke. (358, 359.)

4. *Sanitary conditions, smelting, precious metals.*—Mr. TERHUNE, recently manager of

the Hanauer Smelter, Salt Lake City, states that the health of the men in that smelter is injured by the fumes of arsenic, sulphur, and lead. There have been great improvements in recent years in apparatus for disposing of these fumes, but they can not be altogether got rid of. The health of the men necessarily suffers, and it is especially desirable in this work that the hours of daily labor should be short. (592-594.)

Mr. WRIGHT, of the Smeltermen's Union, states that in most plants which he has worked in there are systems for taking away the smoke and cinders, but that no such appliances have been put in at the Grant smelter at Denver. The managers have promised to do it, but "always gave some cause or other for not doing it." Mr. Wright believes that the general sanitary laws of the State and the laws for the ventilation of mines are well enforced, and that in the mines there is no disposition to ignore the laws or the health or safety of the laborer. A man of some education is likely to protect himself better against any sort of danger than the more ignorant workmen. (315.)

Mr. HILL, of the Argo smelter, Denver, says that there is no healthier occupation than working in that smelter. Lead is not used there. The fumes in the lead smelters were formerly very injurious to the health of the men, but it is his impression that improvements have been introduced which have nearly or entirely done away with the injurious effects.

The Argo smelter uses copper instead of lead for concentrating the gold and silver. There are no injurious fumes in copper works. Even those men who work 12 hours do not leave the work exhausted. They do not actually labor over 6 hours, and they are always fresh. Practically no time is lost on account of sickness. (371, 376, 377.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, states that the sanitary condition of that company's works is very good. It has built hoods over the furnaces, and has exhaust fans to take out all nauseous gases. The health of the men has improved wonderfully in the last few years, so that they generally continue at work a great deal longer than before. (301.)

5. *Compulsory accident insurance. Colorado.*—Mr. DOYLE, a director of the Portland Gold Mining Company, states that the most of the mines in the Cripple Creek district have blanket insurance policies, exempting them from liability for accident; \$1 per month is deducted from the wages of each man to cover the premiums. When a man is killed the insurance company settles with the widow, usually after a suit in court. The men have no discretion about the payment of the \$1 a month. (368, 369.)

Mr. LEE, mine inspector, says that in a good many Colorado mines the employers insure their men against accident, apparently deducting the cost from their wages. Men also frequently insure themselves. (233.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, states that that company makes insurance a condition of employment. This has always been done, and the men have never complained. There is a notice posted about the works that such and such deduction will be made for hospital dues and insurance dues, and the men enter into a contract to this effect before they are employed. The company is saved from liability; the Employers' Liability Association takes the risk of any action for damages about the works. The witness believes that the deduction for insurance is 65 cents or \$1 per month; the hospital dues are 65 cents per month. This money pays the company doctor, whose duty it is to attend the men and their families. (298, 303.)

Mr. WRIGHT states that the American Smelting and Refining Company does not impose any restrictions as to insurance upon its men at its Denver smelters. (307.)

Utah.—Mr. HANAUER, who is interested in smelters and metal mines in Utah, states that it is the custom in his establishments for the men to contribute \$1 per month either toward hospital service or toward accident insurance. They take their choice between the two, and they are not obliged to take either. A man who should refuse would not be prejudiced in respect to his employment. It seems to be the universal practice to take one or the other. Mr. Hanauer estimates that 90 per cent of the men take accident insurance and not over 10 per cent the hospital service. His company has an insurance which relieves it from responsibility in case of accident; it is not clear whether or not this is paid for by the contributions of the men. (608, 609.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, says that that company had a system of involuntary insurance at one time, but it became obnoxious and was given up. Under a purely voluntary system, with low premiums and good indemnities, 90 per cent of the men went in again. (595.)

Mr. CHAMBERS, mine operator, states that it is not customary in Utah, so far as he knows, to compel the men to pay for accident insurance. The companies sometimes contract for insurance without expense to the men. Some accident companies also do a considerable business with the miners individually. (585.)

Mr. ALLEN states that there is no system of insurance under his company, and he does not know whether there is one at any mine in Utah. (572.)

Idaho.—Mr. BURBRIDGE says that most of the mining companies in Idaho insure their men against accident. This does not relieve the company from liability for damage suits. (459.)

6. *Employers' liability.*—Mr. SMITH thinks that a rigid employers' liability law is especially desirable in Colorado. The existing law does not protect employees against injury by the negligence of fellow-servants. So long as this is true the workingman ought to be allowed to have some influence in selecting those with whom he is compelled to work, and this influence he does not secure. (226, 227.)

J. Miscellaneous testimony as to condition of labor in mountain States.—1. *Immigration. Foreign-born labor.*—Mr. SMITH, deputy labor commissioner of Colorado, believes that the tendency of immigration is to produce an excess of labor and depreciate wages. He believes it would be advisable to restrict immigration to those who possess a small amount of wealth and who are able to read and write English. There are comparatively few foreign-born persons in Colorado who can not speak English. There are a good many Swedes and some Italians. The latter are very clannish and are not a desirable class of citizens. (221, 222.)

Mr. THOMAS, State coal-mine inspector of Utah, says that the coal miners are mostly foreigners. Italians, Finlanders, and French predominate. There are also Welsh, English, and some Americans. (626.)

Mr. HANAVER, of Utah, says that the Finlander makes the best miner of all. There are many Scandinavians, some Irishmen, Cornishmen, and Italians, in his employment. (611.)

Mr. CHAMBERS states that in his mine at Park City, Utah, the miners are a mixture of nationalities, in which the Irish-Americans probably predominate and Scandinavians are next in number. Mr. Chambers prefers American miners, if he could get enough of them. (588.)

Mr. ALLEN states that the majority of the men at his mine near Salt Lake City are English speaking—Americans, English, Scotch, and Irish. There are also Scandinavians and Finns. It is the general purpose not to have any one nationality predominate, unless it is the Americans. (572.)

Foreign labor in smelting.—Mr. HILL, of the Argo smelter, Denver, states that that company employs very largely foreigners, probably more Swedes than any others. It has always been the policy of his company not to employ too many of any one class, in order to avoid clannishness. He has found American workmen preferable to foreign for the more skilled parts of the work. (377.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, says that the blast furnacemen are generally American born. Around the roasting department they are Austrians, Italians, and a very few Americans. The foreigners seem better adapted to that class of work. The witness has not found colored labor very satisfactory, on account of a lack of ability for continuous work. (296.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, states that in that smelter the Scandinavians probably predominated. There were Germans, Irishmen, Englishmen, Welshmen, and native Americans. (595.)

Mr. WRIGHT, of the smeltermen's union, says that he thinks about one-third of the men in the Colorado smelters are foreigners. They are largely Swedes, Austrians, and Scandinavians. The foreigners need some restraint when there is any trouble, but in times of peace they are as fine workmen as are to be had. They are improving and learning to be good citizens. The Swedes especially are anxious to become citizens and educate themselves. (313.)

2. *Importation of labor. Contract labor.*—Mr. COATES, of the Federation of Labor of Colorado, says that the Colorado Fuel and Iron Company has imported a large number of negroes from the Southern States, under contract, into their works in the city of Pueblo. There was also a large importation from Missouri under contract during the Leadville trouble in 1896. Attempts were made to the same end in the Northern coal strikes in 1898. He does not think there is any State law prohibiting importation of labor. He regards such importation as detrimental to the State, and especially to the men who are displaced, who may have been employed many years and may have built homes which they have supposed to be permanent. The laborers imported are usually of a low and ignorant class, and Mr. Coates's own county is to-day under great expense in the way of criminal prosecutions and public charity as a result of the importation of laborers. Such importations have a tendency to reduce wages, and the employers nearly always make provision for the displacing of organized labor. He believes that the companies find their best method of importing laborers to be by sending personal representatives to the districts where men can be found. The laborers are induced to come by various misrepresentations, and especially by

assurances of permanent employment, which are disregarded when the interests of the company demand it. As a rule, such laborers are not English speaking. Few English-speaking people will make a contract to take someone else's job. In consequence of the agitation against foreign importation large companies now go to the Southern States and get negroes. A law ought to be passed to prevent companies from importing men to take the place of strikers. Mr. Coates would not, however, favor a law to prevent anyone from voluntarily coming into the State. (248, 249, 257.)

Mr. CLARK, of the Western Federation of Miners, states that he has known of only one case in which men have been brought under contract from other States to the coal mines of Colorado to break a strike. In that case the strikers sent men to Denver and stationed some at the station there, and had others visit the boarding houses and lodging houses to persuade men not to go to the mines where the strike was. In some cases men who came to the mines and were persuaded to return were sent home at the expense of the union. Mr. Clark thinks there ought to be a law forbidding any company to bring laborers from another State to take the place of men out on a strike. (328, 329.)

Mr. GRANT says that the importation of miners from other States is a somewhat frequent method of meeting strikes in the precious-metal mines. Men have been imported from Missouri at times for this purpose. (197.)

Mr. SMITH, deputy commissioner of labor, refers to the importation of labor from Missouri and other States in connection with the strikes at Leadville. He says that the men imported were "the worst lot of all-around thugs" that ever came in a body to Colorado, and yet a militia company was organized for the purpose of protecting them from interference. He thinks laws prohibiting such practices desirable. Mr. Smith also says that recently a considerable number of colored laborers have been imported to work in the Colorado Iron Works at Pueblo. (215, 222.)

Mr. SULLIVAN, a metal miner of Colorado, says that numbers of people have been brought into that State under contract, when there were a large number of unemployed in the State looking for work. He thinks that it should be forbidden to carry labor under contract from one State to another, or from one part of the State to another. (351, 356.)

Mr. WRIGHT, of the Smeltermen's Union, does not know that the Colorado smelters have ever brought in any labor under contract. There have been temporary scarcities of labor, lasting only through the hot season, and at such times the smelters have sometimes made contracts with local employment agencies. (313.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that his company has never introduced labor into its Pueblo plant from other States. It did take Italian labor from New York to its Mexican plants at one time, but has ceased to do so. It has found the Mexican labor preferable. (297, 304.)

Mr. HAMMOND, secretary of state of Utah, says that that State has no law prohibiting the bringing of foreign labor under contract from other States, but that nothing of the kind has occurred, to his knowledge. (620.)

Mr. ALLEN, mine operator, has never known of the bringing of any labor into Utah under contract, either from abroad or from other States. (569.)

3. *Colored labor.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that of its 7,500 employees probably 500 are colored. They were brought from the South. They are employed both at the steel works and at the mines. They are less given to strikes than white laborers and not so subject to agitation, and are fully equal to white labor in endurance and steadiness of work. For the most part they are common laborers. In some places the work is hot, and colored men probably stand the heat better than white.

Japanese are now being employed in Idaho. The witness has found non-English-speaking men less desirable than those who speak English, being less intelligent, more vicious and clannish, and more easily led into violence. (270-272, 281.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, does not know that any colored labor has ever been brought to the Colorado smelters under contract. He has known of only one trial of colored labor at a smelter. The Globe Smelter put in 60 colored men one morning, and at night only 4, Mr. Wright believes, were left. At the end of the week the colored men had all quit. They said they could not stand the heat. Mr. Wright's opinion is that the labor is too continuous for them. There is no prejudice against colored men at the smelters, and if they were employed there they would be received into the union. (313, 318.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, states that that company has not tried colored labor very much, and has not liked what it has tried because of a lack of ability for continuous work. (296.)

Mr. HILL states that the Argo smelter, Denver, does not employ any colored labor. (377.)

Mr. HANAUER, of Utah, says that he has not employed any colored labor in his mines or smelters. (611.)

Mr. ALLEN states that there is no colored labor at his mine near Salt Lake City. (572.)

4. *Employment of children.*—Mr. COATES, of the Colorado Federation of Labor, says that the legislature of Colorado in 1899 passed a law forbidding children to go to work before reaching the age of 14, but industrial conditions are such that public sentiment allows the law to be evaded. Many people—widows—are dependent upon their children for support. Public sentiment sustains the allowing of such children to go to work because parents and children would otherwise become the subjects of charity. Mr. Coates thinks it is the business of the school directors to enforce the law, but says that in his own school district the directors know of many instances where the law is violated, and he thinks they pay little attention to it. He knows of no instance where the law has been enforced except through the efforts of organized labor; and even organized labor has almost been obliged to desist because of hostile public sentiment. (258.)

Mr. SMITH, deputy commissioner of labor, says that there is a law in Colorado compelling the attendance of children upon schools at least 14 weeks in each year. He does not think that further legislation is especially necessary. The employment of children generally is injurious to adult labor. In many cases a boy of 12 or 14 can run a machine as well as a grown man, thus depriving the latter of employment. (220, 226.)

Mr. SULLIVAN, a metal miner of Colorado, states that the social and intellectual condition of the workers is improved by the law which prevents the employment of children in mines and factories. He would raise the age of employment to 18 years. He would not make any exception even in the case of a widow with a family of small children and a boy or two of the age of 15, 16, or 17. The State should look after people in such circumstances. (353.)

Mr. CLARK, of the Western Federation of Miners, states that some children are employed in the mines as trap boys, and some boys go in and work with their fathers, he thinks, as young as 13 years. He considers that the effects of employing boys of that age are bad. (333.)

Mr. ALLEN states that no children are employed in the metal mines of Utah. He does not know as to the coal mines. (571.)

5. *Machinery.*—*Precious metal mines.*—Mr. GRANT says that constant improvements are being made in mining machinery. The only machine that would tend to displace labor is the drilling machine, but the witness thinks that as a matter of fact few laborers have been displaced. (198.)

Mr. CHAMBERS, a mine manager, says that the introduction of machinery has diminished the number of men in particular metal mines, but does not, he thinks, diminish the number of men employed upon the whole. Mines are worked and employ labor which could not be worked at all without machinery. (580.)

Mr. HILL believes that improved machinery benefits the laboring class in the long run. He has not seen any detrimental effect on the laborer from improved machinery in mining or smelting. (375.)

Coal mines.—Mr. BEAMAN states that the Colorado Fuel and Iron Company does not employ machinery in its mines. It tried some machines, but did not find them satisfactory. (265, 266.)

Mr. CLARK, of the Western Federation of Miners, states that the introduction of mining machines in northern Colorado, by making it possible to produce a great deal of coal in a short time, has cut down the average number of working days in the year. He estimates that the machines have thrown out of work one-third of the men formerly employed there. That number of men, he thinks, have left the region, or at least the mines. (332, 333.)

Mr. Clark states also that a man mining coal with a pick will not make so much slack by 20 per cent as a mining machine. (332.)

Smelters.—Mr. WRIGHT, of the executive board of the Smeltermen's Union, says that no considerable amount of new machinery has been introduced into the smelters in recent years except in the way of enlarging the capacity. The use of electricity has been increased. The output has been largely increased in proportion to the number of men employed. "There used to be 30 men on 10 furnaces, and now we are treating more ore in the same department with 18 men." Formerly the men had to go in and tap the furnaces about every fifteen minutes; now they have to go in every three or four minutes. The severity of the work has therefore been very much increased, and the men are more constantly exposed to the furnace fumes. (314, 319.)

6. *Social condition of labor.*—*Colorado.*—Mr. COATES, of the Colorado Federation of Labor, says that the social condition of workmen in Colorado is bettering as they organize. There is a continual improvement where the men are brought together. The trade unions generally have public meetings, say once a month, for educational purposes. They also have libraries and reading rooms, which they support; and generally their social condition and intelligence are improving. (252.)

Mr. SULLIVAN, a metal miner of Colorado, thinks that the social condition of his associates is better than it was 20 years ago, largely through the influence of the labor organizations. The men do more reading and a little more thinking. The school facilities have improved. (353.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, thinks that the social condition of the smelter men and the miners of Colorado is improving. He thinks they are more inclined to save money than they were 15 years ago, and that they read more and educate themselves and their families more. He has seen no great change in respect of drinking. Not many of the smelter men are hard drinkers; their health will not permit them to drink much. (312.)

Mr. CLARK, of the Western Federation of Miners, states that the standard of living of the coal miners of northern Colorado is much worse than it was 10 years ago. The reason is a decrease in the number of days in the year that they are able to get work, and this is caused largely by the introduction of machinery. (332.)

Mr. HILL, mine and smelter operator, believes that the miners of Colorado generally are as well off as they have ever been. They used to receive very much higher wages, but the cost of everything that they had to consume was very much higher. Mr. Hill implies that this higher cost would scarcely cover the difference in wages, saying that the very high wages led to certain kinds of extravagances that have gradually disappeared. In a recent visit to his old town of Blackhawk he has observed an air of thrift and a number of well-kept homes, which seem to indicate better social conditions among the miners than existed 20 years ago. (380.)

In Colorado, according to Mr. LEE, mine inspector, the men working in the mines 20 years ago were of a higher average intelligence than at present. Many of them were college men trying to make a fortune. At present a large proportion of the employees show little ambition to rise above ordinary wages. Nevertheless, there are much better social opportunities and opportunity for personal improvement now than formerly. (233.)

7. *Social condition of miners and smelters.*—*Utah.*—Mr. TERHUNE says that the intellectual, social, and moral conditions of the miners and smelter men of Utah are improving. He attributes the improvement to the entrance of their children into the public schools; to the cheaper price of literature, and to their increased leisure for intellectual pursuits. (592.)

Mr. CHAMBERS, mine operator, thinks that the moral and social condition of miners in Utah has improved very much in 15 years. This is largely due to the fact that the mining districts of the State are now settled by a more substantial and moral class of men than most new districts. It is also due in part to the establishment of the common-school system and churches. (585.)

Mr. ALLEN, mine operator, thinks that the social and intellectual condition of the miners in Utah is improving. The population of the mining camps was of a less thrifty class in the early history of the State, but there has been no marked change in the last 10 years. (576.)

Mr. CALLIS, county attorney of Summit County and formerly a coal miner, thinks that the social and intellectual condition of the coal-mine workers is much better than it was 10 or 15 years ago. He attributes this especially to the 8-hour law, which has given the miners more time to study and inform themselves. Literature is also more abundant and more newspapers are taken. The miners whom he has worked with are sober, steady, industrious, and economical. They have an increasing tendency to settle down and have homes of their own. (631.)

Mr. THOMAS, State coal-mine inspector of Utah, says that the social and intellectual condition of coal miners is better, in his judgment, than 20 years ago. He attributes the improvement largely to the greater leisure for mental improvement, due to the shortening of hours of labor. (626.)

Mr. SHARP states that the social and intellectual condition of the miners of the Pleasant Valley Coal Company is about the same as it was 10 years ago. There is some inclination among the men to read and try to improve their intellectual status. The Knights of Pythias have a lodge and a library at one of the company's mines. (640.)

8. *Farmers as miners.*—Mr. SHARP, superintendent of the Pleasant Valley Coal Company, says that perhaps 25 or 30 per cent of its men work on farms, generally their own, during three or four months in the summer. They are generally more

expert at mining than at farming, yet Mr. Sharp believes that many of them would go away during the summer, even if the mine were working. The number of men of this class is perhaps greater in Utah than in Colorado or Wyoming. (642, 643.)

Mr. ALLEN states that though many of the men in the Centennial Eureka mine own little pieces of ground down in the settlement, they are not themselves farmers. There may be men in other Utah mines who work a while upon their farms, then a while in the mines; but he has none. Such men would not be skilled miners. (577.)

Mr. CHAMBERS states that in his mine at Park City, Utah, men frequently work for a time and then work for a time on farms that they own. Such men are not fully skilled, and get lower wages than skilled miners. (586.)

Mr. THOMAS, State coal-mine inspector of Utah, says that a considerable number of farmers come to the mines to work during the winter. He believes this tends to maintain the harmonious relations between miners and mine owners. (627.)

9. *Ownership of homes. Rents. Expenses.*—Mr. Thomas, State coal-mine inspector of Utah, says that about one-third of the Utah coal miners own their homes. He considers the effect of home owning to be valuable in making better citizens and in discouraging intoxication and extravagance. (626.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Salt Lake City, states that there was an increased tendency among the employees of that company to own their homes, and it was a tendency which he believed to be very desirable. (595.)

Mr. WRIGHT states that the workmen in the Denver smelters pay from \$4 to \$12 a month for dwellings. He would consider \$8 the average. Rents have recently risen so that houses which could have been got 6 months earlier for \$4 or \$5 per month cost \$6 to \$8. Ten dollars is paid for a little 5-room cottage. (308, 310.)

Mr. Wright states that the majority of the men in the Denver smelters are men of families, and he estimates that their families would average about five. He thinks their grocery bills would average \$18 to \$20 per month. They have to buy the cheapest clothes they can. Mr. Wright has to buy about a suit every month, which costs from \$2.50 to \$3. The cost of living has recently been increased by reason of the general rise of prices. Clothing bills, medical bills, and incidental expenses, including rent, will consume about three-fourths of the income of the smelter workmen. Mr. Wright has never known any of the smelter men to save anything, although they are very economical. They necessarily use somewhat expensive food, because of the effects of the furnace fumes upon their health and the need of humoring their stomachs. They have to have much meat, and some variety of food. (308-310, 319.)

10. *Character of workingmen. Savings.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that the miners employed by that company are an average class of men, some thrifty and some not. Their habits do not differ much from those of the population as a whole. They include Italians, Austrians, Hungarians, colored men, and white Americans. At the steel works the men are mostly Americans, white and colored. (270-272, 289.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that the workmen are not generally inclined to save their money and build homes. A large proportion of the men are unmarried and live in boarding houses. The Americans spend their money on their families or spend it in the saloons. The foreign element are more likely to save money and send a part of it to the old country. (295, 296.)

11. *Marital condition.*—Mr. THOMAS, State coal-mine inspector of Utah, says that about two-thirds of the Utah coal miners have families. (626.)

Mr. CHAMBERS, mine operator, Utah, states that the majority of the miners that he has to do with have families. Most of them try to get permanent homes outside of a mining camp, preferably in the valleys. (585.)

Mr. TERHUNE, recently manager of the Hanauer smelter, Utah, states that 90 per cent of the men employed by that smelter are married men. He believes that the men who have families and homes are more interested in their work than others. The company gave preference to married men. (595.)

12. *Unskilled labor.*—Mr. COATES says that unskilled laborers compose the great mass of the unorganized, but that organized labor has in many instances effected great improvements in their condition. Very few statutes in favor of the laboring man have been passed in Colorado, except through the efforts of organized labor. Instances are the 8-hour law and the \$2 pay for common labor. Few of the unskilled laborers in Colorado are English speaking; the great mass are Austrians, Swedes, and Italians. As they become skilled and familiar with our language and customs they incline more toward organization. A number of unions have recently been formed, of whose members perhaps 90 per cent are of foreign speech. (246.)

III. THE CŒUR D'ALENE STRIKE AND RIOT OF 1899.

(Testimony taken in Idaho in July, 1899.)

A. General statements as to conditions in Cœur d'Alene district.—

Mr. BURBIDGE, assistant manager of the Bunker Hill and Sullivan Mining and Concentrating Company, testifies that the company is incorporated under the laws of Oregon with a capital of \$3,000,000. The stock of the company is not watered. The officers of the Standard Oil Company are not interested in the mining company. The company has been in operation about 13 years, and during that time has paid dividends of a little over \$600,000, being less than 2 per cent per annum on the capital stock. Meantime perhaps an equal sum, taken from earnings, has been spent in improvements. The mine is a large one, having a long life before it, and it was necessary to make comprehensive plans. The reduction in the cost of handling ore has increased the profitability of the mine during recent years. (438, 439.)

Mr. FRICH, of the Standard mine, says that the Standard Oil Company has no interest in that mine, nor, so far as he is aware, in the Bunker Hill or any other mine in the Cœur d'Alene region. He has been told this especially by the president of the Bunker Hill Company. (500, 505.)

Mr. GILL, master mechanic of the Tiger and Poorman mine, believes that the Standard Oil Company has no considerable interest in the Bunker Hill and Sullivan mine, although it may own a little stock. The mine is owned chiefly by D. O. Mills and Crocker, of San Francisco, and McCormick, of Chicago. (524.)

Mr. SOVEREIGN, editor of the Idaho State Tribune, says that it had been the general report among business men and miners alike that the Bunker Hill mine was practically the property of the Standard Oil Company, although the witness has no authentic information to prove that fact. However, the interest of the Standard Oil Company did not raise any particular animosity against the mine. The witness does not doubt the truth of the statement of other witnesses that the Standard Oil Company has now no interest in the Bunker Hill property, but points out that mining stocks are changing hands rapidly all the time. (406.)

B. Causes of strike at Bunker Hill and Sullivan mine.—The findings of the coroner's jury in the inquisition upon the bodies of the men killed on April 29, 1899, describe the events leading up to the strike against the Bunker Hill and Sullivan Company and the consequent riot. Descriptions of these events, tallying with these findings practically in every particular, are also given by Mr. Burbidge assistant manager of the Bunker Hill mine, and by Dr. France, coroner, and physician of the Bunker Hill Company. The description given by the coroner's jury is chiefly followed below. (441, 442, 462, 465, 466.)

In 1894 the wages in the Wardner mines, including the Bunker Hill mine and the Last Chance, were fixed at \$3 per day for underground laborers and \$3.50 for miners. Union and nonunion men were employed without discrimination. In November, 1894, the miners' union of Wardner demanded that laborers, including muckers and carmen, should also be paid \$3.50 per day. The company refused, and the mine was shut down until June, 1895. At that time many of the miners, especially nonunion men, and business men of Wardner petitioned for opening the mine. The market conditions being unfavorable, the company agreed to start with the understanding that \$2.50 per day should be paid to laborers and \$3 to miners, and that whenever the price of lead and silver should be such that 100 pounds of lead and 2½ ounces of silver should together have a market value of \$6, the old rate of wages should be restored—a condition never yet reached. On account of the opposition of the unions and the impossibility of continuing to work union and nonunion men together, the company decided to employ only nonunion men. Mr. Burbidge adds that the union tried to keep men from taking employment, but after a time a full crew was secured.

Mr. Doud, county tax assessor, says that during the year 1893 there was some difficulty between the Bunker Hill and Sullivan Company and its employees. The company made a proposition to the Knights of Labor, the only union then existing at Wardner, to pay wages at a certain scale, subject to increase if the combined market price of lead and silver should rise, or, as an alternative, to pay the existing rate of \$3 for laborers and \$3.50 for miners, but with no understanding that those rates could be continued for any length of time. Both these propositions were rejected by the Knights of Labor, and another was then submitted to the effect that the company would pay \$3 and \$3.50, respectively; that it would give preference to the members of the organization in employment, and would not compel them to board at the company boarding house. This proposition was accepted, and everything seemed harmonious until the fall of 1894, when it was learned by the Knights of Labor that

the Bunker Hill Company was importing miners from Michigan, and even Italians from Castle Garden. The miners appointed a committee to request the company to stop this practice, but the company, after some discussion, declared that it proposed to run its mine with the same policy in the future as in the past. The men thereupon voted to quit employment until the company should recognize the agreement which had been made with regard to the organization. The mine accordingly remained shut down until June, 1895. At that time the company, so the witness declares, circulated a petition for the opening of the mine, on the understanding that when the price of 100 pounds of lead and 2½ ounces of silver should reach \$6, wages would be raised to \$3 and \$3.50, the rates meantime to be \$2.50 and \$3 per day. This petition was signed chiefly by store men and outsiders; the miners were not consulted at all. The witness is satisfied that the price of lead and silver afterwards reached the figure mentioned, but that there was no increase in wages.

Mr. Doud declares further that just before the riot of April 29 he went in company with Mr. Young, the sheriff, to consult with Mr. Burbidge, manager of the Bunker Hill and Sullivan mine. The witness urged Mr. Burbidge to meet the men and settle the difficulty peaceably, but he declared that there was nothing to settle. Mr. Burbidge admitted he had discharged many men simply because they belonged to the union; and on having his attention called to the law of 1893 prohibiting the discharge of men on that ground he declared that he had taken legal advice concerning his action. (540-543.)

Mr. SOVEREIGN, editor of the Idaho State Tribune, declares that the value of ore had risen above the figure agreed upon as the basis for higher wages in the arrangement of 1895, and that the company positively refused to increase the wages and repudiated its contract. He says that the men then began to organize, but were discharged as rapidly as their membership in the union was ascertained. The governor, Mr. Sovereign has been informed, asked the company to arbitrate the difference, but it refused to do so. After the situation had become much strained, an increase in wages was granted (in April, 1899), but not quite up to the union rate. (393.)

Dr. MACHETTE blames the Bunker Hill company for the strike and the difficulties. The company would not recognize the union, would not hire the doctor the men wanted, and wanted the men to trade at certain stores. The company has not run a store of its own for some time, but has a boarding house of its own. The witness thinks it is the cheapest mine to work in in the whole region. As soon as men would join the union they were discharged, and ill feeling has been steadily growing. The witness does not think that the unions are lawless organizations, although there are some bad men in them. The membership as a whole, he thinks, deprecated the commission of any crime. (436-438.)

Mr. BURBIDGE admits that after 1895 the Bunker Hill mine refused to employ union men, although a few union men, who made no difficulty, were perhaps employed. It was not required that the workers sign any paper further than that required by the law of Idaho, which provides that mines may employ only American citizens or those who have declared their intention of becoming such. In support of this statement the witness submitted a copy of the form of application for employment used. (441, 453.)

Mr. SOVEREIGN and Mr. GILLEN (a miner of the Gem mine) both refer to the fact that the Bunker Hill mine required those seeking employment to sign a statement that they did not belong to unions and would not join them. (425.)

Dr. FRANCE testifies that since May, 1892, he has been physician and surgeon of the Bunker Hill Mining Company. He is paid by the men under an agreement by which \$1 per month is deducted from the wages of each. He maintains a private hospital in connection with this work. (462.)

Mr. BURBIDGE says that the doctor who cares for the employees of the Bunker Hill mine is selected by the men and paid by them through an assessment of \$1 per month. It is necessary that there should be a considerable number paying one doctor in order to justify him in maintaining a hospital. But there is no objection when the men desire another doctor to treat them individually, and they can direct their dollar to be paid to any doctor. (460, 461.)

Reason for lower wages at Bunker Hill mine.—Mr. BURBIDGE insists that differences in conditions justified lower wages at Wardner than in the mines of Canyon Creek. In fact the wages at the other mine at Wardner, the Last Chance, which employs only union labor, have always been the same as at the Bunker Hill mine, the miners' unions making concessions and not demanding that the same wages be paid as in other mines. The Wardner mines are operated through tunnels and have good drainage and ventilation, while those on Canyon Creek are shaft mines, and are wet and badly ventilated. Board at Wardner is \$6 per week, and on Canyon Creek \$7 per week. The Wardner mines are less profitable, also. The ore is not rich even in

lead, and the proportion of silver is much less. The cost of getting out a ton of ore is higher in the Bunker Hill mine than on Canyon Creek. About one-third of the material broken is waste, aside from the fact that the ore occurs in separate bodies or chutes, making long drifts through unproductive material necessary. On account of the thickness of the vein in the Wardner mines, heavy timbering and filling are necessary.

The cost of removing water from the Canyon Creek mines is, the witness admits, greater, but the Bunker Hill mine has to expend large sums in running tunnels, much more than the other mines spend on shafts. It costs less to deliver the ore to the mill on Canyon Creek than at the Bunker Hill mine, where the concentrator is about 2 miles from the mine.

As a matter of fact the employees of the Bunker Hill have been generally satisfied with their condition. There was no complaint among them, so far as Mr. Burbidge knows up to April 23, 1899. The witness thinks that the origin of the difficulty was with the miners on Canyon Creek, who affected to believe that the companies there would be influenced to reduce wages to the same scale as at the Bunker Hill mine. A mine with a lower grade of products can not, as a general thing, pay quite as high wages as mines with higher grades of ore, but nevertheless the miners at the Bunker Hill mine are, on the whole, better off than any others in the district. The question of wages at the mine could not be arbitrated. (440, 450, 455.)

Mr. MacDONALD, manager of the Helena-Frisco mine, also declares that it is easier to work in the Bunker Hill mine than in those on Canyon Creek. The Canyon mines are wet and the men have to pay about \$15 every month for rubber clothes, which are not necessary at the Bunker Hill mine. The cheaper board at the Bunker Hill mine also justifies lower wages. Moreover, the cost of producing ore in the latter mine is considerably greater than in the Helena-Frisco mine. (482.)

C. The riot of April 29, 1899.—1. *Events immediately preceding riot.*—The report of the coroner's jury continues that early in April, 1899, the presence of agitators at Wardner and the attempt to unionize the men in the Bunker Hill mine forced the Bunker Hill company to investigate its rolls and have a number of union men summarily dismissed. This precipitated the later troubles. On April 23 a meeting of the Wardner union was held and committees were appointed to wait on the Bunker Hill and Last Chance mines, and to demand \$3.50 for all underground workers and recognition of the Union. Mr. Burbidge adds that only about 5 out of the 20 men composing the committee which waited on him were employees of the Bunker Hill mine. The report continues that the assistant manager promised to communicate this proposal to the company, although he declared that he would not recognize the union. A second meeting of the Wardner union was held on the same day, and a strike was declared in both mines, and the entire body of the union was ordered to march to the Bunker Hill mine, where a demonstration was made and the nonunion men were solicited to join the union. Mr. Burch, superintendent of the Bunker Hill mine, then announced that wages would be raised to \$3 and \$3.50, but that men joining the union would be discharged.

On the following day and again on Wednesday, April 26, the Wardner union marched in force to the mine, some of the members armed, and again demanded that the nonunion men should join the union. Force and intimidation were used, and a number of Bunker Hill men did join the union. Some of these afterwards returned to the mine, and as a matter of fact the strike had effectually failed. Work was resumed until April 29. (466.)

Mr. BURBIDGE, assistant manager of the Bunker Hill mine, states substantially the same facts as those presented by the coroner's jury. In addition he says that on April 26, as the employees of the Bunker Hill mine were on their way to work in the morning, they were stopped by an armed mob of 150 men and given 4 minutes in which to get back; they accordingly retreated. At the same time the union mob captured the tramway of the mine and tied it up, although it was left uninjured. Warnings were constantly being received that the union intended to destroy the company's property. Nevertheless part, at least, of the nonunion men continued to work in the mines and at the mill up to the day of the riot, April 29. (441, 442.)

Dr. FRANCE, coroner, testifies that on the morning of April 26 he saw a large body of men, probably 200, enter the Last Chance mill at Wardner. They were intending to stop the nonunion men from going to work at the Bunker Hill and Sullivan mine. The witness saw a half a dozen union men rush into the mine boarding house and come out dragging nonunion men by the collar and kicking them. Dr. France, as a county officer, threatened to arrest one of these union men, but the man struck at him and ordered him to go away. The nonunion men did not go to work that morning, but did so in the evening. (463.)

2. *Action of miners' unions.*—The findings of the coroner's jury declare that the Burke miners' union had passed a resolution, before April 29, that it would, as a union, render assistance to the Wardner union in the pending strike. On the morning of April 29 orders were issued that the members of the union should proceed in a body to Wardner. The miners took the Northern Pacific train, and when they arrived at Gem they broke open the powder house of the Helena and Frisco mine and seized 80 boxes of dynamite, each containing 50 pounds. On the night of April 28 masked men demanded that the president of the Gem union call a meeting in the morning. At that meeting, the hall being darkened, a large number of guns were produced from the rostrum of the union hall, masks were put on, and the union marched in a body to the train. At a meeting of the Mullan union, held on the morning of April 29, a resolution was adopted to proceed to Wardner and give moral support to the Wardner union, but it was decided not to mask. On the march to Wallace a large number of rifles were taken by the Mullan men from a field where they had been cached. The Wardner union issued orders on the night of April 28 that all members should go to meet the train at the Kellogg station. (467, 468.)

Mr. SINCLAIR, State auditor of Idaho, insists that the miners' unions of the Cœur d'Alene district have shown themselves to be criminal organizations. Whatever may be the terms of their constitutions or the declarations of some of their members, the actions of these bodies show conclusively their character. The witness refers especially to the proof concerning these actions in regard to the riot of April 29, brought out in the testimony of the Corcoran murder trial. (547.) It was shown in that case that resolutions were passed by the unions to meet together and go together on their lawless mission. The men received their arms and masks in the union hall. This appears from testimony of the members of the unions themselves. Although not all of the 1,000 or 1,200 men who were present at the destruction of the property knew of the intention, Mr. Sinclair believes that between 300 and 400 ought to be convicted of murder in one degree or another, or of arson, and, perhaps, 700 of conspiracy.

Mr. Sinclair says also that so far as he knows not one member of the miners' unions has condemned the outrage, but, on the contrary, hundreds have expressed to the witness their approval of it.

This witness does not believe that the Western Federation of Miners, with which the miners' unions of the Cœur d'Alene district are affiliated, approved of the action of the local unions or knew anything of it in advance. He is not willing to characterize the Western Federation as a criminal organization. (547, 554, 562.)

Dr. FRANCE admits that there are probably a good many members of the miners' unions who did not and do not now approve of the riot of April 29, and that the unions were probably not organized with criminal intent. But they were, at the time of the riot, controlled by criminals, and it is known from sworn evidence of members of the unions that criminal action was taken in the miners' meetings themselves, as shown by the report of the coroner's jury. These actions were taken in the halls of the unions. It was the understanding of those who drew up the governor's proclamation concerning unions that these unions were responsible for the crimes of April 29. (477, 478.)

Mr. FINCH, a mine operator, thinks that comparatively few of the men who were on the train going to Wardner knew what was the purpose of the leaders. He believes the majority of them disapproved the act, and would have remained away if they had known what was going to be the result. They were, however, ordered to go and dared not refuse. No public disapproval has yet been expressed by the unions against the riot, although the witness thinks that the unions' paper, the Tribune, has repeatedly denounced it. (493-498.)

Mr. SOVEREIGN, editor of the Idaho State Tribune, specifically denies that any evidence can be produced to show that the unions of the Cœur d'Alene district officially authorized or counseled the acts of violence on April 29, or even discussed them. The witness was present at the Gem union on April 28, and the ordinary business only was carried on, except that the witness himself made a short talk as to the possibility of unionizing men at the Bunker Hill mine. Mr. Sovereign says, further, that the records of the Burke union have been confiscated by the troops, and if there were anything in them showing a criminal intention it certainly would have been made public. (402, 403.)

Mr. GILLEN, a member of the Gem union, also says that there was no action looking toward lawlessness taken while he was present at the union during the two or three meetings previous to this trouble. He was not, however, present throughout the entire meeting in either case, but he understands that the only action taken was to declare that the union would give its moral and financial support to the strike at Wardner. (421.)

Mr. GANN, a carpenter and miner, declares that no coercion was brought to bear to compel the men to go to Wardner on April 29. The witness thinks there was no plan of action formed until the crowd actually got together. A large proportion of the men took no part in the violence. Many now consider the crimes very reprehensible, although the witness is not sure how the majority would stand on that matter. (487, 488.)

Mr. GILL, master mechanic of the Tiger-Poorman mine, believes that the riot of April 29 was not approved by the unions as such. Some hot-headed miners had recently come into the district, largely from Butte, and these controlled the movement. The witness was informed by members of the Burke union that no meeting of the union was held before the riot and no action taken regarding it. The witness is not a member of the union, but he has heard many members denounce the action of April 29. (521.)

Mr. YOUNG, ex-sheriff of Shoshone County, does not believe that the miners' unions countenanced or directed the riot of April 29. He has been told by many members of the unions that they did not know of the plan until the morning of that day and that no previous action had been taken by the unions. (536.)

3. *Seizure of train and trip to Wardner.*—Mr. MACDONALD, manager of the Helena-Frisco mine, testifies that he was at the office of the mine early on the morning of April 29. The mine superintendent told him that all but two men had gone to the miners' union hall. The superintendent went to the hall and reported that guns were being distributed. Mr. Culbertson, manager of another mine, was told by Paul Corcoran, secretary of the Burke union, that the men would simply go to Wardner and come back and return to work. Soon after, the Northern Pacific train came down from Burke crowded with men. The witness thinks there were at least 600 of them. Some were masked and many carried guns. They broke open the powder magazine of the Frisco mine and took out some giant powder. They shook their fists and their guns at the witness and his companions as they passed by on the train. Out of 240 men employed in the Helena-Frisco mine only 2 worked that day. On their return from the riot the men made no secret about what they had done. The witness denies positively that he had any connivance in the taking of the powder. (480, 481.)

Mr. HUTTON, the engineer of the train which brought the rioters from Burke to Wardner on April 29, testifies that about 200 or 250 men got on the train at Burke. Two masked men came into the cab of the engine and declared that they wanted the train to go right away. On the way down the engineer was poked in the back with a Winchester rifle and threatened with a pistol. He was compelled to stop at the Frisco powder house. The witness thinks that about the same number of men got on the train at Gem as at Burke, and about 200 or 250 also got on at the Y just above Wallace, having walked down from Mullan. The witness thinks that there were about 1,000 men on the train by the time it arrived at Wardner, of whom 175 or 200 were armed and masked. The witness recognized none of the masked men. Mr. Hutton was threatened with a pistol and compelled to run the train from Wallace to Wardner over the tracks of the O. R. and N. The regular run of the train was only from Burke to Wallace, and the great weight of the engine made danger that it would go through the bridges of the O. R. and N., while there was also danger of collision.

The witness declares that he was forced by threat of death to run the train as he did. If he had not obeyed the orders of the gang he believes that he would have been killed. The officers of the railroad have declared that they did not blame him for what he did. Nevertheless the witness was arrested and charged with conspiracy, although he was afterwards set at liberty without trial. (564-567.)

Mr. SOVEREIGN says that he was at Wallace at the time the train load of miners came down from Gem and Burke. He understands that the miners had loaded on about 80 boxes of dynamite at the Helena-Frisco magazine. It has been rumored that officers of other mining companies may be implicated in the matter, especially in permitting the use of this dynamite, but the witness knows nothing about it. The witness at first stated that there were probably 800 men on the train, but afterwards said that there may not have been more than 400. Some of them were masked and armed. The witness does not believe that more than one-third or one-fourth of the men knew anything about what was planned, and insists that no more than one-fourth of them participated in any act of violence. Most of them stayed on the train while the crimes were committed half a mile distant down the track. Mr. Sovereign went to Wardner on the next train, about 4 hours later, arriving there after the explosion. Many men were then standing on flat cars and box cars, and the shooting of guns was so incessant that the witness had to get back on the train again. Mr. Sovereign further believes that between 100 and 200 of the Bunker

Hill employees were armed, but that the assault was such a surprise that they retreated hastily. There had been no intimation at Wallace that anything unusual was going on until the train arrived from Burke. (393, 395, 398, 402.)

Mr. BARNARD, former mayor of Wallace, who saw the train on its way to Wardner from some distance away, states that he supposed there were probably 450 or 500 men on the train. All those whom he saw were armed and also masked. On the return of the train to Wallace a good many men got off there and walked through the streets, but the witness did not see any who were masked. There was no shooting or other violence around Wallace, and the police officer of the city took no action at that time. (412, 413.)

4. *Events at the Bunker Hill mill* (see also statement of sheriff, p. cvi).—The report of the coroner's jury states that the members of the various unions arriving by train or on foot from Wardner came together at Kellogg. After leaving the train the men were formed and marched to the Bunker Hill mine. A scouting party was sent around the foothills to command a view of the Bunker Hill mill. When the larger party came to the mill office they apparently mistook the scouting party for the employees of the Bunker Hill Company, and fired numerous volleys at the hill, killing a man named John Smith. Masked men then took the dynamite from the train and exploded it in the mill. The office and the boarding house were burned down. Before the explosion several employees of the Bunker Hill mine had been seized. The mob captured a number of the company's employees, abused and cursed them, and then told them to run. While they were running about 50 shots were fired at them. One, a stenographer, was slightly wounded, and another, James Cheyne, was wounded so that he died 3 days later. (467.)

After the explosion they were told to run, and numerous shots were fired at them. One of these shots hit James Cheyne, who afterwards died from its effects. One shot also grazed the lips of R. R. Rogers. (467.)

Mr. BURBIDGE says that early on April 29 an unsigned telegram was received by him to the effect that all the mines of Canyon Creek were closed, and that the men were coming in a body to Wardner. At first instructions were given to keep the Bunker Hill men at work, but soon after, on advice that the mob was armed and masked, the Bunker Hill employees were taken out of the mine. The witness then, fearing for his own safety, went away, and did not personally see the events which followed. He has understood that from 1,000 to 1,200 men were in the mob, of whom 150 or 200 were masked and armed. They doubtless expected resistance from the employees of the Bunker Hill mine, but they encountered none, and the witness declares that his employees had no arms. The mill was destroyed by dynamite and also all the other buildings except one. The loss was from \$200,000 to \$250,000. (442.)

Mr. BURBIDGE says that John Smith was a union man, and his death was either accidental or, as many thought, was intended because he was considered a traitor; this the witness thinks the probable reason. The mob next proposed to "clean out Wardner," but, changing their plans, they took the train on which they had come down and went away. (443.)

Dr. FRANCE says that, although he was not at the immediate scene of the riot, he was in Wardner, and was notified that his services were needed at the Bunker Hill mill for 2 men who had been shot. The train was just pulling out from the mill with the returning crowd. The witness examined the wound of James Cheyne, who died two or three days later. (463.)

Dr. MACHETTE, of Wardner, testifies that he went down to the railway junction at Kellogg with a deputy sheriff while the mob was at the Bunker Hill mill. A man with a mask told him that some one was shot, and he and the deputy started toward the Bunker Hill mill, but returned on being told that the man was dead. The witness believes that there were about 500 men in the mob, perhaps 100 or 150 being masked, and most of these armed. The witness is satisfied that most of the men went through curiosity, not knowing what was proposed. They all returned home promptly after the mill was blown up. (433.)

5. *Action of coroner's jury*.—Dr. FRANCE, coroner, says that soon after the murders of April 29 he was requested to go to Burke, whither the body of John Smith had been taken, and hold an inquest. Instead, Dr. France ordered that the body be brought back to Wardner, and on May 4 the inquest concerning the death of the two men was begun. Four hundred and eighty witnesses were examined and many persons connected with the murder were identified, some of whom were in custody at the time the witness testified and others not. (463, 464.)

Dr. FRANCE says further that the jury was composed of two or three miners and of the principal business men of Wardner. No one advised the witness in selecting any of these jurors. Although feeling was doubtless strong against the perpetrators of the crime, the witness thinks the jury was a fair and impartial one. (471.)

The chief conclusions of the coroner's jury are as follows:

"From the foregoing facts the following conclusions are irresistible:

"First. The killing of Schmidt and Cheyne was accomplished by an organized force, embracing the members of the 4 miners' unions hereinbefore named, acting as conspirators, engaged in the performance of unlawful acts, and each and every one of the members of said unions participating in, aiding, or abetting any of the unlawful acts of the 29th of April are legally and morally responsible for the unlawful killing of said Cheyne and Schmidt.

"It is beyond doubt true that the details of these crimes were skillfully planned and executed under and by authority of the central executive committee, or union, composed of delegates from each of the participating unions, and under the sanction of the Western Federation of Miners.

"The reign of terror which has existed in the Cœur d'Alenes for a great many years is due exclusively to the preaching and practice of such doctrines. So far as the immediate cause of this inquest—the murders of Schmidt and Cheyne—is concerned, we find that the said miners' unions, although seeming to have been organized for the laudable purpose of defending the rights of labor, have acted as unions in the violation of the law of their country, and in perpetrating crime against the laws of the State.

"We charge the murders of said Schmidt and Cheyne to have been perpetrated by the said miners' unions and their respective members who were present and participated in any of the deeds of that day. Said miners' unions and their members aforesaid were aided, abetted, and assisted by the said Sheriff Young and Moses S. Simmons, William Boyle, and W. R. Stimson, county commissioners." (467-471.)

6. *Prosecution of criminals.*—Dr. FRANCE refers to the fact that Paul Corcoran had just been convicted of murder in the second degree in connection with the riot at Wardner. This man was secretary of the Burke union and had taken the body of John Smith to Burke after the riot. The witness refers to the charge that undue influence was exercised upon miners to compel them to testify in the suit against Corcoran. He says that there has been no proof of such undue influence. The witnesses were of course brought to the trial under guard, since they themselves were persons suspected of crime. In many cases, if not in all, they were instructed by the State's attorney that they need not give evidence which would incriminate them. Dr. France made no promises of immunity and knows of none being made.

The witness says further that, up to the time of the testimony, about 40 indictments had been found against the rioters. Most of these were in the Federal court, on the ground that the United States mail train had been stolen to carry the dynamite and men. Eight men had been indicted for murder and conspiracy in Judge Stewart's State court. (471, 472, 476.)

Mr. HUTTON, engineer, says he was promised by the coroner, Dr. France, that if he would identify the men on the train he would be given his liberty. As a matter of fact the witness had not recognized any of the masked men at the time of the riot. (565.)

Mr. SINCLAIR denies emphatically that he has ever intimated to any prisoner that he would be discharged or otherwise benefited by giving testimony against other men. No improper question has been put to the prisoners and they have not been permitted to incriminate themselves. (552, 553, 563.)

D. Declaration of martial law and its justification (see also *County Officers*, p. cv).—Mr. SINCLAIR, State auditor of Idaho, testifies that he was given power by the governor, immediately after the riot of April 29, to proceed to Shoshone County and take whatever measures he deemed necessary to convict the parties who had been engaged in the crime. He arrived about May 1 and at his request the governor declared martial law in force in the district on May 3 or 4. The witness justifies this action on the ground that the entire district was in a state of insurrection and unrest. The county was in control of a set of incompetent and corrupt officials. No arrests had been made, and no attempt at arrests had been made. The sheriff had not deputized a large posse, but had still declared to the governor that he had the situation well in hand. The witness felt that unless men were arrested immediately a large number of the criminals would leave the State. The importation of the soldiers made it possible to arrest them. (544, 562.)

Mr. Sinclair says further that the summoning of Federal troops was made necessary by the absence of the State militia in the Philippines at the time of the difficulties. There was not a single company of militia left. To secure volunteer troops was out of the question. Moreover, the governor had no power under the law to appoint deputies to make arrests and enforce the law. It was the duty of the sheriff to appoint deputies, but he had entirely failed to do so. Federal troops were near at hand, at Spokane, and it was natural and proper to call them. If State troops had

been employed, they would have been under the command of the State adjutant-general, but he had no authority to command Federal troops. General Merriam, at the head of the Federal soldiers, simply carried out the orders of the State officers, especially of Mr. Sinclair, as representative of the governor. In no case did those orders go beyond the limit of the instructions given to General Merriam by the Secretary of War.

Mr. Sinclair believed that the retention of the Federal troops was still necessary at the time of his testimony, July 28, 1899, in order to protect personal and property rights. It is true that there had been no actual violence since the arrival of the troops. When the troops first came there was a rumor that the miners were coming down to recapture a prisoner, of whose arrest they had heard, but nothing came of this rumor. (551, 552, 554, 562.)

Mr. FINCH, a mine operator, thinks that it was undoubtedly necessary that martial law should be established. If the men had been arrested immediately after the riot, the calling of the soldiers might have been avoided, but when this was neglected it would have been impossible to arrest them later. There were 800 or 900 men on the train, and as many as possible had to be arrested, at least temporarily. (499.)

Mr. SOVEREIGN, editor of the Idaho State Tribune, says that the first arrival of United States troops was welcomed by all classes, but they have since cooperated with the civil authorities of the State to overthrow the county government and to restrict the constitutional rights of citizens. The intervention of the troops was probably not necessary in order to secure the punishment of those concerned in the crimes of April 29, and the troops have enabled the civil authorities to perpetrate acts which they could not have done otherwise. The action of the troops also has been cruel and heartless, especially in the case of the colored troops. Since the colored troops have been withdrawn the witness knows of no particularly odious acts. (393-395, 398, 399, 401.)

Mr. BARNARD, ex-mayor of Wallace, thinks that the intervention of martial law was, on the whole, justified by the weakness and hesitation of the sheriff and county officers, but that a very limited amount of military aid would have enabled the civil authorities to apprehend the criminals and preserve order. Perhaps half of the people of the community are inclined to justify the placing of the district under martial law. This witness also refers to complaints of cruelty against the colored soldiers. There was no necessity, in the opinion of the witness, for the continued presence of the military at the time his testimony was taken, 3 months after the riot. (414, 415, 418-420.)

Mr. GANN, a carpenter and miner, thinks that the presence of the soldiers was uncalled for. The men who were guilty of the crimes would soon have come out boldly, some of them being proud of their act, and could easily have been arrested. (488.)

Mr. GILL, master mechanic of the Tiger and Poorman mine, thinks that it was unnecessary to call on the military authorities to assist in bringing offenders to justice. He believes that there were plenty of men ready to assist the civil authorities in carrying out their duties, and that no further crime was being contemplated. (524.)

Pump men compelled to work by soldiers.—Mr. SOVEREIGN says that the pump men of the Tiger-Poorman mine, who had stopped work in sympathy with the locked-out members of the union, were compelled to return to work by the soldiers under the command of Lieutenant Lyons. (392, 396.) Mr. BARNARD refers to this fact and adds that Lieutenant Lyons acted in this case, he thinks, without any civil authority back of him. (418.)

Mr. CLEARY, a miner of Burke, testifies that on May 25, 1900, he, as acting president of the Burke Miners' Union, was asked by Lieutenant Lyons to summon the union men to a meeting. Mr. Lyons addressed the meeting, stating that the pump men of the Tiger-Poorman mine had quit. He demanded to know whether they had been ordered to quit by the miners' union. The witness, as chairman of the meeting, told Lieutenant Lyons that he did not know. The lieutenant thereupon declared that he would give the pump men of the mine 5 minutes in which to return to work. Mr. Culbertson, manager of the mine, said that he hoped the pump men would go back to work because they were the only men who understood what was needed. Mr. Cleary and Mr. Lyons then left the room and a consultation was held by the union men. When Lieutenant Lyons returned he declared that he would force the pump men to work at the point of the bayonet if necessary, and the men went back to work rather than to submit to force. The witness does not think that the pump men really desired to go back to work or that their previous refusal to do so was simply due to the compulsion of the union. (529, 530.)

Mr. GILL, master mechanic of the Tiger-Poorman mine, says that he, as master

mechanic, reported to Mr. Culbertson, the manager of the mine, that the pump men had decided to quit work and that the mine was filling up with water. Mr. Culbertson asked Lieutenant Lyons, who was present, to see what he could do to prevent this disaster. The witness was afterwards on the same day told by three pump men that they had been ordered by Lieutenant Lyons to go back to work within five minutes. They had decided to do so since otherwise they expected that negro soldiers would force them to work at the point of the bayonet. Their action was entirely due to intimidation. (520.)

Mr. SINCLAIR, State auditor of Idaho, says that he has understood that the pump men at the Tiger-Poorman mine were ordered to leave work by the miners' union, and that Lieutenant Lyons simply told the members of the union at the meeting referred to that it was in violation of State law to prevent the pump men from working. The witness considers Lieutenant Lyons a very capable and discreet man. He has never heard that an order was made that the men should be forced to return to work at the point of the bayonet if necessary. (548.)

E. Arrests of miners.—1. *Complaint as to wholesale and unwarranted arrests.*—Mr. SOVEREIGN declares that after the establishment of martial law and the arrival of the United States troops men were arrested wholesale and held in confinement without any definite charge. Membership in the unions alone was made a sufficient ground for arrest, and about 500 persons were accordingly imprisoned, almost a clean sweep being made in the entire district. These arrests were made by soldiers under the orders of State authorities. Most of the persons arrested had no formal charge made against them and were never granted trial. Many persons who had never been members of the union were also arrested. (393, 395, 399.)

Mr. BARNARD also refers to these wholesale arrests. He thinks that usually the arrests were made at the instance of a deputy sheriff and in his presence, but by the force of the United States soldiers. The soldiers went up the canyon to Burke and then "took a drag net" down the canyon. Many men thus arrested have been held for months without trial. (413, 415, 418.)

Dr. MATCHETTE testifies that wholesale arrests were made by soldiers, and that miners' houses were searched, nominally to find arms. Many of those arrested had been held at the time of his testimony for about 3 months without definite charges and without trial. There is no justice or law in this action. Mr. Sinclair has told different men on letting them go, that there was nothing against them and never had been, but that the authorities simply wanted to give them a taste of what would be done if they ever committed such crimes. The witness knows of cases where the families of miners would have suffered owing to such arrests, except for assistance from other people. The witness also refers to threats with pistols and abusive language used by the deputy sheriff toward two men, named Shannon and Pressley. (434-436.)

Mr. GILLEN, a miner, also complains of the wholesale and unwarranted arrests. Men are being discharged from the "bull pen" from time to time, since nothing can be found against them. The State auditor, Mr. Sinclair, asks the prisoners questions, and if their answers are satisfactory lets them go. Meantime they have not been permitted to consult counsel. (426, 427.)

2. *Individual instances of alleged unwarranted arrests.*—Mr. MILLER, night watchman at the Tiger-Poorman mine, testifies that he was sick and in the hospital up to May 2, although he was allowed to go down into the street for an hour or so each day. He first learned of the riot in the afternoon. He condemns such violent action strongly. He was discharged from the hospital on May 2, but was still under treatment and unwell. On May 4 a crowd of soldiers and men came down the canyon, and the witness, thinking the matter more or less of a joke, called out asking them if he was wanted, and they said he was and arrested him. (429.)

Mr. Miller says further that everything was quiet in Burke and up to the time of his arrest. There was plenty of time for those with guilty consciences to get away. The witness was a member of the union, but never attended but one meeting. (430.)

Mr. BARNARD refers especially to one John Chiddester. He had been summoned three times before the coroner's jury, having to travel about 20 miles at his own expense. When he remonstrated against this he was arrested. The acting sheriff, Dr. France, told the witness that there was no charge against Mr. Chiddester, but that he would probably be a good witness. (413, 415, 418.)

Mr. GILLEN, a miner and member of the Gem Union, testifies that he was arrested on the ground of being a union man, although he had been asleep during the day of April 29 and had not heard of the riot until the afternoon. He was discharged after a few days, there being no charge against him. He was again arrested on June 23 on the charge of intimidating nonunion men. At the time he was talking with a friend

and he implies that it was supposed that he was intimidating this man. As a matter of fact, the witness says that he had intimidated no one. He had never told anyone to stay away from work, although he had, when asked, stated the facts concerning the strike. Mr. Gillen was again discharged after two days. (421.)

Mr. CREEDON, a miner, testifies that he was arrested and kept in jail nearly 9 weeks. It was only after many demands that he succeeded in learning that he was charged with having interfered with the United States mail on April 29. After about 6 weeks he was taken before the coroner's jury and asked about "every conceivable thing under the sun," most of which had nothing to do with the mails. He was then released on bond. (525, 527.)

Mr. GILL, master mechanic of the Tiger and Poorman mine, testifies that there were about 40 or 45 men under his direction on April 29, 1899. It is impossible for the engineers, pump men, electricians, etc., to leave work at all without danger to the mine, and none of these men accordingly left the mine on that day. The witness himself and many men were, nevertheless, arrested afterwards, but when the authorities were shown that the mine would suffer if they were held prisoners they were set free after a very short time. (519-521.)

Mr. GANN, a carpenter and miner, employed in the Tiger Mine, at Burke, testifies that he was arrested on May 4, 1899, along with perhaps 300 others. No charges were preferred against him, and he had not been at Wardner during the riot. He was finally released when witnesses had proved that he was in Burke during the time. (486-489.)

Mr. MURPHY, a bartender of Burke, testifies that he was not a member of any union and had no knowledge of what was planned on April 29. He tried to get on the train going to Wardner, but it was so crowded that he could not. He did go down to Wardner on a hand car about 4:30 in the afternoon. On May 4 he was arrested without any charge and put with about 300 others in a barn. He was kept there 2 or 3 days and complains of severe treatment. Affidavits having then been produced showing that he was in Burke during the riot, he was let out. The witness says that civil officers were present directing the arrest in his case. (431, 432.)

Mr. HUTTON, the engineer who ran the train from Burke to Wardner, testifies that he was arrested for the first time on May 30, Mr. Sinclair stating to him that he was charged with conspiracy. He was held without trial or formal charge for 2 weeks and then released. (565.)

Mr. STEVENSON, justice of the peace at Gem, testifies that on April 29 he met two acquaintances about 2 o'clock in the afternoon, who could not have been at the scene of the riot. Nevertheless they were both afterwards arrested. One of them was a stranger in the country who had been there only a short time.

Mr. Stevenson also submitted a series of affidavits made before him as justice of the peace by 12 persons, chiefly miners. Nearly all of these declared that the affiant had been arrested without warrant or complaint and kept in prison without trial for various periods. Two of these men declare that they were not in the State of Idaho on April 29, and are strangers in the Coeur d'Alene region. One of the affidavits states that the affiant was ordered out of the country by a captain of the soldiers at the point of a gun.

Mr. Stevenson himself was arrested at one time. As a justice of the peace he had ordered the arrest of a certain man who had been hanging around the residence of one Mr. Goldensmith. This man had refused to answer before the court, and the justice had been compelled to order the constable to remove his cap, which was done in an orderly manner. The witness was afterwards arrested and Mr. Sinclair told him that his arrest was due to his having allowed this person to be "pulled and kicked and cuffed around." There were no other charges against Mr. Stevenson, but he was kept in prison for 19 days and finally discharged without trial.

As a further illustration of the domination of the State authorities over the legally constituted authorities, Mr. Stevenson states that at another time he arrested a man for ill-treating a woman; but a deputy sheriff or deputy marshal told him, "If you cinch that man there will be four more arrests immediately," which the witness interpreted as a threat that he himself would be thrown into prison if he pushed the case. (509-518.)

Mr. SINCLAIR makes a somewhat different statement as to the arrest of Mr. Stevenson. He says that the man who was arrested by warrant of Mr. Stevenson was a nonunion man who had secured a permit and who was simply lounging about waiting for an opportunity to get work. Some lady made complaint against him as a vagrant. When he was brought before the justice his hat was knocked from his head and he was assaulted. One of the deputy sheriffs warned the justice at the time that a nonunion man was entitled to as much consideration as a union man. As a result of this action the justice was arrested but was released after examination.

The statements made by Mr. Stevenson concerning his retention and treatment are believed by Mr. Sinclair to be perverted. The arrest was justified on the ground that Mr. Stevenson had disregarded the law in imprisoning a man on such a frivolous charge. (548, 549.)

3. *Justification of numerous arrests and detentions.*—MR. SINCLAIR, State auditor of Idaho, says that he discovered on arriving in the Coeur d'Alene district that almost the entire community had been engaged in the crime of April 29, and it seemed necessary to arrest practically all the men in the district. It was impossible to avoid arresting many who did not participate in the riot, but as soon as that fact could be ascertained they were immediately released, every possible means being taken to facilitate hearings. The witness supposes that probably more than 500 were arrested in the first instance and that from 200 to 250 were still imprisoned at the time of his testimony. (545.)

Mr. Sinclair says further, that he believes the great majority of those who were arrested were implicated to a greater or less extent in the crime of April 29. From 1,000 to 1,200 men were present at the destruction of the property, and although undoubtedly a large number of these were ignorant as to what the unions had resolved to do, yet the number of innocent men does not appear to be so great as Mr. Sinclair had first thought. It is necessary frequently in every State to arrest innocent men and hold them until they are proved innocent. A great many men who were arrested in the Coeur d'Alene district have been discharged for lack of sufficient evidence to convict them, although there is moral certainty that they were guilty to some degree.

The men arrested were not held any longer than was absolutely necessary. As soon as a grand jury could be formed investigations were made and the men were either indicted, held for further investigation, or discharged. Some men have complained that they were held without being charged with crime, whereas they were, in fact, already indicted, although for the sake of the best interest of justice they were for a time kept ignorant of the indictment. Altogether, between 300 and 400 indictments were issued from the Federal courts alone, and practically all of those in prison at the time of Mr. Sinclair's testimony were under indictment. Some of the indictments which have been found have not been made public lest the accused persons should attempt to escape. A few persons are held as military prisoners under martial law. (552, 553, 563.)

Mr. FINCH, a mine operator, regrets the necessity which the State authorities have felt for the arrest of so many miners. Nevertheless, there were 800 or 900 men on the train, and since these men would not tell who the ringleaders were it was necessary to arrest a great many pending the securing of evidence. Those arrested were afterwards liberated as rapidly as possible. (499, 500.)

4. *Alleged arrests by military authorities.*—MR. GILL understands that Lieutenant Lyons and other military officers frequently made arrests without action by the civil authorities. (522.)

Mr. STEVENSON testifies that he saw 3 men arrested by 2 military officers without the presence of a deputy sheriff. One of the soldiers who took part in making the arrest expressed a desire, in very profane language, to kill some of the white men. (512.)

Mr. SINCLAIR says that State deputies were appointed in large numbers and that the arrests were made by these deputies with the assistance of the United States soldiers. (545.)

Dr. FRANCE testifies that the governor appointed a number of men, who, perhaps, acted as United States deputy marshals, though the witness does not know their precise official capacity. Dr. France, as acting sheriff, also appointed a few deputies. The witness has never heard of a case where the United States soldiers arrested a man without direction of these civil officers. (475.)

Dr. MATCHETTE thinks that civil officers were present at each arrest directing the soldiers. (436.)

Mr. GILLEN also says that all the arrests which he had witnessed were made by deputies accompanied by soldiers. (427.)

Mr. MURPHY thinks probably a deputy was present when he was arrested. (432.)

F. Alleged illtreatment of prisoners.—1. *Complaints of illtreatment.*—MR. SOVEREIGN, editor of the Idaho State Tribune, asserts that the prisoners after their arrest were abused by their guards, especially so long as the colored troops remained in charge. (395.)

Mr. GILLEN, who was arrested a few days after the riot of April 29, complains of cruel treatment. In conveying the prisoners to the bull pen a negro prodded him with a bayonet so that he suffered from it for two or three days. There were 35 or 36 men in a car being taken to the prison, and they were kept for over 20 hours without water, and for 24 hours without food. While he was in the bull pen he saw

soldiers strike two different men severely over the head with guns. One man was slapped in the face, pipes and knives were taken away from others. The first night after his arrest, the witness and others were compelled to sleep in a barn with only a little straw, under which was a wet manure pile. Afterwards the men were compelled to build a guardhouse, and were ordered about with violent language. The cruelty was chiefly practiced by colored soldiers. The white officers were more disposed to be kind, and there was no special complaint after the colored troops were removed.

This witness estimates that there were about 800 men in the bull pen at one time, but says that these were discharged from time to time when nothing was found against them, so that there were only about 300 there when he was imprisoned the second time, in June. Among the prisoners were a good many foreigners, including many Swedes, who are not, the witness thinks, a vicious class of men. There were more foreigners than native Americans imprisoned. Mr. Gillen says that the prisoners were permitted to talk with their friends in the presence of guards. (421-427.)

Mr. GILL testifies that practically all miners in the town of Burke were arrested, and that those going out of the mine were taken with their wet clothes, as result of which many of them suffered severely. (521.)

Mr. GANN, a miner, declares that the miners arrested were taken just as they came out of the mines, with their wet clothing, and they suffered greatly from cold, especially on the night after their arrest, when they were kept in a barn. The men had no food for the first 24 hours. During their confinement in the barn there was great danger from fire. The men were compelled to work and were sometimes prodded with bayonets. The witness saw one man with a wound over one-half inch deep from a bayonet. Part of the food was fairly good, but at other times it was horrible. The witness was not personally maltreated although he was often cursed by the soldiers. (486, 487.)

Mr. STEVENSON, justice of the peace at Gem, Idaho, says that while he was in the bull pen he was forced to work in the kitchen and also outside, although he was 60 years old, and feeble. It was understood that an order had been issued that if the place took fire, of which there was very great danger, no man should be allowed to escape. In fact, the witness heard an officer tell the prisoners that in case of fire they might run toward the guardhouse, but would be shot if they ran in any other direction. The witness saw a soldier run his bayonet through one man's coat. He also refers to abusive and threatening language used by the soldiers in making arrests. (510-512.)

Several of the persons who submitted affidavits in connection with the testimony of Mr. Stevenson declare that they suffered abuse and hardships during their imprisonment in the bull pen. One states that he was kept in a box car for about 2 weeks, and that during that time he saw 2 men slapped in the face by colored soldiers and another threatened with an uplifted gun for conversing with a fellow prisoner. Another affiant declares that he was taken out of his bed and forced to dig in a ditch at the point of a bayonet, and also that prisoners were told that in case of fire they must not try to escape. Another witness says that he was kept in a box car for about 3 weeks with other men and that they were treated like cattle; he was at one time knocked down by a gun in the hands of a soldier. (515-519.)

Mr. CREEDON, a miner, says that after he was first arrested he was placed with others in a box car and that they were given no food or water for 26 hours. When he asked for water he was told to keep his mouth shut or his head would be shot off. He saw a great many men who were jabbed with bayonets at that time and afterwards. The men were frequently threatened with abusive language, and clubbed with guns.

For some time after leaving the box car the prisoners, when eating their meals, were compelled to sit down on the wet manure. It rained continually and the men suffered greatly with cold and wet. After they were moved to the new quarters in the "bull pen" they still suffered, since the buildings leaked greatly. The witness was sick and suffered severely as result of this illtreatment and he was still compelled to work, the doctor having declared that he was able to do so. (526, 527.)

Mr. MILLER, night watchman, says that the men with whom he was arrested were taken in a box car and conveyed to a barn where they were searched. The witness complains of the illtreatment received. The men were compelled to sleep on the floor, and he himself was pushed about with a bayonet and threatened with a pistol. Two days after about 20 of the men were called out and a few questions were asked by Lieutenant Holbrook, after which these men were let go. While in the prison the colored guards referred to the witness as a bad man and a dynamiter. Everything was damp and cold, while the soldiers declared that they had orders to shoot down the prisoners if a fire should break out. (429, 430).

Mr. YOUNG, ex-sheriff of Shoshone County, says that the colored soldiers were very abusive, especially in their language, toward the prisoners in the bull pen. He has seen them make jabs with their bayonets at the men, but does not think that the men were actually hurt. (539).

Mr. Young was confined, along with Mr. Stimson and Mr. Boyle, county commissioners, in the guardhouse, a small building near the bull pen. The witness was put into one corner and told not to converse with the other prisoners, and was threatened when he attempted afterwards to do so. After a few days, however, conversation was permitted. The guardhouse was very open, and, as it rained nearly every day, the prisoners suffered greatly, Mr. Boyle especially contracting a very severe cold. (535).

Mr. HUTTON testifies that while he was in the bull pen, for about two weeks after May 30, there was no particular suffering from hunger and thirst, or conspicuous ill-treatment by the soldiers. He was told by the prisoners, however, that they had been much worse treated earlier; that they had been slapped and struck and had suffered in other ways. At the time the witness was in the bull pen the men were merely furnished a little hay to sleep on and had to go without blankets, unless they furnished them themselves. (567).

2. *Illtreatment denied.*—Mr. SINCLAIR, state auditor in charge at the Coeur d'Alene district, denies that there was any illtreatment of prisoners at any time. He would have been in a position to know if anything of the sort had occurred, and there was no disposition on the part of the troops who guarded the prisoners to keep anything secret. Very many men had been arrested and many of these, not being used to restraint, considered anything in the nature of discipline as an indignity. The conduct of the soldiers can not be characterized as unduly harsh.

Mr. Sinclair specifically denies that men were arrested in their wet clothing, with no opportunity for proper protection from the weather. The orders were that the men should be given the privilege of getting their blankets. Some failed to bring blankets and the State had none at the time to give them. In fact the witness did not consider it proper for the State to get new blankets and clothing for the short time during which most of the men were to be held.

It is true that some men were confined for a considerable time in box cars, but they remained there by preference rather than to be placed in the barn which was used for some time as a prison. As to the barn itself it had been cleaned and properly arranged for the prisoners. The witness never heard any complaint of lack of food or water, either immediately after the arrests or later on. Those who declare that they had no food or water for from 25 to 36 hours after being arrested are "infamous liars." The provision of food and shelter has been better than in any other prison in Idaho, or indeed in the Northwest.

The witness declares that no men have been bayoneted or maltreated by the troops. He does not know concerning the claim that the prisoners in the guardhouse were forbidden to speak to one another during 5 days. (549-551, 555.)

Dr. FRANCE, coroner, testifies that when the prisoners were first arrested, no place having been provided for such an emergency, it was necessary to put them in a large barn. There they had hay and straw to lie on and many had their blankets. As rapidly as possible the State provided quarters for them. The so-called "bull pen" was built, consisting of four buildings, each 150 feet long, with a row of bunks on each side and a passageway down the middle. The largest number of men ever in this prison was 600 or 700, and in July about 190 or 195 remained. The witness has heard no complaints concerning ill treatment of the men; he knows that the food was nutritious and sufficient, and that the soldiers never practiced any cruelties upon the prisoners. As fast as it was possible to become satisfied that prisoners were not implicated in the crimes they were released. (473, 474.)

3. *Treatment of sick and dying prisoners.*—Dr. MATCHETTE, of Wardner, says that the men arrested were at first kept in an old barn where they had to lie on the floor. Some sick men had been arrested and others became sick in the prison. One man especially had a high fever. The witness visited these sick men several times, but Mr. Sinclair then excluded him and also refused to permit bonds to be given by which the men with the fever could be taken out. (434.)

Mr. SOVEREIGN says those sick and dying were denied the right to see their relatives and also denied religious consolation. Two or three or four have died in prison. The case of one Mike Devine is specially mentioned. (397.)

Mr. GANN refers to the sickness of Mike Devine, who was arrested just after he had come out from the hospital. He had a relapse, and, although Dr. Stratton said he would be all right in two or three days, he afterwards died. The witness does not know that he was refused spiritual consolation, but Mr. Gann was not permitted to care for Mr. Devine in the hospital as Mr. Devine requested. (486-487.)

Mr. SINCLAIR asserts that the statement that men dying in the bull pen were refused religious consolation when requested is absolutely false. A Catholic priest had been requested to hold service whenever the prisoners cared for it and the witness saw him on the grounds perhaps a hundred times. This priest contradicted the report that he had ever been denied access to the prison, and as to the particular case of Mike Devine asserted that he was not even a member of the Catholic Church in good standing, and that he had never asked for a dispensation. The witness had also given strict orders, which were carried out to the letter, that Dr. France should be called to anyone who was sick and that every attention should be given. (559.)

Dr. FRANCE declares that there was no case where medical aid or the presence of a priest was refused to sick prisoners. The man Devine who died in the bull pen did not ask for a priest. Another man, however, who had been taken from the bull pen to Dr. France's private hospital, was visited by a priest. The nurse at first refused the priest permission to enter, but Dr. France himself told him to go in. The charge on this subject arises from misunderstanding. There were but two deaths from diseases in the bull pen—one from pneumonia and one from a form of typhoid fever. These were not due, the witness believes, to the unsanitary condition of the prison.

One person named Johnson was adjudged insane, and the witness, with the deputy sheriff, started to take him to a State institution. At the railway depot the man escaped and ran toward the river. The guard shot at him and, by direction of Dr. France, shot high. The man jumped into the river, owing to his insanity, as the witness believes, and was drowned. The charge that he was shot, and also that his insanity was due to his being forced to testify to a falsehood before the coroner's jury, was denied. (473-475.)

G. The permit system.—1. *Form of proclamation and of application for permits.*—After the governor of Idaho had proclaimed martial law in the Coeur d'Alene district a proclamation was issued, signed by Bartlett Sinclair, state auditor, "by order of the governor," and approved by Gen. H. C. Merriam, regarding the miners' organizations. (SOVEREIGN, 390.)

This proclamation declares that whereas "certain organizations or combinations existing in Shoshone County have shown themselves to be criminal in purpose," inciting to destruction of property and of life, the mine owners are notified that they must not employ men belonging to such criminal organizations. The persons applying for work in the mines must obtain a permit from Dr. Hugh France, must deny all participation in the riots, and renounce membership in any society which has incited violation of law.

The following is part of the form of application for such permit required from union men:

I am a ——— by occupation. I am a native of ———, and am a ——— citizen of the United States. I last worked at the ——— mine in ———. My shift boss was ———. Heretofore I have been a member of ——— Miners' Union. I did not participate, actively or otherwise, in the riots which took place at Wardner on the 29th of April, 1899. Believing that the crimes committed at Wardner on said date were actively incited, encouraged, and perpetrated through and by means of the influence and direction of the miners' unions of the Coeur d'Alenes, I hereby express my unqualified disapproval of said acts, and hereby renounce and forever abjure all allegiance to the said miners' union of which I was a former member, and I solemnly pledge myself to obey the law and not to again seek membership in any society which will encourage or tolerate any violation of law.

(390, 391.)

On attention being called to the fact that the permit apparently is somewhat more definite in its designation of the miners' organizations as criminal bodies than the proclamation, Dr. FRANCE declares that it was the understanding at the time the proclamation was issued that the miners' unions were responsible for the riot, and that it was intended to apply to these. Every other mine in the district except the Bunker Hill mine was employing union men, so that the presumption was necessarily that the riot was conducted by them. (471, 477.)

There is no inconsistency, Mr. Sinclair affirms, between the forms of application for permits and the terms of the proclamation. Both were devised by Mr. Sinclair and had the same purpose. Since Mr. Sinclair himself was the author of the proclamation and could readily secure the consent of the governor to any necessary changes or extensions, it could not be said that he was restricted by the terms of the proclamation. As a matter of fact the proclamation is broader rather than narrower than the requirements in the application. It refers to criminal organizations in general, whereas the application for permit refers specifically to only one criminal organization, the miners' union. If it be found later that other organizations are criminal, additional forms of application will be required. On some occasions, to satisfy the feelings of individual men whom the witness could trust, the terms of the application have been somewhat modified. The application for persons not members of the union does not require the application to denounce the union. The witness could, if he wished, permit men to work without signing any of the applications. (545.)

2. *Authorship of proclamation.*—Mr. SOVEREIGN declares that the United States troops, under the command of Gen. H. C. Merriam, exceeded their authority in connection with the strike at Wardner. The proclamation of the governor of Idaho concerning the miners' unions was approved by General Merriam. Secretary Alger afterwards directed him to have nothing whatever to do with enforcing rules for the government of mines or miners' unions. (393.)

Mr. BURBIDGE testifies that this proclamation was drawn up by Mr. Sinclair, Dr. France, then acting as sheriff, together with Judge Lindley, of San Francisco. He does not know what influences were brought to bear to secure its issue. Some of the other witnesses think that the officers of the Bunker Hill mine had something to do with drawing it up. Mr. Burbidge expresses his general approval of the proclamation. (453.)

Dr. FRANCE testifies that the proclamation concerning the permit and the form of permit were prepared by Judge Lindley, attorney for the Bunker Hill company, Mr. Sinclair, and General Merriam himself. (471.)

Mr. SINCLAIR, state auditor of Idaho, who was placed in charge of the Coeur d'Alene district as the representative of the governor, declares he himself was the originator of the permit system. Although Judge Lindley assisted in writing the proclamation concerning the permits, the terms of the proclamation and of the permit were devised by Mr. Sinclair. Judge Lindley, although he was attorney for the Bunker Hill and Sullivan Company, was acting in the place of the State attorney-general and by his protection. The entry upon the proclamation concerning the permit "examined and approved, H. C. Merriam," does not mean that General Merriam joined in the authorship of the proclamation, but simply that he undertook to protect the agents of the State against violence in enforcing the proclamation as a portion of the State law. (545, 555.)

3. *Purpose and justification of system.* (See also, as to character of miners' unions, p. ci).—Mr. SINCLAIR says that it is the purpose to examine men applying for permits carefully and to refuse them to any man who is shown to be criminal in character or to approve criminal methods. He believes that this device is necessary to drive out the criminal element rather than to rely upon criminal trials, because of the impossibility of getting conclusive evidence in many cases, especially under the conditions which exist in Shoshone County. The witness regrets the necessity of adopting the system, but knows of none more effective.

Mr. SINCLAIR asserts that the permit system is approved by all the mine owners in the region and by a great majority of the law-abiding citizens. Some of the union men, though probably not a great many, have signed the applications, especially foremen and other prominent employees. The system has so far worked to the entire satisfaction of those who devised it.

Careful consideration was given to the constitutional and legal rights of citizens in drawing up the terms of the permits, etc. It is acknowledged that the system would not be tolerated under civil law. It is clearly contrary to the existing statute of Idaho, which makes it a crime to exact from any person as a condition of employment a promise that he will not be a member of a union. But the system gets its validity from martial law, under which unusual and extreme measures are justified, such as, for example, the closing of saloons and the prohibition of public gatherings.

Mr. SINCLAIR asserts that the requirement of the permit was necessitated by the extraordinary conditions existing in the district. Great bodies of men had defied the civil law, had committed arson and murder, and yet had returned to work without punishment by the local authorities or by their employers. The entire district had been in a state of lawlessness for years, and the miners' unions were distinctly criminal organizations, which it was necessary to destroy.

The only purpose of the permit system, Mr. Sinclair concludes, is to establish law and order. To this end it is necessary that the State should have something to say as to the character of the men who may be employed in the mines of the Coeur d'Alene district. In any case men are put under no more restraint by the system than they were by the unions themselves when they excluded nonunion men from the mines. (545-547, 557-561.)

Mr. Sinclair denies especially that the State authorities have any opposition whatever to unions as such, or that they have any inclination on the side of the employers and mine owners as against the miners. There is no sympathy for one mining company, such as the Bunker Hill and Sullivan Company, rather than for another. The governor of Idaho was formerly a laboring man and a member of the Typographical Union, and the mine inspector (who apparently approves the methods employed), was a member of the miners' union. Mr. Sinclair himself believes that unions are necessary as a protection to the interests of labor. All of these officers desire to see unions established in the Coeur d'Alene district. But it is the purpose to drive

out the criminal element of the population, to teach the people to distinguish between unionism and crime. The State can not afford the expense nor the dangers of such riots and revolutions as have occurred in the Coeur d'Alene district every few years; and since the miners' unions, as hitherto constituted, have been largely responsible for these lawless conditions, they must be broken up. (547, 554, 556, 558, 562.)

Mr. Sinclair further asserts that it is not true that when men have been discharged from the prison from time to time they have been warned to leave the country. On the contrary, the witness says that he has frequently told the men that he did not want them to leave the State, and it has been publicly made known that there is no disposition on the part of the State to run out law-abiding men. (556.)

Mr. FINCH, an officer of certain mines on Canyon Creek, says that the mine owners at first felt that the State authorities were unduly severe in the conditions imposed regarding permits. But those authorities were thoroughly convinced that the miners' unions of the Coeur d'Alene district were criminal organizations and must be broken up. The witness has changed his opinion, and believes that the action was, on the whole, necessary. The conditions were such as to demand drastic measures. The State authorities believe it was necessary to drive out some of the union men and to bring in a lot of new men to leaven the public opinion of the district. A large proportion of the miners have refused to sign the permits and many are now wandering through the mine regions of the West looking for work. Some of the men, especially carpenters and pump men, engineers, etc., were inclined to take out permits, except for fear of the unions. (494-498.)

Dr. FRANCE and Mr. BURBIDGE both defend the permit system as necessary to destroy the criminal organizations in the Coeur d'Alenes. (457, 477.)

4. *Objections to requirement of permits.*—Mr. SOVEREIGN denounces in the strongest terms the requirement of the permit as a condition of work. It interferes with the right of contract guaranteed by constitution and statute, both as regards the mine operators and the miners. In this connection the witness quotes the act of Idaho making it unlawful for employers to enter into agreements with their employees not to become or continue members of labor organizations. Dr. France, Mr. Sovereign continues, who has charge of issuing permits, was, at the time he became sheriff by virtue of the arrest of the elected sheriff, a beneficiary of the Bunker Hill company, receiving a salary of about \$400 per month through its hospital. The officers issuing permits, under his direction have exercised their own discretion as to granting them. The system has been strictly enforced. The Hunter mining company, for example, which was reopening its workings, employed about 27 men without permits, but the mine was closed on the order of the governor, aided by the military authorities. In fact, through the operation of this system the mining industry of the district is practically suspended. Had it not been for the proclamation most of the mining companies would have continued their operations, and their employees would not have been disturbed. One mine operator made a contract with his men to recognize them as soon as the permit system was abandoned, but the governor has boasted that he would keep the State under martial law for two years if he could not otherwise destroy the miners' unions in the district. Few of the miners have signed the agreement. They have felt that it was contrary to their constitutional liberties, and, moreover, that if they signed they would be barred from employment in any union camp in all the mining regions. (390-392, 396.)

Mr. BARNARD, ex-mayor of Wallace, also declares that the requirement of the permit has had a very demoralizing effect upon the miners and the miners' unions. It has driven many of the best men from the country, since they consider the requirement an insult to free Americans. All the union men with whom the witness has talked except one have declared absolutely that they would not work under those circumstances, and the witness does not think that the one referred to felt that the promise made was a permanently binding one. An officer of one of the mines has told at least one employee that if he signed the permit he could go back to the union after the permit system was abandoned. Very few indeed of the men have signed the permits. The witness thinks the arrangement is injurious to the mine owners and to the business men generally, as well as to the miners. (414, 415, 419.)

Mr. GILLEN, a miner, declares that all the miners consider the conditions imposed for obtaining these permits outrageous. Even those who are strongest in condemning the acts of April 29 are as persistent in opposing the permit system as those who were guilty. (424, 425.)

Mr. GILL, master mechanic of the Tiger-Poorman mine, says that although none of the 40 or 45 men who were employed in his department took part in the riot on April 29, they were nevertheless required to take out permits in order to continue employment. Most of them have refused to do so believing that the system is an unjust interference with their liberty. The requirement of the permit has even been

extended to heads of departments, and Mr. Gill himself has refused to comply with the demand. He considers the system entirely unjust, since he does not believe that the miners' unions are responsible for the crimes. He has heard some people say that the proclamation regarding permits was written by Judge Lindley, the attorney of the Bunker Hill and Sullivan Company. (515, 524.)

Mr. MILLER, night watchman of the Tiger-Poorman mine, declares that he would not sign a permit under any circumstances. The men who are signing them are the kind who are hurting the miners. The system is unjust and unAmerican. The witness knows that the majority of the union men are law-abiding and opposed to any such action as that of April 29. The witness himself had declared on that day, when he saw a man with a gun and a mask, that such methods were all wrong. (430, 431.)

Dr. MATCHETTE testifies that the union men are not at all disposed to sign the applications for permits. The witness considers, as they do, that it would be signing away their liberty. He has heard Mr. Sinclair say that those who expressed an opinion against the permits would not be given any afterwards. The witness says further that a somewhat similar permit system has been in effect at the Bunker Hill mine for 4 or 5 years. (434, 435.)

Mr. Doud, county tax assessor, thinks that the permit system has been injurious in its effects in closing the mines in the Coeur d'Alene district for a considerable period, although most of them had resumed work at the time of his testimony. There had been no difficulties between the miners and mine owners, except at the Bunker Hill and Sullivan Mine, but all the mines were operating peaceably. The miners have been unwilling to sacrifice their independence and manhood by signing the applications for permits and the result has been greatly to interfere with the operation of the mines. (539, 540.)

5. *Reopening of mines since permit system.*—Mr. BURBIDGE testifies that since the riot the Bunker Hill company has been employing over 300 men, including mostly its former nonunion employees. A large part of these men were at work at the time of the testimony in rebuilding the company's mill. (455.)

Mr. MACDONALD, of the Helena-Frisco mine, says it has been operating since the strike with about 250 men, largely brought from other states. The company has not had time to arrange for permits for all of the men. About 700 men altogether are working in the various mines on Canyon Creek. (481, 482.)

Mr. BURBIDGE says that, apparently since the strike, about 25 per cent of the employees of the Bunker Hill mine are foreign born, including natives of Great Britain, Scandinavians, and perhaps 5 or 6 Italians. The Norwegians and Scandinavians, as a race, are considered to be law-abiding people. (452.)

Mr. MACDONALD, of the Helena-Frisco mine, says that of the employees of that mine before the strike about 10½ per cent were native born, the remainder being largely Italians and Scandinavians. Since the strike 80 per cent of the employees, who have been brought from various states, are native Americans. (484, 485.)

H. The miners' unions and their character.—(See also p. LXXXVIII.)

1. *Organization of unions.*—The findings of the coroner's jury on the bodies of John Smith and James Cheyne state that there were at the time of the riot of April 29, 1899, four miners' organizations in Shoshone county, at Wardner, Burke, Gem, and Mullan, respectively. These are practically continuations of the unions existing at the time of the riots of 1892, although their charters were issued in 1893 by the Western Federation of Miners. (465.)

Mr. SOVEREIGN testifies that the miners' unions in the Coeur d'Alene district are affiliated either with the Western Labor Union or the Western Federation of Miners. A closer relation has recently been established between these two organizations than before, and at the same time the employees outside of the mine and those inside have been brought more closely together. The membership has grown rapidly in the last few years. The constitutions of these unions are similar to those of trade unions generally. (389.)

2. *History of lawless acts in earlier years.*—Mr. MACDONALD, manager of the Helena-Frisco mine, testifies concerning earlier actions of the unions in the Coeur d'Alene district. After referring to the riot of July 1, 1892, he says that on June 20, 1894, a committee of the union notified him that 6 or 7 nonunion men must be discharged or they would be done away with. The witness accordingly discharged them. The Milwaukee Mining Company received a similar notice at that time but refused to discharge men, and on July 3 a masked mob came to Gem and killed John Kneebone. From that time on the unions repeatedly compelled mine owners to discharge men and drove them out of the canyon. The witness found it necessary to comply with their demands from time to time.

On December 23, 1897, a man named Whitney, superintendent of the Helena-Frisco mill was shot. In 1898 Dan Conners, shift boss of the Standard mine, was

given 3 days to get out of the country. About the same time the union men attempted to drive another man out of the Helena-Frisco mine, hitting him with a club. He turned about and shot one of his assailants.

In another case the Black Bear mine discharged a man who had been a member of the union. The union men went to the shift boss and told him that the man must be paid for all the time he was out of work or else the boss would be driven out of the district; and he was forced to yield. Men were also killed in Burke at different times. (479-484.)

Mr. FINCH, an officer of the Standard Mining Company and of the Hecla Mining Company, who has been in the Cœur d'Alene district since 1887, says that there was no trouble between mine operators and their men up to 1891. Regular miners were paid \$3.50 per day, car men and shovelers \$3 per day. In 1891 unions were formed at Gem and Burke, no objections being made by the mine operators. Soon after the men demanded that shovelers and car men also be paid \$3.50 per day. The operators protested that these men were not skilled, but the unions based their demand on the fact that they shared the same risks as the miners. The mine owners shut down their mines, and later on began to get men from Lake Superior and elsewhere to operate their mines. On July 10, 1892, a report was started that two union men had been killed at Gem by the scabs. The next morning a crowd of union men, about 400, attacked the Frisco mine, blew up its mill, killing 3 of the men who were in it, and shooting at those who escaped. The union men then attacked the mill at Gem, which was defended by a number of miners and mill men and some hired deputies. These were forced to surrender, the superintendent of the Gem mine agreeing to send the nonunion men out of the country. The mob then proceeded to Wardner to capture the Wardner mill. The superintendent of the Bunker Hill mine at that place had meantime surrendered and had sent at least 280 nonunion men out of the country. As the men from the Gem mine were waiting to take the steamer at the Mission on July 12, having no arms, they were attacked by 15 or 18 men armed with rifles. As many as were caught were robbed. Two men were shot but afterwards recovered. Six others were never accounted for, perhaps having got lost on the mountains or perhaps having finally escaped. The State authorities declared the district under martial law, and numerous arrests were made. About 16 men were sentenced to serve terms of from 4 to 8 months each. They were considered as martyrs to the common cause, and were not kept in prison very closely. The most of the mines at that time agreed to recognize the unions and to pay the union wages, \$3.50 per day, for all underground workers. (489, 490.)

Mr. SOVEREIGN says that the great strike in the Cœur d'Alene district in 1892 resulted from an attempt on the part of the employers to compel each employee to pay an assessment of \$1 per month for a hospital fund. The miners preferred securing their own medical service. The employers imported a large number of laborers at the time of this strike, and many of the old laborers had to abandon their homes. It has been the usual custom of mine operators in the district to barricade their works and employ armed men to protect their property, which has had the effect of exasperating the miners. The witness has never known of any strikes of importance in Idaho outside of the Cœur d'Alene district. (389, 407, 408.)

Dr. FRANCE testifies that on July 11, 1892, there was a pitched battle between the union and nonunion men, in which 3 union and 2 nonunion men were killed. The nonunion men were driven out of Canyon Creek. Dr. France at that time appeared as witness for the State in prosecuting the criminals, and has since been known as the scab doctor. (461, 462.)

Mr. FINCH describes the murder of John Kneebone in 1893. He says that the act was done by 20 or 30 men only poorly disguised; that they were seen by a great many people and must have been well known; but that in spite of a reward of \$10,000, no evidence was ever submitted against any of the men.

Mr. Neil, the superintendent of the Gem mine, and 3 other men were at this same time marched up the canyon. In the snow on the mountains they were made to kneel down and promise never to come back, but they were afterwards rescued by a party from the mines. One of the men, who was not strong, caught a cold which developed into consumption, as a result of this experience. (491-492.)

Mr. BURBIDGE submitted a number of extracts from newspapers published in the Cœur d'Alene district tending to show the criminal character of the miners' organizations. He declares that these extracts are fairly selected. Most of them are from the Cœur d'Alene Miner. According to these extracts, on April 24, 1894, a delegation pretending to act by the authority of the Gem miners' union submitted to the managers of the Gem and Frisco mines a list of 23 men whose discharge they demanded. It is declared that this committee acted without authority, the proposition having in fact been voted down by the union. Later it is stated that much indigna-

tion had been expressed because 15 or more employees of these mines had been notified by a committee from the miners' union to leave the country. On July '3, 1894, a body of about 40 masked and armed men came into Gem from the direction of Burke hunting for men who had been ordered to leave the country. John Kneebone was found and shot dead. The mob then captured the superintendent, Mr. Neil, and some other officers, and marched them to the Montana border, several miles, and ordered them to leave the country. The report of the grand jury on the murder of John Kneebone, which was submitted by the witness, states the facts of the murder, but declares that the perpetrators could not be discovered. The report goes on to say that it is supposed that many of the masked men must have been known to the residents of Gem and Burke, but that no one would testify against them. While the grand jury recognized the good of labor unions and does not charge this outrage to the concerted action of anyone, it declares "it is the pity or shame of too many labor organizations that outrages are committed in their names by a few men belonging to them, while either a false sentiment of loyalty or the fear of the consequence of revealing the authors of the crime too often prevents the punishment of the perpetrators * * * ." The Silver Star, a paper in sympathy with the unions generally, declared at the time that no blame for this outrage could be laid at the doors of the unions, since the "scabs" had been duly requested to go away. The blame is due to overzealous men, "among whom no doubt the greater part may have belonged to the union, acting of their individual accord." (444-447.)

Mr. FINCH also describes the murder of Mr. Whitney on December 23, 1897. Whitney was a new superintendent at the Frisco mill. He had discharged two or three men and had been notified by the unions to leave the country. When he failed to do so he was seized by about 20 men and taken down through Gem and then shot in the back. No one appeared to claim the large reward offered. (491.)

This witness also describes the case of Dan Connors, shift boss of the Standard mine, who was driven out in 1898. Mr. Connors was eating lunch with about 50 of the miners at the Standard mine when 2 men entered the room with revolvers and ordered him outside, where 2 others joined them. He was given 3 days to leave the country, and he did so after selling his house and furniture for what he could get. He told the mine operators the names of the men whom he thought were his assailants, and the Standard mine discharged 2 who were in its employ. Any attempt at prosecution would have been futile, although many men knew the guilty parties. (491.) Mr. GANN thinks that this particular case was the result of a personal grudge against Mr. Connors, and that the union as a union had nothing to do with it. (492.)

Mr. SOVEREIGN refers to the case of Dan Connors as showing the law-abiding character of the unions of this district. Mr. Connors was himself a member of the union and declared to Mr. Sovereign at the time he was driven out that the action was purely a personal matter between himself and the 4 men who drove him out. He, however, refused to remain in the region, and become a prosecuting witness against these men. The Burke miners' union soon afterwards passed a series of resolutions declaring that it had no animosity toward Mr. Connors, who was a member of the union, and denouncing the outrage in the strongest terms. (403, 404.)

Mr. BURBIDGE submitted another item from the Miner of July 14, 1894, referring to the attempt to blow up the electric power house of the Bunker Hill mine. Mr. Burbidge knows this to have been a fact.

On November 22, 1894, the Wardner miners' union resolved to stop the work at the Morning mine and the Bunker Hill mines, until all men eligible to membership should join the union or be driven out. A committee notified the manager of the mines that only union men must be employed, and when the demand was refused a strike was ordered.

Another attempt was made to blow up the Bunker Hill concentrator on May 10, 1896. The flume furnishing water power for the mill was blown up and kindling saturated with coal oil was placed against the building and lighted, but was afterwards extinguished. Mr. Burbidge declares further that the miners regularly celebrate as a public holiday the anniversary of the blowing up of the Frisco mill on July 11, 1892, on which occasion 5 men were killed. (444-449.)

3. *General statements as to criminal character.*—Mr. FINCH says that, broadly speaking, no one in the Cœur d'Alene district during the past five years has dared to criticise any act of the unions, even mildly. All of the offenses above described, and others, were supposed to be acts on the part of union men, and they were not disavowed by the unions. The witness believes that the majority of the men belonging to the unions are law abiding; that they disapprove, for example, what was done at Wardner, but that they have been almost completely under the domination of hot-headed and unreliable leaders. Being more or less uneducated, they have been carried away by unfair representations and agitation. The various unions are largely

controlled by what is called the central union, composed of two delegates from each of the separate bodies. This small number of men practically controls the whole machinery. The members are afraid to disobey their orders. The fact is that the Western Federation of Miners, which extends through all the mining States, is itself largely under the control of extremists, and the miners fear to act contrary to the leaders because they could not get work anywhere.

Mr. Finch favors the organization of labor, generally speaking, and thinks most mine owners would rather have good unions established than to employ all non-union men. He thinks labor difficulties are largely due to misunderstandings, and that it would be better for representatives on each side to get together and discuss matters in a fair manner. The difficulty has arisen from arbitrary action on both sides. The employers have found it best, and are usually willing, to listen to complaints from the unions, especially when the unions think that any man has been unjustly discharged. (493-500.)

Mr. BURBIDGE thinks that the labor organizations at present existing in the Cœur d'Alene district are to be considered criminal in nature, and that it is just to punish them as organizations for the recent outrages.

He declares that nonunion men have often received notices signed by union officers ordering them to join the union or to leave the country. He admits that there are many law-abiding citizens among the unions, but declares that union men and officers were in the mob which destroyed the property on April 29. He believes that men have the right to combine for their own interests and to get as much money as possible for their work, and has no objections to unions so long as they are law abiding, but if 99 men in a mine are dissatisfied and one is satisfied, that one should have the right to continue work. The opposition of the mine owners to the unions arises when they try to run the business of the mine. The witness declares that in the Cœur d'Alene district foremen and superintendents of mines dare not discharge men for misconduct or neglect of duty for fear of their lives. (440-454, 457.)

Mr. BURBIDGE refers to an account of the riot of April 29 which appeared in the Idaho State Tribune, edited by J. R. Sovereign. The heading reads: "Bunker Hill destroyed. One thousand determined men wreak vengeance on the scab mine. * * * Martial law threatened for the entire district." Many references are made in the article to the alleged interest of the Standard Oil Company in the mine. (444.)

Mr. SINCLAIR asserts that it has been the principle of the miners' unions to compel those who sought work in the mines to join the union or to leave the country. The unions have given the newcomers time to earn enough money to pay dues, and have then insisted upon their becoming members. (561.)

Mr. McDONALD says that the unions have not even permitted nonunion men to join the organization, but have driven them out entirely. New men were permitted to work for a few days, and then, if unable to give the union grip, their records were investigated at the camps from which they came, and unless satisfactory they would be ordered down the canyon on the ground simply that they were not in sympathy with the union.

Mr. McDonald thinks that miners' unions are desirable if properly conducted. He has himself been a working miner and a member of the union. (484.)

4. *Denial of criminal character.*—Mr. SOVEREIGN, editor of the Idaho State Tribune, declares that labor organizations generally, and those in the Cœur d'Alene district as well, are entirely incapable of organizing criminal movements. They have too large a conservative element among their members, men who would testify in any court concerning crime committed by the organization. When crimes are committed in labor disputes they are usually by men who, while probably members of the unions, organize for their criminal purposes entirely outside.

Mr. Sovereign admits that people are inclined to attribute such acts as the riot of April 29 to organized labor, and thinks that the unions should do everything possible to free themselves from this unjust charge. He does not believe that the unions in the district have been able to hold regular meetings since the riot on account of the absence of a quorum, but all the union men with whom he has talked have deprecated that action. (394, 403, 407.)

Mr. GILL, master mechanic of the Tiger and Poorman mine, thinks that the miners' unions of the Cœur d'Alene district have always been orderly. When men have been driven out they have usually been objectionable characters, and the driving out was done not so much by the unions as by groups of miners. The witness thinks that the accumulation of a little property by the miners has a great influence in checking lawlessness. (521-523.)

Mr. O'LEARY, acting president of the Burke Miners' Union, says that the only

pledge, so far as he knows, which is required of members of the union is that contained in the ritual of the Western Federation of Miners, as follows:

"I, ———, in the presence of Almighty God and the members here assembled, most solemnly and sincerely pledge and obligate myself to be a true and faithful member of ——— Union, No. ———, of the Western Federation of Miners." (530.)

Mr. CREEDON, a member of one of the unions, declares that those organizations are thoroughly law-abiding. He had not been a member of the union very long before the riot and had seldom attended the meetings, but he believes that the requirement of the constitution that members shall be of good moral character is carried out to the best of the ability of the unions. In times gone by they have offered rewards and passed resolutions condemning crimes committed in the vicinity. (528.)

Mr. Creedon declares that Mr. Jay, who has been foreman of the Frisco mine for several years, recently told him that there was no truth in the statement that the miners' unions had dictated who should be employed and discharged; he himself had never been obliged to hire men or to discharge them at the command of the union. Mr. Jay has lost his position as foreman because he would not take out a permit. (528.)

Mr. HUTTON, the engineer of the train which carried the rioters from Burke to Wardner, declares that he thinks the majority of the men living on Canyon Creek are good citizens, and that he does not consider the miners' unions criminal organizations. He thinks that practically only the men who were masked and armed on April 29 knew what the general plan was. (567, 568.)

As to violations of law in earlier years, Mr. YOUNG, the sheriff, thinks that none of them can be charged to the miners' unions. He has always heard that whenever propositions to take lawless action were raised they were distinctly rejected by the unions. In fact, the unions have passed resolutions condemning various acts of violence. The witness admits, however, that despite large rewards offered for those guilty of various murders, no one has been arrested. (536, 537.)

Mr. GILLEN, a miner, says that although no business has been transacted by the Gem Union since the riot, he has heard members of that union at its hall condemn the actions at Wardner. He has never known the organizations of miners to defend violent measures, and there is nothing in their constitution or general character to keep law-abiding citizens from becoming members. The records of the Gem Union were taken out of its hall in order to prevent them from being seized. (421, 423-426.)

I. Removal of county commissioners and sheriff.—1. *Charges against these officers.*—Mr. ERVIN, deputy clerk of the district court of Shoshone County, Idaho, submitted a copy of the decision of that court removing from office Messrs. Simmons, Boyle, and Stimson, members of the board of county commissioners, and James D. Young, sheriff of the county. The decision, after summarizing the numerous charges made against these officers and the replies of the defendants, reaches the following conclusions:

The proceedings were brought under a statute requiring the court to summon and examine any officer charged with having refused or neglected to perform his official duties. The county commissioners can exercise only powers granted by the statute, and are bound to carry out all the directions of the statutes. Ignorance of the law will not excuse any person. Neglect may arise either from corrupt motives or incompetency.

The fact that the board of county commissioners held its session at the town of Murray, notwithstanding the election transferring the county seat to Wallace, could scarcely be considered neglect of official duty sufficient to warrant removal from office. On the other hand, the county commissioners have approved the bonds of the sheriff, tax collector, and assessor, although the sureties signing the bonds had not paid taxes upon sums double the amount of the bonds, as required by the statute, the amount of their assessed valuations being very much less than the amount required. This approval was in clear disregard of law. The commissioners also violated their duty in paying a commission to Mr. Young as sheriff on the collection of money for State and county licenses, since this was a claim not authorized by law, the sheriff's fees being strictly fixed. The commissioners also abused their authority in issuing liquor licenses without application and without bonds.

Finally, the commissioners were negligent in failing to take steps to check the disturbance at Wardner. On April 26, 1899, representatives of the Bunker Hill and Sullivan Mining Company notified each of the county commissioners of the condition of affairs prevailing, of the fact that an armed mob of miners was using force against the employees of the company. The only result was that a conversation was held between Mr. Simmons and the sheriff, in which the sheriff informed Mr. Simmons that there had been a little trouble, but that everything was all right, and Mr. Simmons directed the sheriff to see that no property was destroyed. No communication

was had between the members of the board of commissioners after this notification. The commissioners are the chief executive authority of the county and it was their duty to personally visit the scene and to meet in special session to take such action as might be necessary. The commissioners do not seem to have realized the responsibilities resting upon them and were thus guilty of violating the law.

The court also finds that the sheriff was neglectful of his duties, on the basis of his own testimony. He did nothing whatever to prevent the difficulties which occurred at Kellogg on April 29. He took no steps to apprehend or arrest those participating in such unlawful acts. He rode on the train with the men to Kellogg, heard their talk, followed in their steps, witnessed the destruction of the Bunker Hill and Sullivan Mining Company's property, and permitted, almost within his view, the murder of two men. Afterwards he took no action to identify or apprehend the criminals.

Judgment was accordingly entered by the court removing the county commissioners and the sheriff from office. (501-508.)

The findings of the coroner's jury as to the murder of Cheyne and Smith declare that during the week before the riot of April 29 an appeal was made by the Bunker Hill company to the county commissioners to take some precautionary measures, but none of them paid the slightest attention to the request. The sheriff, James D. Young, was also appealed to, but wholly neglected to perform his duty. He came down on the train from Wallace with the mob, associated with them throughout the day, held long conversations with masked leaders, refused to appoint proper deputies, and aided and abetted the conspiracy. He gave no warnings of the approach of the mob, although he had opportunity to do so, and after the riot deceived the governor of Idaho in asserting that he had the situation well in hand. The jury accordingly charged that the commissioners and sheriff aided and abetted the miners' unions in their crimes. (469, 470.)

Mr. SINCLAIR insists that Mr. Young, as sheriff, might have made a great many arrests after the riot of April 29 if he had possessed ordinary courage, ability, and integrity. He and the other county officers permitted the criminals to escape, as Mr. Sinclair believes, knowingly. The law requires that the sheriff shall appoint necessary deputies, and that if he can not himself cope with the situation he shall notify the State officers. As a matter of fact, the sheriff stated to the governor that he had the situation thoroughly in command and failed to reply to numerous telegrams inquiring as to the details of the existing conditions. (552, 562, 563.)

Mr. BURBIDGE, assistant manager of the Bunker Hill mine, says that he thinks if there had been a brave and determined sheriff in the county there would have been no riot. On April 26 the sheriff was notified of the strained conditions. Mr. J. M. Porter, engineer of the Bunker Hill mine, asked the sheriff to appoint him as deputy, but the sheriff refused to do so and advised the company to settle with the union. At that time he was shown a notice warning trespassers to keep off the road belonging to the company, and did not object to it; but on the next day he declared that the road was a public one (which the witness denies), and added that if any body of men wanted to go up that road, whether armed or not, he was going to see that they did so. It is true, the witness admits, that the sheriff attempted to dissuade the rioters from the action on April 29, but after the murders and the destruction of the property he telegraphed to the governor of the State that he had the situation well in hand and did not need assistance. (451, 452.)

Mr. FINCH, a mine operator, believes that vigorous action on the part of the sheriff and county commissioners might have prevented the riots of April 29. A sufficient number of deputy sheriffs could probably have been brought from the southern end of the county. (499.)

2. *Defense of county officers.*—Mr. YOUNG, ex-sheriff of Shoshone County Idaho, testifies that he was impeached on July 11 and removed from office. One charge made against him was that his bonds were insufficient. The law requires that the bond of the sheriff shall be in the sum of \$10,000. The county commissioners had requested county officers to secure bondsmen qualified in double the amount specified by law. The signers of the bond of the witness were worth \$21,000, but some of them had failed to pay their taxes at the proper time and were not strictly qualified according to law. Nevertheless there was no complaint on this subject until after the riot. The chief charge against the sheriff was that he had aided and abetted the miners in the violations on that day.

Mr. Young describes in some detail what occurred before and during the riot. He says that on April 26 Mr. Porter, a man in the employ of the Bunker Hill and Sullivan Company, telephoned to him that the miners had formed a blockade near the mine and asked that he, Mr. Porter, be appointed a deputy. The witness replied that there was already a deputy at Wardner. Mr. Young went to the mine that day, and in the meantime told his deputy that no more violence or blockades must be

permitted. The miners told the witness that they would not further interfere with the working of the mine. The witness received a telegram from the governor to the effect that it was understood that an armed mob was in possession of the mine. To this he replied that he had investigated the matter and that apparently no further trouble was likely to take place. From that time until April 29 there was no violence or assembly of an armed mob.

The witness received no intimation of the intended disturbance until the train containing the rioters actually arrived in Wallace on April 29. He is at a loss to understand why the mine owners of Canyon Creek who had seen the train start did not notify him. He understands that the train had been seized at Burke and the engineer and fireman compelled to run it at the dictation of the mob. The witness believed that the only possible chance of checking the mob was for him to board the train and go with them. He got on the baggage car and found it filled with men, nearly all masked and armed. He was told not to get out of the car. He had left word with his deputy at Wallace to telegraph to the deputy at Wardner to swear in as many men as possible and arm them. But the deputy at Wardner, like the witness himself, had supposed that the attack would be upon the mine itself rather than upon the mill and accordingly did not arrive at the actual scene of the riot. When the train arrived at Kellogg the witness closed the saloons, and then requested some of the bystanders at the railway station to help disband the mob, but they simply laughed at him. The witness then went as near as possible to the mob and ordered them to disband in the name of the people of Idaho. He was prevented from getting nearer to the body of the men by the number of masked and armed men. It is not true, he declares, that after ordering the mob to disband he remarked in a careless manner that he had done his duty, or that he had done all he could, and did not care.

The sheriff followed the mob on its way to the mill, but about 200 yards from the mill he was put in charge of a number of armed men and forced to stand up against a fence while the mill was destroyed.

Mr. Young declares that he did all that was possible to check the mob. It would have been useless to secure a small posse. There should have been at least 200 armed men to cope with the rioters, and it would have required several days, probably two weeks, to get enough men together, and especially to secure arms for them. The witness believes that the attack on the mine was definitely planned and that it would have been impossible to prevent it except by a very large body. He thinks there must have been between 800 and 1,000 men on the train, and that from 180 to 200 of these were armed and masked. (529-538.)

After the riot the witness remained for about 2 days at Wardner protecting, with a number of deputies, the Last Chance Mine, which the manager believed to be in danger of destruction. He made no attempt for the time being to arrest the perpetrators of the outrage of April 29. On consultation with the county attorney it seemed best to wait until the mob had been dispersed, and until a large body of men could be secured to make arrests. The witness does not think, however, that it was necessary to declare martial law, but believes that without it a great many more guilty men would have been arrested than actually were taken. (534, 535.)

Mr. Young testified further that on May 3 he was summoned to Wallace to attend the coroner's jury, and was held there for 3 or 4 days before testifying. He then made a deposition, and while writing it in the presence of Attorney-General Hayes and State Auditor Sinclair Hayes requested him to resign his office. When he refused to do so he was arrested.

Mr. Young says also that after he was removed from office he was still retained in prison; this time in the county jail, and not released until July 27. He was not informed of the reason why he was held after the trial of the impeachment proceedings. The witness says that while he was in the prison he and Mr. Boyle were permitted to go at liberty, at least for 1 night, by the deputy in charge, to whom they each paid \$4 for that privilege. When Mr. Young was released on July 27 it was on condition that he accept a subpoena to appear as a witness on September 4, 1899. (538.)

Mr. Doud, county tax assessor, thinks that Mr. Young did all in his power to prevent the violence of April 29. After his interview with Mr. Burbidge on April 26 the sheriff appointed several deputies in Wardner, and was there in person to see that no violence was done. Everything seemed quiet enough up to the time of the riot. (541.)

Mr. STEVENSON, a justice of the peace at Gem, thinks that the sheriff did all that was possible to prevent the blowing up of the Bunker Hill Mine. He does not believe the sheriff knew in advance of the purpose of the mob. At that time it would have been impossible to get enough deputies to prevent violence. The sheriff

could not have taken possession of the engine of the train going to Wardner, since there were so many men upon the train. (512.)

Mr. SOVEREIGN refers to an interview with Mr. Sinclair reported in the Spokane paper, in which he declared that the 2 county commissioners arrested might be dangerous to the community, in that they might incite the people to overt acts and might order the illegal disbursement of public moneys. As a matter of fact, no overt acts had been committed, so Mr. Sovereign declares. The only charge brought against them was that they did not take precautionary measures, and this they could not do on account of the suddenness of the raid. Moreover, the witness declares the commissioners and sheriff did not have an opportunity to take action to punish the crime, since the governor almost immediately put the county under martial law and removed their powers. The attorney-general of the State afterwards brought up some old technical charges against the commissioners as a basis for removing them—for example, that they held a meeting outside the county seat in June, had paid a large sum to one of their members for repairing a clock, and that the bonds of county officers had been approved without sufficient security. (400, 401.)

Mr. BARNARD, ex-mayor of Wallace, thinks that the county commissioners and the sheriff were honorable men, but believes that they were weak and that the declaration of martial law was therefore, perhaps, necessary. The sheriff should have made a strong endeavor to keep the peace, swearing in a number of deputies; but it is doubtful if even then he could have prevented the crime of July 29. The witness thinks the sheriff was also somewhat negligent in trying to apprehend the criminals after the act. The charges on which the county commissioners were actually removed were small technicalities. Two of the commissioners were put in the bull pen without any definite charge. One of them told the witness that he was asked to go to the office of Mr. Sinclair to sign a paper. He refused to sign and was then ordered under arrest. The sheriff was also arrested and kept during the first night in a little shack where he could not lie down on account of the wet ground, since it was raining heavily.

3. *Alleged political motives for removal and for other acts of State authorities.*—Mr. BARNARD is of the opinion that politics has had something to do with the change in the county officers. The officers removed were Populists. The governor is a Democrat and the new officers are Silver Republicans and Democrats. Though there is a difference of opinion in the community, many believe that some such political influence has caused this action. (413, 416.)

Mr. SOVEREIGN also thinks that political influence had something to do with the appointing of the new county officers. It was the purpose of the governor, he believes, with the assistance of the military authorities, to entirely subvert the local government. It is claimed that the governor has strong aspirations for the Senate, and that he needs control of Shoshone County to carry the legislature, and is therefore trying to change its entire political complexion. With this object in view, the editor of the Mullan Mirror was arrested and his plant afterwards confiscated, in order to prevent criticism of the governor. The witness adds that an effort is being made under the new county officers to restore the validity of \$100,000 of bonds, which are subject to litigation at present in the courts. (394, 405, 406.)

Mr. YOUNG attributes the action in ousting him and the county commissioners from office, as well as the arrest of so many men and the establishment of a permit system, largely to political influences. He thinks that the State authorities have steadily supported the employers as against the employees in the Cœur D'Alene district, and especially that they have assisted the Bunker Hill and Sullivan Company. About 1896 the Bunker Hill Company was maintaining a military guard, having organized part of its employees into a company of State militia furnished with arms by the State authorities. At that time the witness went as a delegate to the Populist State convention at Boise City. The Democratic convention was being held at the same time, and Mr. Steunenberg was candidate for nomination as governor by both the Populist and Democratic parties. The Populists promised to support him on condition that he would come immediately, if elected as governor, to the Cœur D'Alene district and investigate the relations between the Bunker Hill Company and its employees, especially as to the maintenance of a military force. After he was elected he failed to fulfill this promise. The Populists have a considerable majority in Shoshone County, and the witness believes it is the purpose of the State authorities to destroy that majority. He thinks that fully 80 per cent of the men who were arrested and confined in the bull pen were Populists, and that a large number of these believe that their arrest was due to political influence. (531, 532, 537.)

Dr. MATCHETTE says that he has no doubt that politics has had some influence in leading to the changes in the county officers and in causing the numerous arrests.

The Populists have heretofore controlled the county, and the other parties have felt very sore. A similar opinion, he believes, is shared by many of the people. (427.)

Mr. GILL thinks that the requirement of the permit was not intended so much to drive criminals out of the country as to break up the miners' unions, and especially to change the political situation in Shoshone County. The Populists have had a considerable majority in the county, and they have not got on well with the Democratic State officers. (521, 523.)

Mr. SINCLAIR, on the other hand, declares that politics has had absolutely no influence either in the removal of the county officers or in the arrest of miners. The governor can have no political influence in the matter, since he knows very little about what is being done, having intrusted the situation entirely to Mr. Sinclair. The witness himself is not much of a politician; he does not know what majority the opponents of the governor and himself received in Shoshone County; as to the new commissioners and sheriff, he did not know their politics until after they were appointed. The witness is sorry for the Populist party if it is true that it has a specially large representation in the prison, but politics certainly has nothing to do with that fact. (557.)

Dr. FRANCE declares that the idea that politics may have entered into this matter is entirely new to him and that he knows as a matter of fact that no political influences or motives entered into the arrest of miners or the removal of the county officers. He does not know whether the men in the bull pen are Populists, Republicans, or Democrats. (470, 476.)

IV. CAPITAL IN COAL MINING IN THE EASTERN AND CENTRAL STATES.¹

A. Use of the several varieties of coal.—Mr. LUCAS, editor of The Black Diamond, says that bituminous coal is chiefly used in manufacturing. Some anthracite coal is used in malting, and in a few other lines where a pure carbon is required. The use of coke for steam making is increasing, particularly in the East. It is used by the Boston and Maine Railroad on locomotives and in many of its stations. In nearly all instances where bituminous coal is used in the business portion of Chicago some smoke-consuming device is used; but the devices are not effective. (673.)

Mr. Lucas says that there is no cannel coal in Illinois, and the greater part of what is used there comes from Kentucky. There is some in southern Indiana. Cannel coal is used for manufacturing gas. It is very rich in gas. (675.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that the markets for coal produced in northern Illinois are mostly in the Northwest, but comparatively near the mines. On account of the low rates of water transportation and the railway discriminations, coal from West Virginia and Pennsylvania is sold in St. Paul, the Dakotas, and other more distant states, at lower prices, considering the quality, than Illinois coal can be sold. Illinois coal is so inferior that it could not be marketed at all, except for the great saving in transportation to the near states. About 65 per cent of Illinois coal is used for railway purposes. The cost of mining in Illinois is very high. (105, 112.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that in early days, when coal was mined by the pick exclusively, 10 or 12 inches of coal at the bottom of the vein was left, being considered unsalable. By the introduction of machinery this, which was formerly wasted, is taken out, and by improved methods of combustion it can be satisfactorily burned. Automatic stokers, in fact, require this grade of coal. (86.)

Mr. ROBINSON says that the demand for coal for domestic purposes varies greatly according to the weather in winter. It is falling off relatively every year by the introduction of furnaces, steam heat, and other improved methods of burning, and by the use of oil, gasoline, and gas. The demand for manufacturing and steam purposes increases steadily. (11, 12.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that the competition of bituminous coal with anthracite has greatly increased, to the injury of the anthracite industry. The consumption of gas in gas stoves and gas heaters, especially in the New England States, has cut down the tonnage of anthracite coal very largely in the last few years. (652.)

B. Competing districts. (See also *Freight rates*, p. cxi.)—Mr. PEARCE says it is difficult to establish uniform scales of wages in mines owing to the differences of conditions in veins of coal and in methods of working; but a good deal has been accomplished in this direction. Relatively uniform wages are necessary on account

¹ For a digest of testimony relating to coal mining in the far West, see p. XLVI.

of the competition of different districts. In 1896 one company in the Pittsburg district insisted on paying wages below other operators, and the latter were soon forced to follow. The miners of the Hocking Valley, owing to this competition, were forced to lie idle until the officers of the miners' organization persuaded them to accept voluntarily a reduction of 16 cents per ton to equalize conditions. (95.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that there is a constant overproduction of coal which demoralizes prices. One of the chief difficulties in keeping up reasonable prices is that the conditions of competition are not the same in different districts. There are certain natural influences affecting the cost of production, such as the conditions of ventilation, water in the mines, thickness of veins, etc. Aside from these, in some districts, wages are kept at lower rates, since the trade unions have not been able to extend their control uniformly over all districts. Owing to the inequality of wages in different districts and mines, certain operators are producing coal with a pick at a cost as low as other Pittsburg operators are producing with machinery. The operators of the Pittsburg district suffer especially from the competition of West Virginia, a comparatively new mining region where the men are little organized and are paid lower wages. The West Virginia district also secures specially low railway rates, enabling it to compete in the markets of Chicago and the Northwest. Railways have been opened up in regions where they had little earning power and have been disposed to haul coal at a rate sufficiently low to enable it to be put upon the market, in order to secure business for themselves. At times also the officers of the roads have been interested in mines. Coal in West Virginia is largely mined by measure rather than by weight, which gives further advantage to the operators in securing cheap mining. The witness believes that the only salvation of the coal business is the organization of a trust. (74, 77.)

Mr. LUCAS presents a table showing the number of men employed in coal mining in Illinois from 1890 to 1899, the days of active operation, the tonnage, the price paid for mining, and the reported value of coal per ton. The tonnage rose from 15,275,000 in 1890 to nearly 20,000,000 in 1893, fell to a little over 17,000,000 the next year, rose to 20,000,000 in 1897, and, after falling off 1,500,000 in 1898, rose to 23,434,000 in 1899. The greatest number of men were employed in 1895, when the production was smaller than in any other year of the ten except 1890 and 1894. The number of days of active operation was greatest, however, in 1893, when the production was also greater than in any other year of the ten except 1897 and 1899. The price paid for mining rose from 68 cents a ton in 1890 to 72 cents in 1892, then fell steadily to 44 cents in 1898, and rose to 47 cents in 1899. The reported value of the coal at the mine varied between \$1 to \$1.03 from 1890 to 1894. It then fell to 85 cents in 1897, and in 1898 and 1899 stood at about 92 cents. (677.)

Mr. Lucas states that there are about 400 large coal mines in Illinois in about 20 or 30 counties. Twenty-five or thirty thousand men are employed in them. The production is larger than ever before, and the wages of the men are higher. (674.)

C. Ownership and tenure of coal lands.—1. *Bituminous*.—Mr. LUCAS, editor of *The Black Diamond*, says that there is very little ownership of coal mines, so far as he is aware, by manufacturers in Chicago. One or two railroads are largely interested in some mines in the northern Illinois fields. The Federal Steel Company is interested in some mines, and may have a controlling interest in them, but the mines are owned by a separate corporation. The Federal Steel Company takes a large part of the output of these mines, but it does not get its whole supply from them. It consumes something like 1,000 or 1,500 cars of coal a day. (674.)

Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, asserts that no railroads in Illinois admit that they own coal lands, and that he does not know whether any of them are interested indirectly or not. (683.)

2. *Anthracite*.—Mr. Loomis, superintendent of the coal mining department of the Delaware, Lackawanna and Western Railway, says that his road has leased some of its coal land to other operators, and a considerable proportion of the coal which it mines is mined on land owned by others, under a lease and on a royalty. The royalty varies with the circumstances, and is much smaller under leases made years ago than under those made recently. In leases made at the present time the royalty runs from 8 cents a ton to 55. The company holds a considerable amount of mining land which it does not work. This land is held in fee. Mr. Loomis knows nothing of any lands leased by the company which it does not intend to mine for many years. (659, 662, 663.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company owns and controls about 175,000 acres of land in the anthracite region. About 100,000 acres is coal land. The remainder is not mineral land, but bears, or did bear, timber. In 1899 the company mined about 7,500,000 tons. The output of the preceding year was about 500,000 tons greater. All its coal is shipped over the Pennsylvania and Reading Railroad. Its shipments

constitute about 85 per cent of the shipments of anthracite over that road when the mines are running full, and perhaps 80 per cent or less when the company is running short time. The company mines about 18 per cent of the whole output of anthracite, while about 20½ or 21 per cent of the whole is shipped over the Reading Railroad.

The Reading Company owns all the stock of the Philadelphia and Reading Coal and Iron Company, and also all the stock of the Philadelphia and Reading Railroad. (644, 645, 650, 651.)

Mr. MARCY says that the Raub Coal Company, of Luzerne, Pa., of which he is superintendent, is a small independent mining company which produced last year between 120,000 and 130,000 tons of anthracite. Its mining land is leased from various persons under some 10 or 12 different leases. None of it is owned by railroad companies, except one small piece which belongs to the Lehigh Valley, and was leased by it to the Temple Iron Company and subleased to the Raub Coal Company. The railroad companies own very little mining land in Mr. Marcy's immediate vicinity. There is very little subleasing. Mr. Marcy does not know of an instance of subleasing except that in which he is interested. (664, 667.)

D. Freight rates.—1. *Anthracite.*—According to Mr. JAMES, of the United Mine Workers, the recent combination of the railways reaching the anthracite districts is believed to have been intended to prevent individual operators from building a road of their own to the sea. The rates for shipping coal are undoubtedly extortionate. The charge is usually two-fifths of the selling price of the coal at the seaboard. The rate from Hazleton to Allentown, 52 miles, is \$1.10 per ton; to Philadelphia, 114 miles, \$1.55 per ton. (150.)

Mr. Brooks, an anthracite operator, says that the railways which enter the anthracite region themselves produce two-thirds of the coal and purchase most of that produced by independent operators, allowing them 60 per cent of the price at tidewater, which is practically fixed by the railways. The average distance hauled is about 145 miles. The transportation rates are thus excessively high, amounting to about 10 mills per ton per mile. The rate on bituminous coal is only about 2½ mills. The Interstate Commerce Commission was once appealed to, but replied that while it had power to declare rates excessive, it had no power to enforce its decision. The railway companies are able to dominate the independent producers by lowering prices of coal at the mines while keeping up their freight rates. A reduction in rates would greatly extend the market for anthracite coal. (154-156, 163.)

Mr. MARCY, an independent anthracite operator, says that several years ago, before he began to sell his coal free on board at the mine, the freight rate to tidewater ranged from \$1.45 to \$1.60 on prepared sizes; on the lower sizes it was less. He has figured the freight at 9 mills and at 11 mills a ton a mile. Perhaps the average would be about 10 mills. (666, 667.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, testifies that his company pays the Reading Railroad Company exactly the same freight for shipping coal which independent operators pay. It ships like any other producer at an established rate of freight. (650.)

Mr. MITCHELL, president of the United Mine Workers, says that the independent operators in the anthracite field are absolutely at the mercy of the railroads. The railroad companies charge 4 times as much for hauling anthracite coal as they would charge for hauling bituminous coal an equal distance. The coal companies operated by the railroads often appear to lose money, because the railroads charge these companies also excessive freight rates, simply taking the money which should be properly credited to the coal department and charging it as freight rate, in order thus to keep up the rates against independent producers.

2. *Discrimination between places.*—Mr. ROBINSON, a coal operator of West Virginia, says that rates should be adjusted, as far as railways can afford it, to give competing districts equal opportunities, quality of coal, etc., being considered. Distance is not a main factor; often a somewhat longer haul can be made with little added expense. Grades and other conditions must also be considered. The equalization of competing districts is advantageous to consumers as well as to producers. (6-8.)

Mr. MULLINS, a coal operator from Ohio, says that the Ohio operators have no combination for marketing their coal, but sell wherever freight rates will enable them to do so. The chief markets are Cleveland, Toledo, and Detroit. The railway companies to some extent own mines, and by keeping up freight rates are able to underbid independent operators in taking large contracts. The freight rates from West Virginia to the lake are lower than from Ohio mines, not more than half as far distant, so that competition from West Virginia is unduly stimulated, to the injury of Ohio and Pennsylvania coal operators. The production of West Virginia has increased in a short time from 1,000,000 to 13,000,000 tons, while without favoring discriminations it could hardly have exceeded 3,000,000 tons. West Virginia coal, the witness admits, is of fine quality and cheap to mine. One remedy for this competition would be to extend the miners' organization over that State. (169-174, 177.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, believes that, largely through the efforts of the Interstate Commerce Commission, discrimination between individual mines of the same locality has been done away with. The complaint which is made now is that the rates from certain districts and States are relatively lower than from other districts, giving the former an unfair advantage in competition. The chief complaint is as to the low rates made to the State of West Virginia. The witness has been told that the freight rate from the West Virginia mines to St. Paul is \$2 per ton, the same as from northern Illinois. This rate from West Virginia is, moreover, in a certain sense, an all-rail rate, the cars containing coal being transferred across Lake Michigan in car ferries. The distance from West Virginia is probably 1,000 miles; from northern Illinois about 400. Owing to the inferior quality of the Illinois coal, and to the cheapness of lake transportation, the Illinois operators are unable to compete with Pennsylvania and Ohio coals in St. Paul and the more distant Northwest. Such inequalities in rates tend to disturb the conditions of trade and prices, and give rise to labor troubles. (113, 114.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that the distances from West Virginia and from the Hocking Valley to the lake ports and the Northwestern markets are greater than from the Pittsburg district, and the cars from these districts are usually returned empty, while those to the Pittsburg district bring back iron ore. Nevertheless, the railways make the rates such that West Virginia and the Hocking Valley can compete with the Pittsburg district in Northwestern markets. (86, 87.)

Mr. MULLINS, a coal operator of Ohio, says that the officers and stockholders of the Cleveland, Lorain and Wheeling, Wheeling and Lake Erie, Columbus and Hocking Valley, and Toledo and Ohio Central railways are interested in coal mines. Sometimes the railways are able to take large contracts for coal at prices which shut out other operators, keeping their freight rates so high that they can not compete. In some cases, the witness believes, they allow independent operators some share in such contracts. He has heard that the Hocking Valley Railroad at one time used about \$8,000,000 of its stock in purchasing coal territories. The Wheeling and Lake Erie road hauls coal from West Virginia for less than it does from the Ohio mines, not more than half as far distant, and claims that other roads, especially the Baltimore and Ohio, are doing the same thing. The witness has heard of discriminations in supplying cars, but has had no experience of that sort. Fair railway rates are essential to secure just conditions of competition. It is, however, difficult to determine precisely what is just, since some railways cost more than others, and many other factors enter into the question. (170-174.)

Mr. MITCHELL, president of the United Mine Workers, says that it is impossible to secure conclusive proof of discrimination greater than that warranted by the competition of districts. West Virginia coal, which is not always superior in quality, is sold in competition with Ohio and Illinois coal within those States. Coal from West Virginia has been sold at lake ports at less than the published rate of freight. (54.)

3. *Discriminations between persons.*—Mr. ROBINSON, a coal mine operator of West Virginia, says that discrimination between different producers formerly existed in the West Virginia field, but has now apparently ceased. There is now no discrimination in furnishing cars in West Virginia; but the Chesapeake and Ohio Railway Company is often unable to furnish sufficient cars, as was the case in 1898. Operators are opposed to discrimination, which injures the entire district, preventing each operator from estimating accurately the conditions of business. Freight rates are largely regulated by water competition, secured through the improvement of the Great Kanawha River. (6, 11.)

E. Combinations.—1. *Bituminous.*—Mr. LUCAS, editor of *The Black Diamond*, says that there is no trust or combination whatever among the coal operators in the various bituminous fields. The business is strictly competitive. (674.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that, owing to the excessive competition in coal mining and the inequalities in the conditions of competition in different districts, he believes that the only salvation of the coal business is a trust. This would not be likely to result in excessive charges to consumers, since there is so much coal accessible that small new mines could easily be established in competition at any time. (77.)

Mr. MCKAY, a member of the executive board of the United Mine Workers, says that the productive capacity of the mines is so greatly in excess of demand that one operator, by cutting prices, can bring down prices and wage scales for an entire district. This would scarcely be possible if all the other operators were organized. Some joint organization of operators and miners, not so close in form as a trust, should be formed for the purpose of regulating prices and wages. Consumption would not be affected by moderate changes in mining rates. (61-63.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that occasionally operators in local districts form agreements to maintain certain prices for their products, but there is no formal trust or combination of operators, although in the Danville, Ill., district one company sells all the coal from the field. Experiments of such agreements as to prices have usually proved failures, for as soon as there was a falling off in demand some operator would cut prices to secure trade and demoralization would result. Mr. Dalzell deprecates any attempt to form a combination or trust in the coal business, because he believes all combinations to be injurious to both workers and consumers and against the public interest. (114, 119, 122.)

Mr. ROBINSON, a West Virginia operator, says that, generally speaking, combinations are brought about chiefly for a reduction of the expenses of marketing and supervision. They do not injure employees. In West Virginia it was found that buyers of coal played off one mine against others, forcing down prices. Agents of mines were unduly reckless in cutting prices, and themselves constituted a heavy expense. The Chesapeake and Ohio Coal Association admits all mines on an equality and divides orders and cars in proportion to their producing capacity. It does not reduce production. It has one responsible agent for Western markets, with sufficient capital of his own to pay all producers promptly each month. The saving is estimated at 2 or 3 cents per ton. (7-9.)

Mr. MULLINS, an Ohio operator, says that there was formed in 1898 in Ohio a combination of railroad interests known as the Central Coal and Coke Company, but it has been dissolved. The General Hocking Coal Company was also attempted, but was dissolved. Such combinations are generally disapproved by operators. The attempt was to limit the proportion of the total tonnage of each company concerned. (171, 172.)

2. *Anthracite*.—Mr. MITCHELL, president of the United Mine Workers, declares that the anthracite coal railroads and mines are being rapidly concentrated in the hands of a few companies. Ninety per cent of the coal is already owned by 7 railroads, and this is fully 15 per cent more than they owned before the strike of 1900. Many of the largest independent companies have recently sold out to the railroads, and the witness believes that soon the railroads, financed by the Morgan interests, will own absolutely all of the anthracite coal.

Mr. BROOKS, an independent operator, testifying in May, 1899, says that the 11 railways which enter the anthracite regions themselves own two-thirds of the mines and practically fix prices to customers. They buy most of the output of the independent operators, paying them 60 per cent of the prices at tide water. The railways hold a monthly convention and fix selling prices to the consumers, and they apportion among themselves the amount to be produced. (152, 154.)

Mr. JAMES says that the prices of anthracite coal are now regulated, and the amount of the output for each year and for each mine is limited, by the Anthracite Coal Operators' Association. (147.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that the Reading Railroad Company claims, on the basis of its capacity to produce, that it ought to carry 20½ per cent of the demands of the anthracite market. He declares that he has no idea what the agreement is between the Reading and other roads. (651.)

Mr. MARCY, an independent anthracite operator, states that his company has never been a party to any combination or agreement to control the product and prices of coal. He does not know of the existence of anything in the nature of a coal trust. Nothing has transpired in connection with his business that would lead him to believe that prices are fixed by a combination. He has never felt any pressure from any railroad companies or coal dealers. (670.)

F. Independent anthracite operators.—1. *Importance*.—Mr. MARCY, an independent anthracite operator, believes that in his immediate vicinity, near Luzerne, from 40 to 50 per cent of the coal is produced by independent operators. Some of them may, perhaps, be tied up to the coal roads by their leases.

2. *Markets*.—Mr. MARCY says that up to two or three years ago he sold his coal directly wherever he could find a market. He has sold from Richmond to Boston. He is able to ship over the Lehigh Valley, the Delaware, Lackawanna and Western, and the Pennsylvania. He ships under the regular tariff. For two or three years he has sold his output to a single dealer in New York, who also handles the product of several other collieries. Though the transaction is one of actual sale, and not of commission, yet the profit of the New York dealer is virtually a commission, as the price paid to Mr. Marcy is not agreed on in advance, but is based on the prices received by the dealer, or on the prevailing market price. Mr. Marcy does not know exactly what

he will receive for his shipments of the current month. The coal is shipped from the mine wherever the New York dealer may direct. The dealer is not believed to be connected with railroad transportation. Mr. Marcy regards this method of selling as advantageous, because, in order to handle his own coal directly, he must keep track of all the markets and must devote a great deal of time to that work. One who handles many collieries can doubtless do it cheaper. (665-667.)

3. *Relation to the railroads.*—Mr. Brooks, an independent operator, says that about two-thirds of the production of anthracite coal is in the hands of railway companies directly or of their officers. By this means the railway companies are able to dominate the other producers, to fix prices to customers and wages to miners, etc. For several years there has been a contract between the railways and the other producers to purchase from them all coal offered, and to allow them 60 per cent of the selling price at tide water for coarse coal and 45 per cent for pea coal. Eleven railways are associated in this arrangement, and the operators have no choice but to sell their coal to the roads. The productive capacity of the mines being in excess of the demand, the different roads have apportioned among themselves the amount of the total output considered to be salable, and the mines owned by each railway as well as the independent mines which each reaches are practically limited in their output by this limitation upon the amount of coal which the road can haul. The percentages allowed to the different roads are not equitable, the strong roads—the Delaware, Lackawanna and Western, the Lehigh Valley, the Reading, and the Central Railroad of New Jersey—taking more than their share. The result is that the mines reached by these companies work more days in the year than the other mines. Moreover, the mines owned by the railway companies are favored as compared with independent mines. This entire system of apportionment is unjust. The limitation, if any, should give all an equal amount of work during the year. Attempts of the independent coal producers to ship coal on their own account are largely prevented by the alleged inability of the railways to furnish cars. The railways are able to force the independent producers to accede to their terms, since they can cut prices for coal which they produce, while keeping railway rates high enough to earn a profit to offset the loss on coal. The independent producers are also practically forced to adjust the wages which they pay their men to those paid by the railway company mines. There has been no reduction in the rate of transportation for some years, and this rate, which amounts to about 10 mills per ton, is so much higher than that for bituminous coal, which averages about 2½ mills per ton, that the anthracite producers are greatly hampered in competition with soft coal. The railway companies have kept the profits of mining so low by their high rates of transportation that they have succeeded in buying coal lands very cheap. Nevertheless, their holdings of unimproved coal lands are so great that their business frequently shows a loss, owing to the heavy fixed charges—royalties, interest, and taxation of these lands. (152-157.)

Mr. Brooks asserts that railroad mines are unjustly favored in the distribution of cars, and that in consequence they are able to run a much larger part of the time than the independent mines. For instance, two collieries of his own on the line of the Delaware and Hudson were able to run only 108 days in a year while the Delaware and Hudson collieries themselves averaged over 200. (155.)

Mr. MARCY says that he has never sold his coal to any railroad company. He has no knowledge of the contracts of other operators with the railroads and has never cared to know about them. He has never been asked by a railroad to sell it his coal, and has never felt any pressure from the railroad companies. (664, 670.)

Mr. LOOMIS, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, says that there are tariff rates on coal, varying with each station, and that these regular rates are charged to his department on its shipments. He thinks the railroad buys the greater part of the coal of the independent operators on its line. From some it buys their entire output and from others only a part. Mr. Loomis understands that the general form of contract is such that the independent operators receive a certain percentage of the price of their coal at tide water. On some sizes he understands that they receive 60 per cent and on others 40, the remainder in each case going to the railroad as pay for hauling. Mr. Loomis has never heard any complaint of discriminations between large shippers and small shippers or against independent shippers. (659, 660.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company has leased some few tracts to individual operators. Some of the leases provide that a certain proportion of the coal shall go to the Coal and Iron Company, and some provide for the payment of a royalty. In a few cases, one of the conditions is that the coal shall be sold to the Coal and Iron Company at an agreed price at the mine. "We have not many leases in our territory; not many individual operators; very few. They all starve to death early."

The individual operators ship some 15 or 20 per cent of the coal that goes over the Reading road. Not all the individual operators are lessees. Mr. Luther is not familiar with the contracts under which his company takes the coal mined by the individual operators, but his impression is that the operators get 60 per cent of the price of the coal and the company 40 per cent. The operators are very glad to have the company take and handle their coal. It may be that the Reading Railroad would be able to virtually force the operators into such contracts, but he has never seen it done and never seen it tried. The leases provide for the shipping of all coal mined over the Reading road. There are, however, one or two lessees that ship over two or three roads. (649-651, 653.)

Mr. MARCY says that he has always been fully supplied with cars, because he has three railroads to draw from. He has occasionally had trouble for a short time because of special reasons, but not because of any discrimination. (667.)

Mr. LUTHER says that he has never heard any complaints in his company's mining region about the distribution of cars between the different interests. The cars in sight are divided among the several operators according to their estimated capacity. Every individual operator's colliery is rated upon its capacity to produce, by an officer of the Coal and Iron Company, who is a skilled miner appointed for the purpose. When an operator thinks that he has developed sufficiently to warrant a rerating, he asks for it. On the basis of the rating the railroad company distributes the cars. The railroad always leans toward the individual operator to avoid any accusation of partiality to the Coal and Iron Company. When the Coal and Iron Company is running broken time, the independent operators run more steadily, and their proportion of shipments over the Reading road runs up from 15 per cent to 20 per cent, and has been known to go as high as 25 per cent. They are furnished cars enough to make this possible. (649-652.)

4. *Attitude of independent operators and of railroads toward labor.*—Mr. MITCHELL, president of the United Mine Workers, says that the coal companies controlled by railroads in the anthracite coal field are much more reasonable in their treatment of labor than the individual or independent operators. He attributes this fact, however, to the pressure upon the independent operators from the railroads, which charge them excessive freight rates, so that their profits are ground down.

Mr. MARCY, an independent operator, asserts that conditions in the railroad mines and in the independent mines are substantially the same. (670.)

G. Profits of coal mining.—Mr. DALZELL, president of the Illinois Coal Operators' Association, says that in 1872 the earnings of capital engaged in coal mining in Illinois were large. In one mine it was stated that the profits were \$50,000 to \$60,000 per year on 50,000 to 60,000 tons of coal mined. Almost any other business or investment, however, would have paid better than the coal business during the past 10 years. This has been due in part to losses by strikes, and in part to the excessive competition. The cost of mining in Illinois is relatively high. (105.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that 30 years ago the coal business was not overdone, and 20 per cent was a fair profit on investments. Now the profit ranges from 15 per cent to zero; in many cases there is no profit, or a loss. The difficulty is due to overproduction and to undue competition between local operators and between different districts. The practice of buying coal lands in advance in large quantities, with a view to insuring the possibility of future production, involves a large investment of capital with little immediate return, and is injurious to operators. (84.)

Mr. ROBINSON, a West Virginia operator, says that coal mining in West Virginia has not been so successful as various other lines of business. With few exceptions mines have changed hands several times through failures, which may, however, be mainly attributed to ignorance. The amount of capital invested in the Kanawha district is about \$1,500,000; in the New River district, \$3,500,000. Companies seldom have a large capitalization and are not overcapitalized. Stock is not divided into classes or sold on the market. (5, 8.)

Mr. BROOKS, an anthracite operator, intimates that the average profits of capital invested in mining are from 5 to 7 per cent, though they vary greatly at the different mines. Occasionally extreme cutting of prices destroys the profits. (162.)

H. Taxation of coal mines.—Mr. DALZELL, president of the Illinois Coal Operators' Association, says that in certain parts of Illinois the local assessors, who have complete control of the methods of assessment, have sought to assess the value of coal in undeveloped territory, often working great injustice on the owners. It is the practice to buy the right to mine coal in advance, but, before actually opening the mines, to buy the surface also. It is unjust to assess coal before the mines are opened up, because there is no way of knowing whether there is any coal in the ground, or

what its value is. As to personal property, machinery, etc., the assessors are likely to make purely arbitrary assessments, often very largely in excess of the true value. A recent law, however, provides that the personal property shall be valued by the owner himself, and the assessment fixed at one-fifth of the true value. (111, 112.)

Mr. Brooks, an independent anthracite operator, says that there is in Pennsylvania a business tax, apparently on operated mines, which amounts to about \$2,000. Besides this the local assessors assess undeveloped coal lands, using very different methods in different counties. Sometimes the basis is the estimated thickness of the veins of the coal. (157.)

I. Prospect of exhaustion.—Mr. MARCY, an independent anthracite operator, says that anthracite exists only in small areas, and that another 50 years at the present rate of consumption will, in his opinion, nearly see the end of it. (667.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that though he knows of no definite scientific information on the subject, he is inclined to believe that at the present rate the coal of the Pittsburg vein, which extends over a territory about 50 miles square, will be exhausted in 75 years. The coal in other counties and in different veins is likely to last longer. (82.)

J. Prices.—Mr. LOOMIS says that there is no regular price for coal in the mining regions. There are many competitors. Prices range from 70 cents to \$2 for the various sizes. (662.)

Mr. MARCY states that his net returns for coal range from 32 cents for No. 2 coal up to \$2 and \$2.25 for the more valuable sizes. For the month preceding his testimony (February, 1900) the returns were \$2.37 for stove coal, which is the size that brings the highest price. That is exceptional. During the preceding year he had received from \$1.97 to \$2.10 for this size, and \$2.06 or \$2.07 had been the average price of it. (666, 667.)

Mr. MULLINS, an Ohio operator, says that the average cost of production of coal in the Massillon district is about \$1.05 per ton, while the average selling price at the mines is \$1.30. This, however, does not represent a net profit of 25 cents per ton. The transportation rate to Cleveland is 60 cents, and coal is sold there at \$3.15 per ton. The retailer must receive from \$1 to \$1.10 on each ton in order to pay for his hauling, expenses, and profits. (169.)

K. Foreign markets.—Mr. SCHLUEDERBERG says the coal operators will be driven by excessive competition to seek foreign markets. Mexican and South American points especially should be supplied with American coal, instead of English, as at present. (88.)

V. CONDITIONS OF LABOR IN EASTERN AND CENTRAL COAL MINES.

A. Coal-mining machinery.—Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, says that where mining machines have been successfully introduced the number of miners has been somewhat decreased. In Illinois the miners have opposed the machines, claiming that they could make better wages at pick mining, even though the differential as against machine mining has been somewhat reduced. For this reason the machines have not been used at all in the northern part of Illinois, though they are used in the southern and the central part of the State. The machines work more successfully in the thicker veins. (684.)

Mr. Ross, secretary of the Illinois Bureau of Labor Statistics, considers the improvement in machinery one of the chief causes of the increase of coal miners' wages during the last 30 or 35 years. (185, 186.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that the conditions are such in northern Illinois that machinery can scarcely be used in coal mines, but, the witness believes, where it can be used it is ultimately an advantage both to the employers and to the miners; at least to a large majority of them. (114.)

Mr. MULLINS, an Ohio operator, does not employ machinery. In fact, in the Massillon district the character of the coal is such that it is not undercut for the most part, and machines are intended primarily for undercutting. The witness has found on investigation that machines are economical only when the price of mining by hand is relatively high. They then save, he has been told, from 12 to 21 cents per ton. They necessarily displace many miners. The recent competition of West Virginia has had a strong influence in leading the Ohio operators to introduce machinery. (177.)

Mr. ROBINSON, a West Virginia operator, states that machinery is being used somewhat in West Virginia. It results in some economy, but the chief advantage is in

the greater steadiness of production, since under the system of hand labor paid by the amount mined the workmen often worked irregularly. (9, 10.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that when machinery was first introduced it gave an advantage of probably 15 cents per ton; but, by reason of overproduction, the advantage is now only about 8 cents per ton as compared with hand mining. The mining machine does the undercutting of the coal. Six men are required to operate the machine and load the coal from it, and they can produce as much as 10 men working without the machine. Nevertheless the witness believes there has not been much displacement of labor by the machines, because of the increase of production and the employment of engineers, firemen, etc. More coal is produced, but not fewer men employed. Nearly all mines in the Pittsburg district employ machines. (87, 88.)

Mr. MITCHELL, president of the United Mine Workers, states that machinery is being increasingly introduced; probably 40 per cent of bituminous coal is being mined by it. It depresses wages, especially reducing the proportion of skilled labor, since only the actual drilling and cutting with the machines is done by skilled labor. Miners' organizations do not oppose machinery, but recognize its injurious effect upon themselves. Electric machines are replacing compressed air. The coal mined by machinery is about the same in quality as that mined by hand, where the undercutting is properly done. (54-56.)

Mr. PEARCE, secretary of the United Mine Workers, says that the introduction of machinery into coal mines has largely displaced labor, and yet no one can object to improvements of this sort. The increased demand for coal has continually kept up or often increased the number of miners, despite the saving of labor. Where 100 men would be required to work with the pick, about 60 would be sufficient with machinery. (102.)

Mr. DAVIS, vice-president of the United Mine Workers, says that the introduction of machinery into coal mines has cheapened production, but has not especially increased profits, since excessive competition has given the benefit to the consumers. The witness makes a rough estimate that from 30 to 50 per cent of the employees have been thrown out by machinery, but admits that the entire number of employees in coal mining has been greatly increasing, and perhaps even as rapidly as the output. (136.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, states that the machinery used in the anthracite region is principally used for the preparation of coal. Very little is used in mining. Machine cutting as practiced in the bituminous regions is not practicable in the anthracite mines. It would be hard to run those machines on a pitch of 65 or 70 degrees. (651.)

Mr. JAMES says that machinery can not be used on a large scale for mining anthracite coal, although each miner has a drilling machine. But on the coal breakers new machinery has largely replaced the labor of boys in preparing and cleaning coal. (150.)

B. Wages and employment.—1. *Intervals of payment.*—Mr. MITCHELL, president of the United Mine Workers, says that miners favor weekly payments because provisions and supplies can be bought cheaper for cash, and because miners are thus less under the control of the employer. Formerly employers paid only monthly, and always retained half a month's earnings at the time of payment. The present agreement with the United Mine Workers is for semimonthly pay. (41.)

Mr. PEARCE, of the United Mine Workers, says that bimonthly payment has been found a great improvement over monthly payment, and weekly payment would be still more desirable, especially since it would enable the miners to buy for cash, and would make them more free from the company stores. (96.)

Mr. DAVIS, vice-president of the United Mine Workers, says the miners have found semimonthly payment much more advantageous than monthly payment, and the employers do not appear to have suffered by the change. As it is, the employers hold back from 10 days' to 2 weeks' wages. Weekly payment would be still more beneficial, especially as it would enable the miners to buy for cash instead of on credit, and would make them more free from the company stores. The desire of the employers to compel the miners to patronize the company stores is one of their chief reasons for opposing weekly payments. Frequent payments do not tend to increase dissipation or prevent savings. Miners in any case have not enough money to dissipate very violently. (132.)

Mr. JAMES, of the United Mine Workers, states that a law was passed in Pennsylvania requiring employees to be paid semimonthly "on demand." It was found that those who demanded their wages semimonthly were given no more work; at least, so the witness has been told. The monthly payments are preferred by the

operators because the miners are thus practically compelled to deal with the company's stores, where they are charged excessive prices. The miners favor weekly payments, which would make cash purchases possible. (143.)

Mr. Brooks, an anthracite-coal operator, says that anthracite operators adopted the semimonthly system in accordance with the Pennsylvania law, but the majority, including the witness, prefer the monthly payment. The class of laborers found in the mines, especially those from southern Europe, are accustomed to many holidays and make it a practice to take from 1 to 3 days off when paid. The witness believes that they would do the same if paid frequently. (158.)

Mr. Loomis, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, says that his company pays its men in cash monthly. (663, 664.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company pays its miners in cash twice a month. (652.)

Mr. MULLINS, an Ohio operator, says the Ohio law requires payment semimonthly. The witness considers this system satisfactory where the miners, as in Ohio, are of a high class, but it would be injurious where they are inclined to dissipation and idleness. (167.)

Mr. DALZELL, an Illinois operator, says that the weekly-payment law passed in Illinois was held unconstitutional by the courts as interfering with the right of free contract. The witness considers weekly payments undesirable, because of the labor required in making up elaborate pay rolls. Even under the semimonthly system of payment this work is found to be very difficult. In the witness's mines the payment is regularly 2 weeks behind time; that is, work done during the first 15 days of the month is paid for on the Saturday nearest the first day of the succeeding month, etc. A further difficulty with frequent payments is that the men do not or can not work full time on the day when they are paid, although, in the witness's mines, where the 8-hour system prevails, work is closed at 3.30 and payment made after that time. Moreover, the miners are often unfit for work on the Monday after pay day; Mr. Dalzell's mines are not able to work at their full capacity on that day. The main purpose of the miners in urging weekly payments is to secure payment for work done more nearly up to date of payment. (109.)

Mr. Ross says that the weekly-payment and company-store acts of Illinois have been declared unconstitutional, but that through the agitation in connection with the laws the miners have since been able to obtain concessions by agreement. Wages are for the most part paid weekly. The witness thinks that frequent payment is better for the employees, that it does not increase drunkenness or loss of time, and that it does not work any special hardship to employers. (183-185.)

Mr. ROBINSON, of West Virginia, like most operators, pays wages monthly, which is most convenient because coal sold is settled for monthly, and which is satisfactory enough to good workmen. (17.)

Mr. STEPHENSON, of the United Mine Workers, says that the West Virginia law requires payment semimonthly, but it is not enforced, and payment is regularly made by coal operators monthly. In other States miners are usually paid semimonthly. Weekly payment does not increase drunkenness. (23.)

2. *Amount of employment.*—Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, says that the number of days of work which the miners have been able to obtain in the years since 1898 has been considerably greater than during 1894, 1895, and 1896. There has been a general expansion in the bituminous-coal trade. (684.)

Mr. Ross says that it is estimated that the mines of Illinois, if run at full capacity, could produce about 45,000,000 tons of coal yearly, which is 26,000,000 tons more than they have ever been able to find a market for. The average duration of employment in coal mines is only from 175 to 180 days. (186, 189.)

Mr. MITCHELL, president of the United Mine Workers, says that the capacity of all the coal mines in the country is 33 to 40 per cent greater than the annual consumption. In 1897 the miners worked, on an average, 179 days and produced a little over 200,000,000 tons. They could have produced 100,000,000 tons more. It was in order to check production and raise prices that the strike of 1897, lasting 84 days, was inaugurated. (36.)

Mr. ROBINSON, a West Virginia operator, says that the capacity of all mines in the country, if in steady operation, would probably exceed consumption 25 to 30 per cent. The recent increase of exportation to foreign countries, especially South America, is relieving overproduction. West Virginia coal is of specially high quality, well fitted for long shipment and for competition with other districts. The production of the State is increasing more rapidly than that of any other. About 16,000 square miles are underlain with coal, mostly undeveloped. The average number of days worked in mines ranges from 197 to 229. (5, 10, 11.)

Mr. DAVIS, of the United Mine Workers, says that on account of the excessive capacity of the coal mines the number of days employed is very low. In 1897 200,000,000 tons were produced by working an average of 174 days out of 306 possible working days. Had the full number of days been worked 370,000,000 tons would have been produced, while the greatest amount ever sold in a single year was only 212,000,000 tons. In the anthracite trade the average number of days worked was only 150. The average number of days of employment for coal miners from 1890 to 1893 was 204; from 1894 to 1897, only about 100. (126, 127.)

Mr. PEARCE says there is an overproduction or an underconsumption of coal, so that there are almost one-third more miners than are necessary. Irregularity is also caused by seasonal conditions, employment being best in some districts during the winter and in others during the summer. The use of natural gas has interfered somewhat with mining, and so also has the introduction of machinery into mines. (99, 100.)

Mr. McKAY, of the United Mine Workers, says that in coal mining the changes in lake and river navigation affect employment considerably, more men being employed when those methods of transportation are open. The witness believes at times the beginning of lake shipments is delayed by the operators for the purpose of securing lower rates of wages for a year. (69, 70.)

Mr. MULLINS, an Ohio operator, says that the steadiness of employment varies greatly in the different districts of Ohio. The average is hardly more than 200 to 225 days per year. (167.)

Mr. JAMES, of the United Mine Workers, says that the number of miners in the anthracite mines is greatly in excess of the required number, and the average time of working is only 150 days per year. At present the output from each mine is limited by the operators association. The miners frequently work more than the number of day necessary to supply the amount fixed, working while the machinery and outside workers are idle. The witness believes that this practice is unjust to the outside workers. (144, 149.)

Mr. BROOKS, an independent anthracite operator, says that the various railway companies which enter the anthracite fields have agreed among themselves on the proportion of the total output which shall be hauled by each company. This practically results in fixing the amount of coal which shall be produced by the mines reached by each company, and consequently the number of days which the mines shall operate. The proportions as between the different roads are not fairly fixed, and consequently the mines reached by some of them work many more days in the year than others. Some mines work as many as 250 days, others only 100 days per year. The mines owned by the companies themselves are often allowed to work longer than those of independent operators. Thus the witness was able recently to work at 2 mines reached by the Delaware and Hudson Railway only 108 days in the year, while the mines owned by the railway averaged over 200 days. Miners tend to leave mines which are working the fewest number of days and go to those where there is more work, so that the former have difficulty in securing enough labor. The witness believes that the amount of coal produced by each district should be determined on the basis of the number of employees, so that all should work practically the same length of time, not arbitrarily according to the tonnage to be hauled by the railway companies. (153-155.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that the working day, for the purposes of wages, is regarded as 10 hours for all employees of his company that work by the day. For the last 2 or 3 years, however, even when the company has worked what has been called full time, 6 days a week, the working hours have been only 9 a day. During the last 2 or 3 years, or a large part of the time, the mines have not run full. In 1899 they began to run full about the 1st of August and continued until the latter part of January, 1900. From that time on they had been running, at the time of Mr. Luther's testimony, March 9, 1900, from 3 to 5 days a week. (645, 650, 651.)

Mr. Luther gives the number of so-called "breaker days" worked by his company since 1894. These are 10-hour days, and the number is obtained by dividing the whole number of hours worked in the year by 10. The average number of full days worked was, in 1894, 180; in 1895, 189; in 1896, 176; in 1897, 132; in 1898, 141; in 1899, 158. The last two of these years are years ending June 30, in consequence of a change of the fiscal year of the company. Mr. Luther can offer no explanation of the decrease of working days during the last three years, except the want of demand for coal. He declares that he has no knowledge of the prices of coal to the consumer, and consequently can throw no light upon any connection between prices and demand. He does not think it would be possible to "find a coal operator that will admit that prices ever got too high." The demand for anthracite has gradually

increased, upon the whole, from year to year, but not, he thinks, in the same proportion as the supply. (646, 651.)

Mr. LOOMIS, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, says that he only mines coal to fill the orders he receives from day to day from the sales department. The company has no facilities for stocking up. (663.)

3. *Docking.*—*Bituminous mines.*—Mr. PEARCE, of the United Mine Workers, says it is a common practice, which often leads to injustice, to dock the pay of miners where the coal loaded is inferior in quality. Thus, there is a vein of coal in Ohio, 8 feet thick, of which nearly half is composed of impurities. If a small quantity of these is accidentally placed upon the load, the miner may be docked for the entire load. The miners' organizations themselves strongly oppose loading of worthless coal, and in some instances have expelled men for doing so. Miners seldom load impurities willfully. (92, 93.)

Mr. MITCHELL says that deductions from wages are often made in mines for loading unclean coal, frequently more than should be deducted. The United Mine Workers have rules against loading unclean coal, and will sanction discharge for repeated offenses. (44.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that miners are required by their employers to load clean coal—that is, not to put in any slate or other impurities. The witness does not believe in fines and dockage, since they do not benefit the operator, but cause bad feeling. Where a miner loads unclean coal in the witness's mines, he is simply warned, and if still careless, is laid off. (80.)

4. *Docking.*—*Anthracite mines.*—Mr. BROOKS, an anthracite operator, says there is always considerable friction between miners and operators regarding docking for impurities in coal. Each side maintains that the other is wrong. The docking system is necessary to prevent some miners from careless work. Sometimes men are suspended for loading unclean coal, and occasionally the fault is not their own, but that of the assistants who load the coal. (162.)

Mr. JAMES, of the United Mine Workers, says great injustice is caused to anthracite miners by the docking of coal for impurities—slate and "bone." In some mines there are two docking bosses, one below ground and one on the breaker. The witness has sometimes been docked as much as 2 cars out of 4. He has been docked full cars when he was positive that there were not 25 pounds of impurities in the car. Alleged impure coal is dumped in the same chute with other coal. Docking bosses have told Mr. James that they were instructed to dock by the companies. One docking boss acknowledged to him last year that he had acted unjustly in docking the witness. A statement of the number of cars mined by and the number docked from certain miners of the West Ridge Coal Company, of Scranton, show as high as $7\frac{1}{2}$ cars docked out of 57 mined, the lowest proportion being $1\frac{1}{4}$ out of 67. The total shows 144 docked out of 1,750. Demands of the miners to have judges of docking have been refused. (144, 146.)

Mr. MARCY, an independent anthracite operator, says that he has had car after car come out with from 1,200 to 2,200 pounds of rock topped off with coal. In such cases he simply warns the miner to do better. Often the miner's car is stopped two or three days. If he continues, and it is not an especially bad case, he may be notified a second time, but never a third time. (669.)

Mr. VERTH, a mining superintendent of the Reading Coal and Iron Company, says that his company never docks its men. If a man mines dirty coal, he is warned twice, and at the third offense he is discharged; but he is paid in full for what he has mined. (656, 657.)

5. *Screens.*—Mr. SCHLUEDERBERG, a Pittsburg operator, says that in the early days in the Pittsburg district coal was taken as it came from the miner; but some man foolishly introduced the practice of handling it over with a pronged fork, and afterwards screens were introduced gradually, in the hope of securing trade which belonged to others, until finally they became universal. The screens are now necessary in order to retain markets, and interference by legislation is injurious to operators. Thus when, in 1874, Pennsylvania passed a law requiring $\frac{3}{4}$ -inch screens, instead of $1\frac{1}{2}$ inch, the operators gradually lost their markets. The Pennsylvania law of 1897 requiring coal to be weighed before screening was held to be unconstitutional, because it took away the right of free contract. The employers object to such a law because the miners are less careful to secure good coal. They have found that under the normal conditions 64 per cent of the coal mined is lump coal; but this proportion ran down, when the screens were taken away, to 55 per cent or less. It is an incentive to the miner to work carefully when he is paid on the proportion of good lump coal secured. The witness does not admit that the miners are not paid for the coal that goes through the screen, since the prices have been adjusted so that

the rate at the run-of-mine system, 42½ cents, and that where screens are used, 66 cents, are practically the same. In central Pennsylvania and in Illinois, where the coal is softer and can be marketed without screening, the run-of-mine system prevails, but it is not feasible in the Pittsburg district. In the earlier days there was less slack mined than at present. It was considered practically worthless and was left in the mine, where it constitutes mostly the lower part of the vein; but by improved processes of combustion this slack can now be satisfactorily burned, while by the use of machinery it is easily and economically mined. (83, 86.)

Mr. MULLINS says that the run-of-mine system would tend to make miners more careless in loading refuse matter, slack, etc. He maintains that under the system of screening the miner is really paid for all the coal, since his wages are adjusted according to the proportion which goes through the screen. Nevertheless this proportion is sometimes fixed arbitrarily and not by experience. The law of Ohio recently passed requires payment to be made on the basis of run-of-mine coal. Its constitutionality is being tested, and meantime the miners have held by their contract for the screening system. The difficulties caused by screens have been exaggerated. There was in the Ohio district little complaint on the subject of screens until recently. The witness believes, however, that the size of screens should be regulated by law, with adjustment as to wages based on the proportion of coal passing through the screen in different districts. It is the duty of the check weighmen appointed by the miners to watch and see that the screens are kept in repair, so as to work fairly. The price of nut coal in Ohio is usually about 40 to 50 cents less than that of lump coal, and pea coal 15 cents less than nut coal. The difference is not so great in the Massillon district. Nut coal is little used for domestic purposes in Ohio, and the operators find difficulty in disposing of it. (175-177.)

Mr. DAVIS, of the United Mine Workers, believes that the run-of-mine system is fairest, and that screens should be used only after the miners have been paid, for the purpose of preparing coal for the market. The miners' organization has been forced to waive this principle and to accept different prices for screened and unscreened coal. (135.)

Mr. PEARCE admits the necessity of separating coal into different grades in order to satisfy the demands of the market. He believes that in Ohio screened coal brings about \$1 per ton at the mines; nut coal, which passes through the screen, 75 cents, and pea coal about 50 cents. He has heard of a case at Sandusky, Ohio, where 25 cents per ton more was paid for nut coal than for lump coal. The operators experimented several years ago and found that where coal was screened the amount produced was ⅔ of the amount of run-of-mine coal, and prices for mining were adjusted on that basis. But there are cases where from 30 to 40 per cent of the coal goes through the screen, and in some instances the employers profit the more by the greater amount going through. In Illinois the run-of-mine system is employed, and operators and miners alike agree that it is an improvement. Miners do not willfully load impurities and slack, and their organizations take a definite position against doing so. The impurities which injure coal the most are lumps of sulphur, which occur more in the large lumps of coal than in slack. Difficulties are frequently caused by screens getting out of order, the bars spreading or otherwise letting more coal through, while the operators refuse to repair them. The usual screen is 12 feet by 6, with a space of 1¼ inches between the bars. Laws regulating screens have been uniformly held unconstitutional when tested in the courts as interfering with the right of free contract. (92, 94.)

Mr. DALZELL states that the Illinois law requiring coal to be weighed before screening was held unconstitutional as violating the right of free contract; but the miners themselves, through the strength of their organizations, secured the adoption of the run-of-mine system in 1897. This was one of the demands made during the great strike of that year, and was not yielded voluntarily by the majority of operators. The proportion of coal passing through the screen in northern Illinois is estimated at from 14 to 17 per cent. The witness believes that the run-of-mine system puts a premium on careless labor. The better men were better off under the screen system. The effect of the screens depends on the condition of the coal. (108, 115.)

Mr. ROSS also testifies that, though the screen law of Illinois was held unconstitutional, the miners have been able to secure an agreement with their employers to adopt the run-of-mine system. He states that system has worked very satisfactorily. (181, 183.)

Mr. JUSTI, commissioner of the Coal Operators' Association of Illinois, declares his belief that the run-of-mine system, if the miners take care to load coal properly, will in the end make better miners and be more satisfactory to all parties. As yet there is considerable complaint in Illinois that miners become careless as to the quality of the coal which they load. Mr. Justi believes that it is the earnest desire of the officers of the miners' organization to enforce the provisions of the joint agreement,

requiring the miners to be careful as to the loading of coal. The operator, under these agreements, has the right to discharge careless miners. (680.)

Mr. MCKAY states that the screen law in Pennsylvania was held unconstitutional, and difficulties concerning screens, due to their intricacies and to changes made by the operators, are frequent and often cause strikes. The screen is the greatest evil the miner has to contend against. By custom or agreement the usual screen has a surface of 72 square feet, with flat bars $1\frac{1}{4}$ inches apart. The special commission appointed in Pennsylvania about 1897 is reported that there were many injustices; e. g., the screens used by H. K. Wick were 80 square feet in surface, and the bars, diamond shaped, were $1\frac{3}{4}$ inches apart. It is estimated that the average amount of coal passing through screens is 39 per cent of the total. Much of the nut coal going through the screen is practically as good as lump coal and brings as good a price. Slack brings very much less. Miners would be willing to deal for the adjustment of prices according to the screens used. The present prices are 42.66 cents for run-of-mine coal and 66 cents for screen coal. (64, 68, 70, 71.)

Mr. ROBINSON says that the West Virginia law requiring coal to be weighed before screening is practically not enforced, the supreme court of the State being equally divided as to its constitutionality. Screens are not made a means of reducing wages, but the employer, having decided what size of coal he wishes to market and having adopted screens accordingly, fixes a scale of wages adapted to the amount a miner can produce using that scale. Such careful screening is necessary, especially in coal intended for domestic use. The system does favor good miners who care to bring down coal in large lumps. The screens used vary from $1\frac{1}{4}$ inches to 2 inches in opening. In some cases 4-inch screens are used, but payment is then by run of mine. Screenings of coal sell for about 25 cents a ton. (13.)

Mr. STEPHENSON states that the law requiring operators to weigh coal before screening was held constitutional by two judges of the supreme court and unconstitutional by two, and is practically not enforced. In the New River district, however, the run-of-mine system prevails. The United Mine Workers have offered to reduce the price of mining in order to secure a uniform run-of-mine system. This latter system does not usually encourage "dirty mining." In the Cincinnati market screened coal brings 7 or 8 cents a bushel and nut coal and slack 4 cents a bushel. (28, 30.)

Mr. MITCHELL, president of the United Mine Workers, stated, in July, 1901, that the strength of the labor organizations in the bituminous mines had greatly reduced the evils of the screening system and of the dockage of coal. These evils still exist where the miners are less strongly organized. (699.)

6. *Check weighmen.*—Mr. SCHLUEDERBERG, a Pittsburg operator, says there should be on each "tipple" a check weighman; as a matter of fact there are few mines in the Pittsburg district where they are not found. They should be somewhat more careful not to interfere with the running of the mine in the exercise of their duties. (88.)

Mr. DALZELL, an Illinois operator, does not believe that employers seek to cheat the miners, but believes that the employers should themselves insist that the miners employ check weighmen, because it satisfies them that they are being fairly treated. (115.)

Mr. ROBINSON, a West Virginia operator, says that miners are allowed to employ check weighmen and frequently do so. He has never known an instance of refusal by an employer to allow check weighmen. (13.)

Mr. MULLINS, an Ohio operator, says it is much more satisfactory to the operators to have check weighmen than not. Sometimes, however, these check weighmen make unnecessary trouble in exercising their duty. (174, 175.)

Mr. MCKAY, of the United Mine Workers, says that although operators allow the miners to appoint check weighmen to test scales, they frequently restrict the opportunity to test scales to particular times, while scales can often be doctored with a touch. One operator was sent to prison for fraud in weighing. In the coke region it is the custom to measure instead of weighing coal, which is apt to cause injustice. Operators often require the wagons to be heaped up, although that gives an excess of weight. (72, 73.)

7. *Contract mining—anthracite.*—Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that the mining work is done by contract, and that the price for each piece of work is arranged by negotiation between the superintendent and the miner. The price is arranged according to the conditions. Sometimes a miner refuses to accept the price proposed. In that case he is free to go to another colliery, or he may stay in the same colliery and take some other work. If the conditions turn out to be different from what they seemed to be, the terms of the contract may be altered, either to give the miner more or to give him less. The contracts are verbal, and there may sometimes be mistakes about them, but if so they are rectified. (654, 658.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that the laborers, as distinguished from miners, are paid by the day, and that miners are paid by the day for certain kinds of work, but that the actual mining of coal is universally done on contract. The terms of the contract vary with the conditions of the particular spot. Where the veins are large and lie upon a considerable incline payment is made by the linear yard. A miner takes a contract for a certain room. The rooms are usually about 100 yards long. A room may last a miner 2 or 3 months or it may last him 6 or 8 months. When a particular contract of this sort is executed, a new contract is entered into. (645, 647, 648.)

Mr. LOOMIS, superintendent of the coal mining department of the Delaware, Lackawanna and Western Railway, says that his company pays its miners by the car. The rates are different in different mines and in different veins. It is practically a matter of individual contract with each miner. (659.)

Mr. MARCY says all his mining is done by contract. Coal could not be mined any other way. If it were necessary to look after so many laborers in different rooms and in the dark, one would need to have more foremen than men. Mr. Marcy's prices per car are uniform. (668, 669.)

8. *Rates of wages* (see also *Joint agreements—effect on wages*, p. CXXXVI).—Mr. DAVIS, vice-president of the United Mine Workers, says that from 1865 to 1868 the wages of coal miners tended downward. Since then this tendency has been checked by labor organizations, but wages have scarcely been raised. Since 1894 there has been a downward movement. (134.)

Mr. PEARCE, secretary of the United Mine Workers, says that the tendency of wages during the last 15 or 20 years has been downward, but it has been checked recently by the strong organization of the miners. There has been an increase of about 20 per cent in the past 2 years. Nevertheless the miners are scarcely able to save anything, as their wants are constantly increasing. (99.)

Mr. ROSS says that the result of the suspension of production in the coal mines during 1897 was a marked increase in wages, which have been maintained at a higher figure ever since. The average increase in Illinois has been about 30 per cent, in the Springfield district about 36 per cent, and in some other sections still more.

Generally speaking, wages have risen materially during the past 30 or 35 years, their purchasing power especially increasing. Organization of labor and improvements in machinery have been the chief causes of this increase. (185, 186.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that wages are not as high in Illinois now as 10 years ago. Then he paid 82½ cents per ton in summer and 90 cents in winter for screened coal. His present rate is 63 cents for run-of-mine coal, the amount of screened coal being from 14 to 17 per cent less than that of run-of-mine coal. The vein of coal in northern Illinois is only about 3 feet 8 inches thick, and that about one car of rock must be hoisted to every 5 or 7 cars of coal. Shafts and roadways must be heavily timbered, although the mines are dry and dusty, and free from gas. Owing to these conditions the wages of miners are higher than in more eastern States, and the cost of production is also higher. There are considerable differences in conditions in other parts of the State, and wages for mining are adjusted accordingly. The operators who form the Illinois Coal Operators' Association appointed a committee in 1897 to fix fair differentials in mining prices for the 9 different districts which were established. Afterwards the miners met the operators in State convention and agreed to the different prices proposed by the operators. The basing point for the different prices was made in the Danville district, with which prices for Eastern States are compared. The prices throughout Illinois are higher than in Eastern States, owing to the relative thinness of the veins and the greater difficulties of mining. The rate in northern Illinois is 63 cents for run-of-mine coal, which is estimated to be worth 16 or 17 per cent less per ton to mine in that State than screened coal. The witness believes that the relative rates for the different districts are now fairly adjusted, so that they are on an equality in competition. The miner can produce on an average over 3 tons of coal per day. Mr. Dalzell believes that the employers make more profit when they pay high wages than low wages, but apparently does not consider this to be a direct cause and effect, but rather believes that at times when the demand for coal is good and trade prosperous, high prices can be and are paid for mining. (105, 107, 121, 122.)

Mr. MULLINS, an Ohio operator, states that the average rate of wages in the coal mines of Ohio is about \$1.75 per day, but in the Massillon district it is about \$1.90. The miners, as a rule, do not work over 200 to 225 days per year. Under the best conditions they could thus earn about \$390. Wages are lower by about 12 per cent than they were 15 years ago. The witness considers wages to be too low to be satisfactory to the miners, but that fact is due to the low selling price of coal. (167-169.)

Mr. MCKAY, of the United Mine Workers, says that as compared with 50 years ago

the wages in coal mining are considerably better to-day, but in the Pittsburg district they are lower than they were 17 years ago. At that time the rate was \$1.05 per ton; now, 66 cents. (69.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says that the wages of coal miners before the war in the Pittsburg district were about 40 cents a ton. After the war they rose to \$1.30 a ton in the depreciated currency. Later they fell to 78 cents, and now stand at 66 cents for screened coal and 43½ cents for run-of-mine coal. At this rate the witness believes that a miner who is fit to be in the business should earn not less than \$2. The average output of a miner is 2½ tons, but on no account ought he to mine less than 3 tons. From his receipts the miner must deduct about 10 or 15 cents a day for powder, squibs, repair of tools, etc. In West Virginia, where the unions have little influence, the rate of wages is lower and varies considerably in different mines. The witness has heard of coal being mined there at 33 cents per wagon; the contents of wagons vary considerably, but are often as high as two tons. (75, 80, 81.)

Mr. ROBINSON, a West Virginia operator, declares that operators are glad to pay high wages, and reduce them only when forced by necessity through low prices of the product. Rates in West Virginia are about the same as 15 years ago, ranging from \$1.25 to \$2. Prior to the late national strike, prices had been steadily decreasing and work was largely interrupted. (7-10.)

Mr. STEPHENSON, of the United Mine Workers, says that the average daily wage of miners in West Virginia probably amounts to \$1.25. A first-class miner will make possibly \$1.75. But work is so irregular that the average for the entire year is only about 75 cents. Fifteen years ago they could make \$100 to \$150 per month, but now usually not over \$40. Payment is by the amount mined, varying from 20 to 40 cents per ton, though the bushel is sometimes the unit of measurement. Prices for mining in other districts are higher, and have been advanced 15 cents per ton within the last two years. The great strike of 1897 was intended to decrease the supply of coal and force up the price so that the mining rate could be made satisfactory. Prior to the strike it had fallen in the Pittsburg district from 79 to 54, and even 45 cents. (21, 24, 26.)

Mr. JAMES, of the United Mine Workers, says that miners in the anthracite region are paid partly by the car of coal and partly by the day. The wages paid by the Lehigh Valley Coal Company are 77 cents per car, containing about 2½ tons. For driving gangways the pay is \$4.22 per yard, for airways \$2.75 per yard, and for other particular classes of work special prices are fixed. The day wage for miners underground is \$1.98 for 10 hours' work, while laborers underground receive from \$1.10 to \$1.64. The workers on the breakers, etc., receive from \$1 to \$1.20. Firemen on the engines receive \$40 per month, and work 10 hours per day for one week and 14 hours every night for the next week, with no rest on Sunday. The witness has sometimes been able to earn as high as \$2.50 per day, but at other times not over \$1. At one of the best paying mines last year he earned \$404 in 240 days' actual work. He has within 2 years seen miners' families without shoes and without meat for a month at a time. (143, 144.)

Mr. James adds that the rate paid for mining anthracite coal varies materially in different mines. This is due in part to the absence of strong organization. The operators have made use of the sliding-scale system, which they have got under their own control, to fix wages to suit themselves, effecting the reductions at one place at a time. The inequality is promoted by the use of cars of different sizes. Thus, for cars of 80 cubic feet 85 cents is paid in certain mines, while for cars of 161 or 171 cubic feet only \$1.08 is paid. A standard car should be adopted. The miners are often required to heap up the cars, resulting in injustice. (144, 146, 151.)

Mr. BROOKS, an anthracite operator, believes that the requirements of heaping up the coal on the cars are usually fair to miners. A leveler is employed to show that the topping is 6 inches high. (162.)

Mr. Brooks states that the railway companies which enter the anthracite region themselves produce about two-thirds of the coal, and are therefore able practically to fix the rate of wages, since independent operators could not compete if they paid higher rates. The methods of payment and the rates vary greatly in different places. Thus, the thickness of the veins has much to do with it. Payment is sometimes by the day, sometimes by the ton or by the car. Cars vary in capacity from 1½ to 2 tons, and the price paid for mining them ranges from 75 cents to \$1.20. The miners in the Wyoming and Lackawanna regions have agreed among themselves not to mine more than 6 cars in a day. (155.)

Mr. MARCY pays by the car an invariable price. For a 77-foot car he pays \$1 and for a 66-foot car 85 cents. The 77-foot car holds about 2 tons. The gangway price, yardage, is fixed by agreement between the foreman and the individual miners. It varies with the thickness of the rock. (668, 669.)

9. *Amount of earnings.*—Mr. LOOMIS, superintendent of the coal mining department of the Delaware, Lackawanna and Western Railway, states that miners working for his company earn from \$2 to \$5 a day net. He has taken the names of from 6 to 12 men in each mine—good miners, poor miners, and average miners—and ascertained the actual money which they drew for a year. It ranged from \$500 to \$1,000 net, after deducting all supplies, including powder and coal. Each miner has usually an assistant, whom he himself pays. Mr. Loomis does not make it clear whether the amounts named by him as yearly wages cover the wages of two men, the miner and the assistant. (661, 663.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that the wages paid by his company for ordinary outside labor are on the basis of \$8.10 a week for a full week of 60 hours when coal is worth \$2.50 a ton at the shipping point. Miners receive \$2 a day for what is called common work, that is, work done by the day, on the basis of the same price of coal. The actual mining is all done by contract, but day wages and contract wages alike are governed by the sliding scale. An average miner ought to earn \$2.50 to \$2.75 a day under ordinary conditions, working by contract, and working full time. (646, 647.)

Of Mr. MARCY'S 120 or 125 anthracite miners, 23 per cent earn less than \$300 in a year, 47 per cent earn between \$300 and \$500, about 30 per cent from \$500 to \$800 and \$900, and some few \$1,000. This statement includes every man, whether he works an hour a day or more, whether he loads one car or more. Seven cars are supposed to be a day's work. The statement gives net earnings after making all deductions for powder, supplies, and oil. (667-669.)

If a man's wages are very low, it is because he does not work when there is work for him. Every miner in the anthracite regions would be able to support his family in comfort at present wages (March, 1900) if he were frugal and industrious. (667-669, 672.)

A living wage, says Mr. MITCHELL, is a sufficient amount to enable a workman to live as he should live, educate his children, and save enough for old age. Miners do not now usually receive a living wage. If all operators paid a living wage, there would be no loss, since it would fix the price of coal. Yet the increase in price, probably not over 20 cents a ton, would not involve hardship to consumers. The chief cost of coal to the consumer is in transportation. The cost at the mines in the United States averages 99 cents; in other countries about \$1.75. (41, 42.)

The production of bituminous coal in 1898, Mr. Mitchell continues, was 159,609,898 tons. Supposing the price of mining to be 50 cents a ton—a high average estimate—this would give for the 248,000 miners less than \$1.03 for each of the 306 working days. To the objection that many of the miners are employed only for a short time, witness replied that most of them work quite steadily. (57.)

10. *Sliding scale.*—Mr. SMITH, deputy labor commissioner of Colorado, thinks that the sliding scale system is eminently fair. It does not exist, so far as he knows, in Colorado. A minimum should be fixed below which wages should not go. He defines the living wage as that for which the mass of workmen are willing to live and work. The standard of living will vary in different places and at different times. (216, 217, 223.)

Mr. DALZELL, an Illinois operator, considers that sliding scales are scarcely practicable in coal mining, under ordinary circumstances, although he believes that some such system is employed in anthracite mining. (121.)

Mr. MITCHELL, president of the United Mine Workers, says that miners would favor the introduction of a sliding scale in wages provided a minimum were fixed. It has been used locally. The system exists in England. (41.)

Mr. DAVIS, of the United Mine Workers, says that the sliding-scale system was adopted in the anthracite coal region in 1868. The basis was fixed at \$3 a ton for coal, and miners, operators, and railways were to share equally in any advance or decline. Later the miners were denied representation on the board which fixed the prices from time to time, and the system became an injury to them, tending to bring wages down to the minimum. (133.)

Mr. JAMES states that in 1875 the anthracite operators fixed \$5 per ton at the seaboard as the basis for adjusting wages, and provided that the miners should receive one-tenth of any advance and lose one-tenth of any decrease in prices. The miners themselves have had nothing to do with determining what were the prices which fixed wages, and the operators have failed to advance, but have regularly reduced wages. Practically the sliding scale is now meaningless. The wages of anthracite miners have been greatly reduced in the past few years, and in the winter of 1898-99 they received no advance, although coal was advanced very much. Widely different wages are found in different mines. (146, 147.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and

Iron Company, says that all wages paid by his company, both day wages and contract wages, are governed by the sliding scale, which was established in 1875. It was arranged at that time between a committee of the men and Mr. Gowen, who acted for himself and the individual operators. The agreement was reached at the conclusion of a strike. It has been maintained continuously since, except that in 1888 it was changed temporarily by agreement for three months. The basis price for coal is \$2.50 at the shipping point, and when coal is at this price, common laborers get \$8.10 a week, and miners, when working by time, \$2 a day. Advances and declines from the basis price affect day wages by a percentage. Miners working by contract get one-third of all advances and lose one-third of declines. For the fiscal year ending June 30, 1899, the average price was 5 per cent below the basis. The year ending June 30, 1900, would run above that. There was a gradual rise from 5 per cent below in July, 1899, to $7\frac{1}{2}$ per cent above in June, 1900. Mr. Luther had no later figures at the time of his testimony. The average wages for the last 2 or 3 years would not be far from the basis rate. (646, 648, 649, 652.)

C. Company stores and houses.—1. *Company stores—justification generally.*—Mr. ROBINSON, an operator of West Virginia, knows of no operators who do not have company stores. They are necessary at first because of remoteness of mines from other stores, and later in order that by the profit from them mines may be made to cover fixed expenses during dull seasons of the year. Many would otherwise be compelled to go out of existence or cut wages. The system is in accordance with the general tendency to concentrate a number of lines of business under one head. (15, 16.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says he does not know of any mining company now running company stores, but some do give orders upon stores, receiving compensation from them for deducting the amount from the wages of the miners. The witness considers it only right and proper that the miners should give their employers the preference in purchasing the necessities of life, provided they can buy there as cheaply as elsewhere. Often the mines are isolated so that the miners would suffer if credits were not advanced them by the companies. The witness does not believe that mines are kept in operation simply by the profits of company stores and company houses, where they would otherwise be closed. (79, 81.)

Mr. MITCHELL says that company stores may be necessary at first when mining towns are started in isolated places. If some operators have them others must also, in order to compete, especially since the profits are often very high. Sometimes companies do not allow competing stores to be established in towns where the land is owned by them, but usually they do. Miners do not need this system because of the credit that is given them. Their credit at other stores is good and if wages were paid weekly in cash there would be no difficulty. (43, 44.)

Mr. ROSS thinks that company stores have never been abused to any such extent in Illinois as in some other States, and that the evil is steadily decreasing. These stores were more or less necessary when the mines were first started in isolated places. But when towns grew they were forced to meet the prices of other stores and were often abandoned. In earlier times they were often a source of immense revenue to the owners, and enabled them to underbid their competitors. The miners of Illinois have to some extent contracted with their employers as to the prices at which mining supplies shall be furnished. (183, 185.)

2. *Company stores—Prices, and compulsion to patronize.*—Mr. DALZELL, an operator, believes that company stores are sometimes to the advantage of the miners, where the employers are of the right disposition, but they are often very injurious to their interests. The company store which was formerly operated by the company with which he is connected was intended to promote the interests of the employees. It was finally closed, as it did not prove profitable, but was leased to another individual, and orders upon the store are still issued by the company. The company, however, receives no percentage for paying the orders which are turned in by the miners to the store. (115, 116.)

Mr. MCKAY says that the prices of company stores are often excessive. He knows of one recent instance where powder which could be bought at other stores for \$1 a keg was sold for \$2.25. The H. C. Frick Coal and Coke Company has 18 or 20 union supply stores, where the prices are from 15 to 20 per cent higher than in the neighboring independent stores. Usually where the operator owns the ground he does not allow other stores to be built. In some cases where other than the owners are allowed to establish stores, the owner receives 10 per cent for establishing the store-order system. It is possible often for miners to supply themselves from stores in the neighboring villages. In one instance mentioned, peddlers and delivery wagons are prohibited from going near company houses. Instances where it is necessary to establish company stores because of isolation are rare. (67, 68.)

Mr. McKay adds that in 1896 the New York and Cleveland Gas and Coal Company, which had no company store, proposed to other operators and miners to pay a uniform scale at 5 per cent reduction from existing union rates. Most of the company stores in the Pittsburg district were accordingly temporarily closed; but the wage agreement having been broken, they were reestablished in most instances. The method of issuing store orders varies. Sometimes a coupon book or a card is issued for a certain amount of credit, from which coupons are torn or punches made. (61, 67.)

Mr. PEARCE, secretary of United Mine Workers, says that although the use of company stores and store orders is not universal it is very common, and the results are injurious to miners. No other stores but the company stores will take store orders, and miners are practically forced to patronize them and pay the prices they charge, which are usually high, especially if the mine is some distance from a town with competing stores. Where the operators own the land around the mine they usually refuse to allow other stores to be established. The witness at one time worked for Robbins Coal Company, about 2 miles from Cambridge, Ohio. He found he could make purchases more cheaply in the town, but at every pay day he was asked why he did not deal with the company store, and finally he was so placed that he could not work, although he was not formally discharged. He considers that trade unions will be the most effective means of overcoming this evil. (97, 98.)

Mr. JAMES says that many miners have recently told him that they were compelled by the mine superintendent to buy provisions as well as mine supplies from the company stores. Mr. James has an account for goods bought at a company store of the Parrish Coal Company, amounting to \$23.29, with the prices for the same goods at private stores amounting to \$6.72 less. The operators maintained their stores in defiance of the Pennsylvania law until that law was declared unconstitutional. (147, 148.)

Mr. ROBINSON, a West Virginia operator, says that prices in mine stores are regulated by the competition of stores in the vicinity, to which miners often send their children or go themselves for supplies. Protests are made by organizations against prices, but they are really not excessive. Miners are free to deal with these stores as they please, nor do they cut a figure in suppressing strikes. Miners draw from the company orders on stores in sums from 50 cents to \$2 and present these at store. Most miners have some cash left to draw on pay day; pay rolls are usually heavy. (15, 16.)

Mr. STEPHENSON says that all mining companies in West Virginia issue store orders. Pasteboard checks, not transferable, are issued to employees, good at the store. Sometimes a little cash will be given at the store on these orders. Witness knows of instances where miners were compelled to deal considerably with the company store or lose their position. Prices are fully 25 per cent higher than elsewhere; flour, \$5 to \$7 per barrel; sugar, 15 pounds for \$1; Arbuckle's coffee, 12½ to 20 cents a package; ham, 12½ to 17 cents a pound; canned corn and tomatoes, 2 cans for 25 cents. Mr. Stephenson recently bought a barrel of the best flour at a private store for \$3.85. (24, 25.)

Mr. MITCHELL, president of the United Mine Workers, testifying in July, 1901, stated that wherever the labor organizations of miners had become strong they had greatly reduced the evils of company stores and tenements. In the unorganized fields, such as West Virginia, the miners must either deal at company stores and live in company tenements, paying exorbitant prices and rents, or they will lose employment. (699.)

3. *Company stores.—Anthracite region.*—Mr. Brooks says there are operators in the anthracite district who maintain company stores. He presumes that in small places these stores charge high prices, but this is impossible in a place like Scranton. In these smaller places the operators who have stores are doubtless at an advantage in competing in producing coal with those who do not have stores. Certain stockholders in the mining company with which the witness is connected operate a store, and where the consent of the miners is given in writing the mining company will deduct from wages for purchases at the store. Doubtless in some cases mining officials are inclined to coerce their men by a company store. (158-160.)

Mr. JAMES, a miner, says that practically all anthracite mine operators have stores for supplying powder and other miners' materials, and many of them have stores for provisions and other goods as well. The witness was formerly employed by the Lehigh Valley Coal Company at Jeanesville. Just before the strike of 1897 the mine foremen went through the mines and informed all those, including the witness, who did not buy their mining supplies from the company store that they could leave unless they did so. The success of the following strike prevented this threat from being carried out. The price for powder at the company store was then \$2.75 per keg,

while it could be bought from other stores for from \$1.25 to \$1.50. Prices for other materials were in similar proportions. This company did not maintain a provision store, although one was run by a former mine operator, and orders were issued upon it by the company.

It is noticeable also that where miners have small balances left on their store checks for miners' supplies the company often claims a charge for blacksmithing sufficient to offset the amount. The witness submitted one account of \$24 earned by a miner with the amount exactly offset by charges. (141, 142, 147, 148.)

Mr. MARCY, an independent anthracite operator, says that his company has no store, but it collects for a store where the miners trade. He does not know who compose the firm that owns the store, or whether any member of his company is interested in it; he is not. He has had similar arrangements with other stores in previous years. The store makes a small payment for clerk hire—about what it costs to make the collection. The company makes the arrangement as an accommodation to the men. They are not solicited to patronize the particular store, but are entirely free to trade where they will. Mr. Marcy does not know that the men are compelled to trade at any company store, but he does not know that compulsion is not exercised. (680, 671.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company has never had a company store. It sells the miner tools and anything he needs; but on the supplies other than powder the company gets barely enough to cover the cost and a small percentage of waste. (652, 653.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that his company has no company stores, and makes no collections for store keepers. Every miner gets his money every 2 weeks and can do with it as he pleases. (655, 656.)

Mr. LOOMIS, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, says that his company has no company stores and does not deduct from wages any bills that the men may contract in any stores. (661, 664.)

4. *Powder—Anthracite region.*—Mr. BROOKS says that mining companies in the anthracite region sell powder directly to the miners, not from a store. The cost at wholesale is now about \$1 per keg. By an agreement made in 1877 the operators promised never to ask more than \$3 for powder. The cost has at times been higher than that, but since the cost has fallen the price to miners has also been lowered. (160.)

Mr. LOOMIS, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, testifying in March, 1900, says that his company sells powder to the miners at \$2.75 a keg. He does not know what it costs the company. The miners are not free to buy powder elsewhere. He does not know how the price is fixed, but he understands that powder is used as a basis on which the wages are figured, under an old agreement. (663.)

Mr. MARCY, an independent coal operator, states that he sells powder to the miners at \$2.50 a keg, and it costs his company probably \$1.50. The difference is not regarded as a profit, but account is taken of it in reckoning the cost of mining. (670.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that for 10 years or more his company has sold powder to its miners at \$1.50 a keg. (653.)

5. *Company stores—Legislation.*—Mr. MITCHELL says that nearly all State laws, however great care was taken in framing them, have been held unconstitutional as abridging the right of contract. In other cases they are evaded by placing the store in the name of other individuals, or, as in Illinois, by offering cash, but immediately, before it can be taken up, taking it back and giving a check, the implication being that the check is bought with the money. (43, 49.)

6. *Company tenements.*—Mr. MITCHELL says that mine tenements are built of the cheapest material, usually not weatherboarded and sometimes not plastered. Often only one well is sunk for 12 or 14 houses, and only one water-closet furnished for 3 or 4. Influence is brought to bear to compel men to live in these houses, and they are a strong means of coercion in time of strike. A 3-room house usually rents for \$4 a month; a 4-room house for \$6; a 5-room house for \$8. Construction by companies may be necessary in isolated places, but the same things are done in large towns. (45.)

Mr. MCKAY says that in some rare cases the operators may find it necessary to build houses in order to secure labor, but usually miners prefer to have no company houses, and plenty of labor could be secured in a short time. (68.)

Mr. ROSS considers company tenements wrong in principle, although they may prove convenient where mines are isolated. (183-185.)

Mr. STEPHENSON, of the United Mine Workers, says that all mine operators own nearly all of the miners' houses. Usually these are made of boards straight up and down, unplastered, but with thick wall paper over boards inside. Miners are virtually compelled to rent these houses, either because there is no land on which they or other persons can build houses, or because otherwise their conditions of employment would be made unfavorable. In case of strike, companies immediately give notice to vacate, so that system becomes a strong means of coercion. Construction of houses by operators may be necessary at the opening of mines in remote places. (26.)

Mr. PEARCE says that the houses built by mining companies are usually very poor, small, and unsanitary. In Ohio, at least, they are mostly of straight up-and-down boards, and many are not plastered, although the companies usually paper them at their own expense. The witness knows of 5 houses which were built in 1882 for \$95 each, and which are renting for \$5 or \$6 per month. It is often true that the houses are worthless after the mines have been worked out, but the mines usually last at least 15 to 25 years. Cases have occurred in several mining States where miners have been evicted upon striking, and where this has been threatened as a means of coercion. (98.)

Mr. SCHLUEBERGER says that it is to the advantage of operators that miners should be furnished with comfortable houses, superior to the hovels in which they formerly lived. His own company, and all the larger companies in the Pittsburgh district, he believes, furnish satisfactory houses at a reasonable price. They contain 8 rooms, costing perhaps \$800, with modern conveniences. In many cases the miners could obtain no other houses. Thus at one of the witness's mines there are at present plenty of applicants for work, but no houses to put them in, and 50 houses are being built. Mining operators expect to obtain a reasonable profit from these houses. (80, 81.)

Mr. DAVIS says that the best miners' tenements are found in the anthracite region of Pennsylvania, but even then they are unsatisfactory and the rents are unduly high. The conditions are worst in West Virginia, where a majority of the houses contain only 2 or 3 rooms, are built of upright boards, and have no conveniences, cupboards, proper water supply, or sanitation. The miners there are worse housed than other wage-earners in small towns. Their rent is usually about \$2 a room. The houses maintained by the Davis Coal and Coke Company, however, are of very fair character. Since the life of mines is likely to be from 25 to 50 years, companies ought to put up comfortable houses. (133, 134.)

Mr. ROBINSON, a West Virginia operator, says that as a rule miners' houses in West Virginia are owned by operators, but miners are not compelled to live in them nor discriminated against if they do not. Thirty-two per cent of witness's employees own their own houses, many having been aided to build them by witness. Men are ordered out when they strike, but this does not seem to check their striking. (12, 16.)

7. *Company tenements.—Anthracite region.*—Mr. BROOKS, an anthracite operator, speaking for his own mines especially, holds that tenements are constructed mostly at the desire of the men themselves. He would prefer not to build any; but since the company can furnish them at cheaper rates than private owners, they are demanded by the miners. He admits that they are not of a very satisfactory character, but holds that they are as good as can be furnished for the rent paid. They are mostly of 2 stories, with 2 rooms on the lower floor. The sanitary conditions are often bad, but this is apparently due largely to the character of the tenants. The rent charged is \$6 per month, a ton of coal monthly being furnished by the company. Houses built by private owners are better, but the rents are considerably higher. (158, 159.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company owns a great many houses, which it leases to its employees, but that it prefers to have them live in the towns and villages, where it need not make provision for them. There are isolated places where it is necessary for the company to furnish houses. When wages went so low, about 1898, and the working time was so short, "the company forgot to charge them any house rent." Probably half the men, perhaps more, live in the towns away from their work and are carried to and from their work by the miners' trains—some of them 10 or 15 miles. These trains are run by the Reading Railroad to accommodate the men and keep them in the towns, "where they own their own houses and live just as other people do under municipal government." The men are charged for passage just about what it costs to run the trains—about 5 cents for 15 miles. Sometimes there is a deficiency which the Coal and Iron Company makes up. (648, 652.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that the houses owned by his company have from 4 to 10 rooms. A 4-room house rents for \$2, \$3, or \$4, according to its quality. There are some houses that cost \$6, and some 10-room houses that run as high as \$8. All the company's houses are good. It is the desire of the iron company, so far as possible, to have the miners live in the towns. It makes better people to live where town facilities, schools, and churches are available. It is on this account that the company has established the running of miners' trains. (657.)

Mr. LOOMIS, superintendent of the coal-mining department of the Delaware, Lackawanna and Western Railway, says that his company has very few tenement houses. (661.)

8. *Company doctors.*—Mr. SCHLUEDERBERG, at one of the largest mines controlled by his company, has made arrangements with the miners that they shall pay a certain sum per month for a doctor. It is optional with them to enter this arrangement, but where they do so the company collects the monthly sum and the doctor furnishes the necessary attendance and medicines. (80.)

D. Hours of labor.—1. *Bituminous mines.*—Mr. MCKAY, of the United Mine Workers, says the reduction of hours in coal mining has been solely due to the efforts of trade unions. The result has been very beneficial in raising the standard of intelligence. The ability of miners and other producers to produce more than can be consumed makes a reduction of hours necessary. There is special need of short hours in coal mines because of the unhealthy conditions. (70.)

Mr. STEPHENSON, of the United Mine Workers, says that the reduction of hours enables the workman to improve his intellectual faculties and become a better citizen. Miners are more justly entitled to reduction than men working above ground, because of the unhealthy conditions in which they work. In Illinois, Indiana, Ohio, and parts of Pennsylvania and the Western States the 8-hour day has been secured by miners and is satisfactory to both sides. (27, 28.)

Mr. MITCHELL says the 8-hour day has been secured by agreement of employers and miners' organizations in Pennsylvania, Ohio, Indiana, Illinois, and in parts of other States. Operators object little except on the ground that the reduction is not universal. Trade is to some extent diverted to districts having longer hours, where the proportion of fixed expense of mine operation is less. More men have been given employment under the 8-hour system, and miners are improving themselves in health and mind. He speaks of the beneficial effects of shorter hours in Great Britain and the desirability of uniform hours on account of the competition of different districts. Working long hours in one district injures others. (47, 48.)

Mr. Mitchell says further that the reduction to 8 hours per day is specially desirable in coal mines because of excessive production; but a man can do as much physical work in 8 hours as in 10. Miners are willing to accept the same rate per ton under reduced hours, so that the operator would lose nothing. His machinery would not even stand idle a greater part of the year than at present. So far where hours of miners have been reduced mine laborers who work by the day have had their wages correspondingly reduced. (36, 41, 47.)

Mr. DAVIS, of the United Mine Workers, says the 8-hour day is demanded by the trade unions everywhere. Its effects in the mines have not yet been fully proved, but the increase in the tonnage last year seems to show that it is not injurious to operators of mines. There are special reasons why the 8-hour day is desirable on account of the unhealthy conditions prevailing in mines. (129, 135, 137.)

Mr. PEARCE, of the United Mine Workers, says the reduction of hours in coal mines to 8 has not injured the operators; at least there was no objection raised to the continuance of the system at the time of the last annual agreement. The miners have had more time to read and study, to enjoy their homes and society, and their health has been improved. (100.)

Mr. MULLINS, an Ohio operator, says that the 8-hour system has given satisfaction to the miners, and generally also to the operators. One effect in the Massillon district has been to compel the introduction of better machinery for handling coal, so that the miners can now produce practically as much as in 9 or 10 hours, when they often had to wait to have their coal hauled out. Moreover, the miners were not always actually working full time under the former system, whereas they are now required to do so. (171.)

Mr. DALZELL, an Illinois operator, believes that most of the coal operators, at least in Illinois, granted the demand for the 8-hour day unwillingly, and believe still that it was injurious to their interests. A man can not do much more than four-fifths of the work in 8 hours which he could in 10. It may be best for his health and welfare to consent to such reduction of his earning capacity, but the result is likely to be what it was found to be in Illinois, that the miners ultimately secure as high

wages for 8 hours as they would for 10, although doing less work, thus injuring employers. The witness concedes that the miners may have produced as much, taking the entire year through, under the 8-hour system as under the 10-hour system, because of the more continuous working. The excessive producing capacity of the coal mines of the country may thus justify an 8-hour day. The witness admits, finally, that the 8-hour day, if uniform in the coal mines throughout the country, would be advantageous to all concerned; however, it is disadvantageous to the producers of any coal district when it does not prevail in other districts. (109, 111.)

Mr. SCHLUEDERBERG, a Pittsburg operator, says the reduction of hours in coal mines to 8 per day has injured the operators, since the machinery, which is now largely being used, lies idle two-thirds of the day. It has been found impracticable to run different shifts. The "tipple" outside the mine can be run satisfactorily only by daylight, and unless run at least 10 hours a day is unprofitable. The witness does not believe that the miners have really shortened their hours materially; being paid by the ton, they have always worked about as long as seemed to them best. (82.)

2. *Anthracite mines.*—Mr. MARCY, an independent anthracite operator, says that the wages of miners are hard to state, because some of them will work 5 hours in the day, some of them 3 hours, and some of them full time. Ten hours are called a full day, but Mr. Marcy does not think he has 3 men out of 120 or 125 who will work so long. They usually work 4, 5, or 6 hours. It is exceptional if one works over 7. It is impossible to compel regular working hours. The law requires that if 10 men come to the foot of the shaft they be allowed to come up. It often happens that Mr. Marcy would be glad to run until 6 o'clock, but is compelled to stop at 4 because the supply is falling so short that he can not afford to keep the plant in operation. If the men would all stay and work it would go right on. (667-669.)

Mr. JAMES, of the United Mine Workers, says anthracite miners mostly work 10 hours per day, although they are sometimes compelled to work even more. Owing to the great oversupply of labor there are many constantly idle, and the shorter workday is needed to take up the unemployed and to increase the regularity of employment. The shorter day would also have beneficial social and educational effects. (149.)

Mr. BROOKS, an anthracite coal operator, considers 8 hours a big day's work in the mines and would favor the reduction of hours everywhere to that number. (154.)

E. General social conditions. (See also *Drunkenness and the liquor traffic*, p. CLIX.)—Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that the general conditions in the homes of the miners, including the foreigners, are satisfactory. There has been very great improvement. The foreigners used to live 8 or 9 or 10 in a room and 15 or 20 in the same house. But these conditions are largely done away with. The foreign miners are living like other people. The young people are Americans. (656, 657.)

Mr. BROOKS, an anthracite operator, says that during the past 15 years the condition of the miners in the anthracite region, especially of the native born and of those from northern Europe, has improved considerably, although their wages have not increased. They are more intelligent and refined, and their habits are better. They spend their money more judiciously. The miners from southern Europe are gradually catching American ideas. (160.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that little food is produced in the vicinity of his company's mines. There are some farming counties parallel to the coal valleys, but the markets are largely supplied from the cities and from the country that supplies Philadelphia. In many parts of the region the miners have little patches of ground and raise vegetables and potatoes. (653.)

Mr. SCHLUEDERBERG, a Pittsburg operator, states that coal miners are on a decidedly higher plane than 25 years ago, when the mines were extremely unsanitary and the miners' houses mere hovels. Wages have been increased and hours reduced. The miners, having become more educated, require more pay and comforts. But very few American-born men will mine coal. (81.)

F. Strikes of coal miners. (For general statements, see *Strikes and boycotts*, p. CLI.)—1. *Strikes of 1894 and 1897.*—Mr. MULLINS, an Ohio operator, says that the great general strike of 1894 was due primarily to the action of the New York and Cleveland Gas Coal Company, which reduced the price for mining 10 cents below the rates agreed upon by the operators and miners of the country. This compelled other operators to seek reductions, and the strike followed. The result was an advance of 10 cents per ton. The strike of 1897 was caused by the same company in practically the same way and the result was an advance of 5 cents per ton. (173.)

Mr. McKAY, of the United Mine Workers, says that the New York and Cleveland Gas and Coal Company employs about 1,000 men in its 3 mines. It refuses to cooperate with other operators in agreements with miners, and by cutting prices and wages is able to demoralize the entire trade. Owing to the excess of producing capacity above consumption one operator can set prices for a very much larger amount of coal than he can produce. This company refuses to deal with unions or to employ union men; its wages are usually 5 cents, but at present 12 cents, per ton lower than those of other operators. It first claimed the right to pay lower wages because it paid in cash and had no company store. In 1896 it proposed to miners and other operators to establish a uniform price at union rates, provided all operators made cash payments and used uniform screens. Most mines agreed to this, but later the agreement was broken, company stores were reestablished, and wages fell from 70 to 54 cents per ton. The miners who were employed by operators who maintained the agreement themselves volunteered to reduce wages in order to equalize competition. (60, 61, 73.)

Mr. MITCHELL says that the purpose of the general coal strike of 1897 was to increase price of coal and thereby wages by suspending production. The strike lasted 84 days and yet the amount earned by the miners was greater than in the preceding year, wages having been raised. (36.)

Mr. SCHLUEDERBERG says that the strike of 1897 arose because the operators were practically forced by the demoralization of prices to break an agreement as to wages made with the miners' organization. The attempt was made to bring down prices for mining from 65 cents to 54 cents per ton. The miners' officials did all in their power to prevent the strike, but it was necessary in order to secure reasonable conditions. (78, 79.)

Mr. DAVIS says that the strike of 1897 was ordered because it was impossible for the miners to earn enough to supply the necessities of life. The masses of the people were in sympathy with the movement. (129.)

Mr. PEARCE says that although this strike was ordered by the United Mine Workers, and although the great bulk of the laborers had nothing to do with starting it, they joined in the strike and secured the benefits of its result. No notice to or arrangement with employers was made concerning this strike. Its result was a gain of fully 20 per cent in wages. (90.)

Mr. DAVIS says that one of the noticeable effects of the great strike of 1897 was a marked transfer of coal from its customary markets to others where the strike had caused a shortage. Thus 3 weeks after the strike was inaugurated there was quite a shortage in Chicago, St. Louis, and Cleveland, but this became less 5 weeks later. Coal which had been going to Buffalo and thence to the Northwest by water was shipped to Cleveland, that which had been going to the Northwest from Iowa and Kansas was sent to St. Louis; while West Virginia and Kentucky furnished coal to Chicago. These facts show the difficulty of success in strikes where the aggregate productive capacity is in excess of the demand. (127.)

2. *Lattimer strike.*—Mr. JAMES says that the Lattimer strike of 1897 was brought about immediately by the brutality of a superintendent in striking a miner, although there were other grievances which it was likewise sought to remedy. The operators refused to discharge the offending superintendent and the miners struck. The result was that the company signified its willingness to remedy some of the evils, although the superintendent was not discharged. One of the evils had been compulsion to buy supplies for mining at high prices from the company stores; this was practically done away with. The miners engaged in this strike were not organized and had no effective leaders, which apparently accounts in part for their lawlessness. The witness believes, however, that the shooting of strikers by the sheriff and his deputies could have been prevented by wise action on his part. The miners were patrolling and parading on the highway, and none of them had arms, as was shown by the fact that none of the sheriff's posse was injured. Only a few days before the mayor of Hazleton had kindly told the strikers that they must not march through the principal streets of the town, and they had gone by another route. A similar procedure might have been employed by the sheriff. The witness believes that the action of the sheriff was due to the desire of operators to cow the men and force them to return to work. (139-143.)

3. *Strikes at Pana and Virden, 1898-99.*—Mr. MITCHELL, president of the United Mine Workers, says that the strike at Pana, Ill., was caused by the refusal of one operator to pay the wages agreed on by the general convention of operators and miners, of which he had been a member. The State board of arbitration and the executive committees of the miners' and operators' associations, declared this scale fair and unanimously supported the strikers. The operator imported colored laborers, and the riot was brought about by part of these attempting to prevent others, under the influence of the miners' organization, from leaving the town. (52, 53.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, states that the Illinois Coal Operators' Association in 1897 fixed differential prices for mining in the different districts of Illinois, and these were later agreed to by the miners. The operators of the Virden and Pana fields, however, refused to accept the rates fixed and left the association. When the miners struck against the rates fixed by these operators, the dispute was submitted, by agreement on both sides, to the Illinois State board of arbitration. When the decision was made, the operators refused to abide by it, claiming that it did not cover the ground which they had agreed to arbitrate. (118.)

Mr. ROSS, secretary of the Illinois bureau of labor statistics, says that the defense fund of the miners' organization of Illinois has chiefly been spent in connection with the strikes at Virden and Pana. The cause of these difficulties was the failure of the mine owners to comply with the agreements between the interstate organization of miners and the organization of operators as to the price of mining. After having agreed to arbitrate, the mine owners repudiated the decision of the State board. They endeavored to import labor from the South, many of the men having been in the convict mines in the Southern States. These men were brought in under the protection of Winchester rifles in the hands of men who were not citizens of Illinois. The governor of Illinois did not mean to declare that he had the right to deprive a man of the privilege of contracting for his labor, nor did the color question enter into his action. He held simply that the men imported were an undesirable class of citizens, and that it was illegal to bring them in under the protection of an alien armed body. The laborers imported were never actually taken from the trains, but were carried to St. Louis and thence distributed to other States. The mining operators finally agreed to pay the mining rate fixed for that district. (178-180.)

4. *Strikes in the anthracite region.*—Mr. LOOMIS, superintendent of the coal mining department of the Delaware, Lackawanna and Western Railway, testifying in March, 1900, says that this company has had no recent general strikes; no labor difficulty beyond local strikes of breaker boys. (659.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, testifying in March, 1900, says that his company has been entirely free from labor troubles. There has been none since 1888. At that time there was a strike, not caused by any difficulty between the company and its men, but growing, as a sympathetic strike, out of a strike of the railroad employees. (654.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, testifying in March, 1900, says that his company has had only one general strike since 1875, namely, that of 1888. (653.)

Mr. MITCHELL, President of the United Mine Workers, said in July, 1901, that it is very difficult to describe accurately the conditions of the workers in the anthracite field prior to the strike in the fall of 1900; in fact, conditions varied very much in different collieries and between the different districts. In the Schuylkill and Lehigh districts, where one-half of all the anthracite miners are employed, their wages were based upon the price at which coal was sold at tidewater. When coal sold for \$5 a ton at tidewater, the miners who worked by the day were paid at the rate of \$11.20 for a week's work. Of course, the mines did not work constantly; if the mines worked only half a week the miners received only half a week's pay, and so on. When the sliding scale method was first adopted, 25 or 30 years ago, it was regarded with favor by labor organizations, an agreement having been made which permitted the miners to serve on the committee with the operators to determine the price at which coal was being sold; but when the miners organization lost its strength, the companies alone determined what coal was sold for, and consequently the sliding scale became an evil, as the miners had no way of knowing whether they had been treated honestly by the operators or not. The strike of the fall of 1900 was only settled by the operators agreeing to fix a stationary rate of wages, and abolishing the sliding scale.

The condition of the miners in the anthracite district, prior to the strike, was deplorable. Nearly one-half of the mining population was unable to speak the English language. Bitter racial prejudices existed between the various nationalities, keeping them apart and rendering them easy victims of the greed of their employers, who were permitted to overcharge the miners for everything they bought at the company stores, where they were usually compelled to deal. Many of the companies did not own stores, but all companies owned the long rows of company houses, which are unfit to live in.

Employment in the anthracite district is very irregular. An average of 180 days per year is all that the anthracite miners have ever worked.

For many years efforts have been made by the United Mine Workers' organization to organize the anthracite miners; but so bitter was the antagonism among the men

that it was unable to succeed. It became obvious that conditions of employment could not be improved, unless through a strike, the miners should be aroused from their lethargy. The officers of the miners' organization made every honorable effort to arrange a conference with the mine operators, with the hope that an adjustment of the miners' grievances could be made without resorting to a strike; but they failed utterly. The operators evidently believed that the anthracite mine workers could not be induced to strike. There were only 8,000 of them attached to the United Mine Workers.

When the operators refused to meet the miners, the miners drafted a scale of prices, which called for a general advance of about 10 per cent; a reduction in the price of powder from \$2.75 to \$1.50 per keg, semimonthly payment of wages, and the abolition of truck stores.

The strike involved 140,000 men and boys, and threw out of employment not less than 50,000 other people. It continued for 39 days and resulted in a victory for the miners, all their demands being conceded, excepting the official recognition of the organization. However, the companies have recognized the local mine committees, and they take up for adjustment any grievances the miners may have with officers of the union. This latter arrangement was brought about at a conference held in New York City in March, 1901, and it was practically agreed that if matters moved along properly the organization would be recognized and contracts made with it next year. (699-701.)

G. Blacklisting.—Mr. STEPHENSON says that employers frequently place men on lists, especially for taking active part in organizations. Clerks of companies have been seen, when men applied for positions, to run over a list of names and often to reject the applicant after doing so. Mr. Stephenson himself has been on a list, and others have told him of similar experience. No objection would be made to such lists of incompetent men. (22.)

Mr. MITCHELL says that the blacklist is one of the worst weapons miners have to contend against. It is chiefly directed against men active in organizing labor. It is difficult to prove the existence of it. Special abuses of this sort exist in West Virginia. (37.)

Mr. DAVIS has been told that miners are frequently compelled to leave a community because of being blacklisted for taking an active part in trade unions. (128.)

Mr. MCKAY says that men who are discharged sometimes find it impossible to get work, or are discharged again after a day or two; but it is practically impossible to prove that blacklists have been used. (65.)

Mr. ROSS believes that the practice of boycotting is not a very successful one from the standpoint of labor, and that it is unjust. Blacklists are more effective, since it is easier to reach the producer than the consumer, and they also should be abolished. (182.)

Mr. MARCY, an independent anthracite operator, says that he has heard of blacklisting among the operators of his district, but he has no knowledge of it. He does not believe that a miner in the valley has ever been blacklisted, at least in his time. He knows none have been blacklisted to him or by him. (671.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that his company does not maintain any blacklist. It never asks where a man comes from when he applies for work. If he shows that he is a competent miner, and if there is work for him, he is taken on. (655.)

H. Joint conferences and agreements in bituminous coal fields.—

1. *Desirability.*—Mr. DALZELL, an Illinois coal operator, says that where either party to the wage contract is at liberty to terminate it at any time he sees no reason why employers should not practically fix wages without any formally signed contract; but where an attempt is made to establish systematic wages for a definite period, as for a year, a formal contract is desirable. Such contracts tend to prevent cuts of wages through excessive competition of operators. (120.)

Mr. DAVIS, vice-president of the United Mine Workers, declares that the wage contracts frequently required by employers in the coal trade are not considered by the miners' organizations fair or free. The conditions imposed are determined solely by the employer, and the workman is often practically forced by his necessity to agree to all of them. (125.)

Mr. MITCHELL, president of the United Mine Workers, also says that contracts between operators and miners individually, not made by organizations, are practically not free. They are drafted by the employers, and the miners must sign or go without employment. The courts hold them, however, to be binding. Such contracts often force the miner to waive many rights, especially allowing an employer to retain whatever earnings are in his hands whenever the miner leaves for purpose of obtaining better conditions. (33.)

Mr. SCHLUEBERG, a Pittsburg coal operator, says it has never been found necessary in the coal trade in recent years to resort to arbitration by outside parties. The miners and the operators meet in yearly State and interstate conventions, establish agreements, and are able to settle their differences by joint discussion. They have come to know one another better and both sides are more liberal and fair than before. (74, 76.)

Mr. MCKAY, of the United Mine Workers, says the wages of coal miners are now chiefly fixed by joint agreements of the United Mine Workers and committees of employers, made yearly. These have lessened the number of strikes and increased harmony. The witness believes that by a more thorough organization of both miners and operators, with mutual discussion of the conditions of business and of rates of wages, better conditions might be obtained and more harmony between miners and employers established. (59, 63.)

Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, thinks that agreements between employers and employees fixing the conditions of labor for a period of time are a very powerful agency in promoting industrial peace. One of the chief hindrances to the establishment of these agreements has been the unwillingness of employers to recognize labor organizations. Another difficulty has arisen from the fact that employers have been unable to agree among themselves and unwilling to form organizations. The differences in local conditions make it difficult for employers to come together with a view to establishing uniformity and making the basis of competition more fair. (686, 688.)

2. *History and methods of interstate conferences.*—Mr. MULLINS, an Ohio operator, says that during the eighties the bituminous miners and operators of the country established a system of joint agreements as to wages, hours, etc. This system was interrupted by the strikes of 1894 and 1897. A joint conference in January, 1898, resulted in an advance of wages and the adoption of the eight hour day. The system is considered beneficial to the operators, since it enables them to calculate upon expenses accurately. The enforcement of these contracts rests upon the honor of the operators and the miners, but both are usually inclined to abide by them. (173.)

Mr. MITCHELL, president of the United Mine Workers, states that the system of interstate joint conferences between the bituminous coal operators and representatives of the miners' organization had its origin in 1885, when an informal conference of representatives of the operators and miners of Ohio, Indiana, the northern district of Illinois, and the western portion of Pennsylvania took place. In the spring of 1886 another conference, representing the same districts, was held and an agreement entered into. These conferences continued each year until 1889, when, as a result of the failure of the operators of southern, central, and eastern Illinois to take part or pay the scale of wages, the northern operators were forced to withdraw from the interstate conference, thus causing the dissolution of the interstate joint conference movement. However, the operators and miners of Indiana and Ohio continued to meet in separate State conferences after that date.

At the close of the disastrous and expensive bituminous coal strike of 1897 an understanding was arrived at between the leading operators of Illinois, Indiana, Ohio, and the western part of Pennsylvania whereby a conference was to be held in Chicago in the spring of 1898. This conference was attended by nearly all the operators from the districts above named, and an agreement fixing wages and regulating the conditions of employment was entered into, and these conferences have been held in the spring of each year up to the present time and are likely to continue for an indefinite period.

Mr. Mitchell describes the organization and methods of business of the joint annual interstate conferences. He says that many operators from each of the four States or districts covered by the system attend the conferences, as do representatives from each local union of the United Mine Workers of America. A committee on rules and order of business is selected, and after their report is made and adopted a permanent organization is formed. The operators and miners of each of the 4 States represented have an equal number of votes—that is to say, 4 votes are given to the miners of each State, and 4 votes to the operators of each State, and it is mutually agreed that any principal motion that affects the formation of the scale or the conditions which shall govern employment must receive the affirmative vote of all of the miners and all of the operators. If a settlement can not be effected in the general joint conference a scale committee, composed of 4 miners and 4 operators from each district, is selected. A stenographic report of the proceedings of both the general conference and the general scale committee is made, printed, and furnished to the officers of the miners' organization and to the operators. Should the general scale committee fail to reach an agreement it not infrequently happens that a subcommittee of 4 miners and 4 operators is selected from the general scale committee, and they go into execu-

tive session. No stenographic report is made, and usually an agreement is arrived at which is presented to the general scale committee, and to the general joint conference. (697-699.)

Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, states that the interstate conferences in the bituminous mining industry were inaugurated at Chicago in January, 1898, as the result of the long and bitter strike in 1897. Conferences have been held annually since, and agreements regarding wages and conditions of labor have been adopted.

The interstate convention is held immediately after the convention of the United Mine Workers. There is a large representation of miners and operators from each of the four States of Pennsylvania (Pittsburg district), Ohio, Indiana, and Illinois. The questions at issue are not settled in open convention, but a general discussion takes place there, after which the formation of a scale is referred to the joint scale committee, consisting of 4 miners and 4 operators from each State. The final adoption of the details is usually referred to a subcommittee of 16. There has never been a failure to reach an agreement. The system has resulted in greater uniformity in conditions and in a much better feeling between employers and employees. (678, 682.)

3. *Purposes of interstate conferences.*—Mr. JUSTI says the main purpose of the establishment of the system was to bring about uniformity in the conditions of mining in these States, so as to put all operators upon an equal basis in competition. Prior to the adoption of this system chaos had prevailed. Labor was always dissatisfied, and operators did not work at all in harmony. Often they were not acquainted with one another. The miners of one employer would strike because they were getting less pay than those at some neighboring mine, while some operators, on finding that they were paying higher rates than their competitors, would shut down the mines until the rate could be reduced.

The system of interstate agreements regarding the conditions of labor has done much to bring about uniformity and a fair basis of competition. Operators are able to know in a general way what it costs other operators to mine coal. Entire uniformity has not yet been realized. In Pennsylvania, Ohio, and Indiana the use of screens before the weighing of the coal is permitted, while in Illinois coal is paid for on the run-of-mine basis. The differential between machine mining and pick mining has not been uniformly established. Mr. JUSTI believes that the degree of uniformity which has been secured, and which could be brought about only by a recognition of the labor organization among the miners and a joint agreement with it, has been of great advantage to the operators and has brought stability to the mining industry. (677, 678, 682.)

Mr. MITCHELL also states that it is a fundamental principle of the interstate movement "that the scale of prices is based not upon the earning capacity of the miners alone, but principally upon the opportunity of each district to produce coal at a price which shall enable it to be sold in fair competition with every other district; that is to say, no attempt is made to make wages uniform or the earning capacity of the men equal between the different districts, or within the districts themselves, the principal object being to so regulate the scale of mining as to make the cost of production practically the same in one district that it is in another."

Mr. STEPHENSON says the aim of the United Mine Workers is to equalize the prices of mining in competing districts and States for the benefit of operators as well as of miners. It does not desire to reduce the profits of the operators, but rather to increase the price of the product. (29.)

4. *Effect on the relations of employers and employees.*—Mr. MITCHELL in July, 1901, made the following statement with regard to the effect of the joint conference system: "The establishment of this joint conference system has done much to remove the barrier which formerly existed between employer and employee. As a result of their meeting together in free and open discussion, each side having equal power, they have become more fully acquainted with each other's needs and wants and with each other's business affairs; and they have grown to know and respect one another, in some instances becoming social friends. And strikes and lockouts have been reduced to a very great degree; in fact, there are very few serious strikes, either local or otherwise, in any of the districts covered by our joint agreements." (699.)

5. *Effect on wages and conditions of labor.*—Mr. MITCHELL states that since the adoption of the system of joint agreements in 1897 "wages have increased an average of 40 per cent in the 4 districts which are parts of the interstate movement, and practically the same advances have been secured for the miners of the States of Alabama, Kentucky, Tennessee, Missouri, Kansas, Iowa, Michigan, and the central part of Pennsylvania, where State joint conferences have been established between the operators and miners. The 8-hour workday has been secured in nearly all the States to which reference has just been made. The semimonthly payment of wages in cash

has been established, and the size of the screens in use has been so regulated as to minimize their evil effects." (700.)

Mr. JUSTI says that the first interstate agreement in the bituminous mining industry, made in January, 1898, advanced wages materially above those prevailing before the strike of 1897. Again in 1900 the rate of pick mining was advanced considerably, by from 7 to 11 cents per ton, while the rate of day wages was increased 20 or 25 per cent. There has been no further advance under the agreement of 1901. The increase in wages by the advance of 1900 will probably be equal to nearly \$20,000,000 for the miners of the 4 States affected by the system.

Mr. Justi states that there is no attempt on the part of the interstate conference to fix the prices of coal. The advance in wages naturally has some influence on the price of coal, but the witness does not think that the entire increase in recent years has become a tax upon the consumers of coal. The prices for all commodities have advanced and the cost of living is higher than before. The condition of the mining industry has been rendered more stable by the agreement system, and the steadiness of work and the fair wages paid to the miners help them to contribute to the general prosperity of the country. The Illinois Coal Operators' Association also refrains entirely from interference with regard to prices. The chief effect of the agreement system has probably been to equalize the prices in different districts rather than to advance them. (683, 685.)

Mr. Justi says that the number of workmen coming under the scope of the interstate agreement system is now about 175,000, being somewhat greater than it was in 1897. (684.)

6. *Enforcement of joint agreements.*—Mr. JUSTI states that the Illinois Coal Operators' Association has been formed chiefly for the purpose of enforcing joint agreements in the mining industry, and settling disputes relating to the interpretation of the agreements. The miners of Illinois, as well as of other States, scarcely yet understand the sacredness of the contracts into which their organizations enter with the operators. There is difficulty also because the miners, many of whom are unable to read English, do not always understand the terms of the agreements. New men are constantly coming into the mines and must be educated to understand the system. Often newly elected officers of local unions try to make demands which are contrary to the terms of the agreements. A clause of the State agreement in Illinois provides that no local demands shall be made except at meetings of the operators and miners in the districts and subdistricts held prior to May 1 of each year. There is a growing recognition of the binding nature of these agreements, and the witness believes that the chief officers of the miners' unions are doing all they can to enforce them. Organization of employers, however, is also necessary. (677, 678, 681.)

Mr. Justi explains how the Illinois Coal Operators' Association undertakes to interpret and enforce the joint agreements. He says that when a demand is made by the miners of any mine, which is not covered by the joint agreement, the association sends out circular letters to ascertain from operators what the custom on that matter has been. The commissioner then meets the officers of the United Mine Workers and the question is discussed, so that uniformity in practice is secured. The records of the association, after a few years, will show the decision of almost every question which is likely to arise. In other cases where a charge is made of a violation of the agreement, careful inquiries are immediately undertaken to ascertain whether there have been violations on either or both sides, and just what the nature of the violations have been. (683.)

7. *Settlement of disputes under the agreement system.*—Mr. MITCHELL, president of the United Mine Workers, says that there is no provision in the interstate agreements which confers authority upon any central body to adjust local grievances which may arise during the life of the agreements; but in Indiana and Illinois the operators have organizations, and the operators of each of these States have a representative known as a "commissioner," whose duties and functions are very similar to those of the presidents of the district organizations of the United Mine Workers of America. In most instances local disputes are adjusted by the commissioner of the Coal Operators' Association and the presidents of the district organizations of the United Mine Workers of America, when they can not be settled by the local mine manager and the committee of the local unions of the miners' organization. Should the commissioner and the president of the district organization of the United Mine Workers of America fail to agree, it frequently occurs that the dispute is referred to the national officers of the miners' organization and adjusted there. In portions of Ohio the operators also employ a commissioner; but in Pennsylvania and in other portions of Ohio disputes are adjusted by the employing operator and the local mine committee or the officers of the district miners' organization. (59.)

Mr. JUSTI says that the Illinois coal miners and operators feel that disputes should

be settled as near the source as possible, and as promptly as possible. Clauses of the joint agreement for the State provide accordingly that in each mine the pit committee shall be recognized, and in case of a dispute between the pit boss and any miner, this committee, together with the president of the miners' local union, may adjust the matter with the pit boss. In case of failure to agree, the matter shall be referred to the superintendent of the company and the president of the miners' local executive board. The next higher appeal is to the superintendent of the company and the president of the miners' organization for the subdistrict, while disputes which they can not settle are referred to the State officials of the United Mine Workers of America, in connection with the higher officials of the company. The commissioner of the Illinois Coal Operators' Association ordinarily meets the officers of the United Mine Workers in case of disputes which are not settled by the lower authorities. Either the president or the vice-president of the State organization of United Mine Workers meets with the commissioner, usually at the place of dispute. The operators and miners directly interested are present at the conference, and when necessary witnesses are brought in, but usually only those connected with mines having similar conditions. All formality is waived, and the fullest latitude is given to witnesses, with no attempt to embarrass them. The sole purpose is to bring out the truth.

The officer of the the United Mine Workers and the commissioner of the Coal Operators' Association reach an agreement, which is binding on both sides. There never has been an appeal. In some cases, however, there has been a failure to agree and reference of the dispute has been made to Mr. Mitchell, president of the United Mine Workers, in connection with Mr. Justi.

During the past year about 200 cases have been brought before the commissioner. About equal numbers of these originated with the operators and with the miners. Possibly 80 per cent of the cases were decided against the miners, who are the more likely to be in the wrong, because of the misunderstanding of the terms of the agreements on the part of local organizations and officers.

Mr. Justi describes more fully the 3 cases which have been referred to Mr. Mitchell and himself for decision. One of these cases was trifling, and Mr. Justi consented to Mr. Mitchell's opinion in the matter. Another case referred to the question whether men doing construction work at mines should be forced to become members of the United Mine Workers. Mr. Mitchell preferred not to make a decision, and the matter was referred to the joint State convention of 1901, which agreed that such men should be excluded from the union.

The third dispute referred to was in the Danville district, and had to do with the interpretation of clause 16 of the State agreement. This clause provides that, under the scale of wages, except in "extraordinary conditions," the work of the miners shall include the loading of coal and the proper timbering of the working places and other details regarding the care of the mines. The dispute arose as to what constituted "extraordinary conditions." The operators took the position that the purpose of this clause in the State agreement was to give to the operators of the Danville district, which is the basing district, the right to demand clean coal from the miners without incurring extra expense. The State miners' organization and the operators of the district failed to agree, and there was danger that 4,000 miners would quit work. At a joint convention held at Danville in April, 1901, a resolution was passed to refer the matter to Mr. Mitchell and Mr. Justi, whose decision should be binding. These gentlemen made a very thorough inspection of 4 of the 10 mines involved, devoting 3 days to the work, and then, after a session of 2 days, rendered a decision. This decision, which was submitted in full by Mr. Justi, defines in considerable detail the classes of work which miners shall be required to perform in connection with the getting out of coal. It also urges both operators and miners to consider questions of this sort in a fair and liberal spirit. Mr. Justi says that the decision was substantially in favor of the operators, but that it was accepted and carried out by the miners. (679-681, 693.)

8. *Illinois Coal Operators' Association—State agreements.*—Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, states that that organization was formed exclusively for the adjustment of labor matters. It is intended to aid the operators in enforcing the joint agreements with the miners' organization and in settling disputes which may arise. It was felt that mutual respect would be furthered by the establishment of a strong organization on each side, and that the adjustment of the conditions of labor would then become strictly a matter of business. The employers' organization also serves to relieve the individual operators of the necessity of dealing with the miners in many cases, giving the advantage of specialization.

The Coal Operators' Association has recently established a commissioner, Mr. Justi, whose main object is to meet representatives of the miners' organization in the

settlement of disputes. The expense of the organization is maintained by an assessment upon the operators in proportion to their tonnage. (677, 678, 685.)

Mr. Justi adds that, subject to the interstate agreement regarding the conditions of coal mining in Pennsylvania, Ohio, Indiana, and Illinois, the miners and operators of Illinois adopt annually a State agreement. A joint convention is held immediately after the convention of the United Mine Workers for the State, and the agreement is adopted in practically the same manner as the interstate agreement. The proceedings of the convention are published in full, in order that, should any question later arise regarding the interpretation of the joint agreement, the arguments for the adoption of the clauses might be conveniently referred to. There are 9 scale districts, formed in view of the differences in the conditions of mining, and the agreement provides for the differentials between these districts in the scale of wages. After the joint State convention, district and subdistrict conventions are held to determine strictly local conditions. All of the local agreements, as well as the State agreement, are then printed together and distributed throughout the State. The general distribution of these agreements has been found to be very advantageous, since formerly the contents of them were not always understood by the miners. Mr. Justi affirms that these conferences in Illinois, like the interstate conferences, have been of great advantage to operators and miners alike, and that, in his belief, 95 per cent of all differences between employers and employees can be settled amicably if the parties would only come together in conference. (680-683.)

Mr. Justi submits a copy of the State agreement between the Illinois Coal Operators' Association and the United Mine Workers for the year ending March 31, 1902. This agreement contains a scale of wages for pick mining, the rates being fixed for each of the 9 separate districts, with variations also as regards particular mines and subdistricts. The basis of wages is the amount of run-of-mine coal. The rates vary from 42 cents to 81 cents per ton, in accordance with the differences in conditions.

The wages to be paid for outside day labor are left unchanged from those of 1900, but it is provided that no topman shall receive less than \$1.80 per day. The inside scale for day labor is based on the interstate scale adopted in 1898 with an advance of 20 per cent, but in no case shall less than \$2.10 per day be paid to miners.

Miners are to be paid twice monthly, and advances between pay days are made at the option of the operators. The price of powder per keg is fixed at \$1.75, and the miners agree to buy their powder from the operators.

The scale of prices is based on coal free from slate, bone, and other impurities, weighed before screening. The miners must drill and blast coal in accordance with the State law of Illinois regarding safety. The operators are guaranteed the hearty support of the United Mine Workers in disciplining any miner who fails to properly mine and load coal. The scale of wages includes, except in extraordinary conditions, the work required to load coal and properly timber the rough places and to brush and care for the working places generally.

The hours of labor are fixed at 8 hours per day by this agreement. All men working by the day are required to perform the full amount of labor, the time of going to and from working places, hitching up mules and doing other preparatory work, as well as the time required for meals, not being included in the counting of the 8 hours. If for any reason operators work their mines less than 8 hours, they are to pay proportionately per hour; but if a man goes into a mine in the morning he shall be paid for not less than 2 hours' work.

The agreement virtually provides for the exclusive employment of members of the United Mine Workers in mine work proper. The United Mine Workers are denied jurisdiction over the mine manager, foremen, hoisting engineers, and certain other superior workers. They are also refused jurisdiction over men employed in preliminary construction work or extensive repair work. The authority to hire and discharge men is vested in the mine manager and his subordinates, but if a man claims to have been discharged unjustly or through error he has a right to appeal to a joint board.

The agreement provides for the recognition of the pit committee representing the miners, but their duties are confined to the adjustment of disputes, and they are not permitted to go about the mine unless called upon by the pit boss or by some employee who has a grievance. The operator and his mine manager or superintendent shall be respected in the managing of the mine and in directing the working force. Provision is made for the discussion of disputed matters between the officers of the Mine Workers Union and the employers, with final reference of matters that can not be otherwise settled to the State officials of the United Mine Workers and the Illinois Coal Operators' Association. The system of arbitration provided in this agreement has been more fully described elsewhere (see p. CXXXVIII). (688, 692.)

9. *Extension of the agreement system.*—Mr. JUSTI says that in Kentucky and Iowa the operators and miners hold State conferences and adopt agreements very similar to those in Illinois and the other States covered by the interstate agreement system.

The attempt has been made to secure the admission of Iowa and Michigan to the interstate conference, but the operators have objected, especially those of Pennsylvania and Ohio. Mr. Justi thinks that their opposition was partly due to the fear that the influence of those States would be overbalanced by the more western States if Iowa and Michigan were admitted. The Pennsylvania and Ohio operators have contended that no other State should be admitted until West Virginia was brought in. The operators of all the States would be glad to have West Virginia brought into the conference, but the miners there are not organized. The United Mine Workers are trying to bring them into organization, but apparently with little success.

The product of West Virginia comes into direct competition with the coal of Pennsylvania and Ohio, both at the seaboard and in other markets. It also competes directly with Indiana and Illinois coal, being sold largely in Chicago. The operators of these western States would therefore be very glad to see West Virginia brought into the agreement system. The cost of labor is lower in West Virginia because of the absence of organization. It is true that there are differences in the mining conditions, but these could be provided for by differentials in the scale of wages. (684, 685.)

Mr. MITCHELL states that systems of State agreements between operators and miners, based upon the interstate system, have been introduced in Alabama, Kentucky, Tennessee, Missouri, Kansas, Iowa, Michigan, and the central district of Pennsylvania, all districts not covered by the interstate agreements. The principal disturbing feature in the coal industry is the lack of organization among the miners of West Virginia and the absence of any agreement between them and the operators. If the system of interstate agreements could be extended to West Virginia, there would probably never be cause for the cessation of work in the coal mines of the United States. The witness entertains strong hopes that the time will soon come when both miners and operators in West Virginia will recognize the advantages of the agreement system. (699.)

Mr. ROBINSON, a West Virginia operator, says that the operators in West Virginia hold joint meetings with the State association of miners, and that they have recently agreed on a scale and a system of arbitration. They prefer to deal with this local organization rather than with a national organization, because the weight of influence in the latter rests with representatives of other coal fields with interests largely opposed to those of West Virginia operators and miners. (14.)

Mr. STEPHENSON, of the United Mine Workers, says that the national miners' organization and the great body of real miners do not recognize the State organization in West Virginia. It is only a side show of the operators, who pay the salaries of the leaders in order that they may influence the miners. The joint contract made with this organization as to rates of mining is merely dictated by the operators, who entirely refuse to meet with representatives of the national organization. (20.)

I. Labor organizations of coal miners—1. History.—Mr. DAVIS says the first organization of miners dates from about 1868. It was especially strong among anthracite miners. In 1869, and again in 1883, attempts were made to establish national organizations, which succeeded in covering quite a large territory. In 1886 the Knights of Labor organized a district assembly of miners. In 1889 the organization of 1883 was reestablished under the name of the National Progressive Union, and soon after the United Mine Workers was organized as a combination of the Knights of Labor and the Progressive Union. The present organization is stronger than both of its predecessors put together. (124.)

Mr. PEARCE, secretary of the United Mine Workers, says the first organization of miners was in connection with the Knights of Labor. In 1881 a trade union was organized in Ohio, which spread considerably. The United Mine Workers, a national organization, was formed in 1890, and had a membership varying from 7,000 to 23,000 up to 1897. At the latter date there were very few miners organized, especially in the States of Pennsylvania, Indiana, and Illinois. In Illinois there were only 226 members of the union among 30,000 or more workers. Owing to the success of the strike of 1897 the membership greatly increased, and now (April, 1899) includes about 60,000 paying members, besides 15,000 or 20,000 more who do not pay the tax for the national organization, which is not expected from all members of local unions. (90.)

Mr. STEPHENSON, of the executive board of the United Mine Workers, says that many miners formerly belonged to the Knights of Labor, but they later broke away and joined the American Federation of Labor, because they desired to manage their

own affairs instead of being controlled by members of other trades. The American Federation gives moral and sometimes financial support in time of strikes. The membership of the United Mine Workers (April, 1899) is over 100,000. The national executive board, of 11 members, has power to declare strikes, levy assessments, and otherwise direct organization during the intervals between national conventions. The expenses are met by an assessment of 10 cents per month. In case of strikes special assessments are levied, no fund being accumulated in advance. (18, 19.)

Mr. MITCHELL, president of the United Mine Workers, said in April, 1899, that the organization had about 78,000 members out of 397,000 mine workers in the country; 75 per cent of its membership was in Pennsylvania, Ohio, Indiana, and Illinois, where the 70,000 miners were nearly all organized. The constitution defines the purposes of the organization as, securing of proper wages, paid in lawful money weekly on the basis of coal properly measured; introduction of proper appliances for ventilation, drainage, and prevention of accidents; establishment of the 8-hour day; exclusion of children until satisfactorily educated and at least up to 14 years; prohibition of employment of detectives or guards; establishment of arbitration and conciliation. (30-32.)

Mr. MCKAY states that the executive board of the national organization is composed of 8 members besides the president, the vice-president, and the secretary-treasurer. Benefit features are confined to the local organizations. The members of the board usually look after the interests of the miners in their home districts, but at times several or all visit one district. The organization had only about 16,000 members in 1897, but now (April, 1899) has from 75,000 to 80,000. It has had a marked effect in benefiting coal miners, reducing hours and increasing wages. It has entirely supplanted the Knights of Labor, its policy of open meetings being preferred by miners and operators to secrecy. (58, 59.)

Mr. ROSS says (May, 1899) that the trade unions throughout the country have been growing rapidly during the last year or two, although the prosperity of the country has been increasing. The development of the miners' organizations has been especially noteworthy. The European laborers who were imported in large numbers for the purpose of opposing organizations have, especially in Illinois, nearly all joined the unions recently. (180.)

Mr. MITCHELL stated in July, 1901, that "at the annual convention in January, 1897, the total membership was 11,000; in January, 1898, 25,000; in January, 1899, 54,000; in January, 1900, 91,000; in January, 1901, 189,000. The present membership is approximately 250,000."

Mr. LUCAS, editor of *The Black Diamond*, says that in West Virginia there is a separate miners' union, somewhat similar to the national union. It has been organized three or four years. Not all of West Virginia is organized, however, and this fact is still a great source of irritation to the miners in Ohio and Pennsylvania. (For further testimony regarding the West Virginia organization, see *Extension of the agreement system*, p. CXL.) (676.)

2. *Anthracite region.*—Mr. JAMES says (April, 1899) that the organization of the miners has progressed very slowly in the anthracite regions. The United Mine Workers began organizing there about 1895. The Lehigh region was not reached until 1897, and the Lackawanna Valley only in 1899. The proportion of all anthracite miners organized is still small. (138.)

Mr. BROOKS, an independent anthracite operator, says (May, 1899) that there has been little organization among anthracite miners until very recently. The operators do not know whether they employ organized or unorganized men. The unions have not been unreasonable in their demands in recent years, though they usually form a center for pushing complaints. (165, 166.)

Mr. MARCY, an independent anthracite operator, says (March, 1900) that a considerable number of his men are organized. He does not know what portion. He asks no questions. A man is equally welcome whether he is union or nonunion. Just before his testimony Mr. Marcy had dealt with a committee of the United Mine Workers which had approached him with a complaint that he was paying less than others, but had satisfied itself after an independent investigation that he was not. (669, 671.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says (March, 1900) that he does not know of any labor organizations among the employees of his company. He has had no dealings with labor unions, and the miners have not at any time asked the company to deal with them collectively. (646, 648.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says (March, 1900) that he has not been asked to treat with any organization of miners

since 1888. At that time, on the occasion of a strike in sympathy with the striking railroad men, the company did treat with the miners. (654.)

Mr. LOOMIS, superintendent of the coal mining department of the Delaware, Lackawanna and Western Railway, says (March, 1900) that he has no knowledge of any labor organizations among his employees. He deals with the men individually and pays no attention to their being union men or otherwise. (659.)

3. *Relation to employers.*—Mr. SCHLUEDERBERG, a Pittsburg operator, says that 30 years ago trade unions in the coal mines were very overbearing; but in later years, especially since the organization of the United Mine Workers, their relation to employers has been very satisfactory. The only drawback is that the organization is not strong enough to enforce its conditions of wages, etc., uniformly in all districts and mines. It is a great benefit to the producers to have even a certain degree of uniformity secured by the existence of a national organization covering different States. It would be possible that the trade unions should become extreme in their demands if they were sufficiently strong and included practically all the miners; but a tpresent the competition of other mining districts prevents excessive demands. There have been fewer strikes and difficulties in late years, since the practice of making joint agreements between the operators and the miners' organization has been adopted. The witness, however, believes that the employer has the right to hire whomsoever he will and discharge whom he pleases, just as the workingman has a right to accept or refuse work. There are mines in the Pittsburg district where union labor is not recognized or employed, but in most cases there is no discrimination against it. Union and nonunion men work side by side. (74-77.)

Mr. MULLIN's experience as a mine operator in Ohio has been that trade unions are beneficial both to the employees and to the operators. Where, as with the miners' unions, they are managed by conservative and able men, they give a stability to wages and business which is advantageous. All the miners, practically, in the witness's mines, belong to the union. Membership in the union is not made a test upon their entering the mines, but when nonunion men enter they are soon persuaded to join it. The witness knows of no case where the unions have demanded that men must join the unions before being employed. (166, 172.)

Mr. ROBINSON, a West Virginia operator, says that employers prefer to deal with a union because they can count on more constant work. Before organization strikes often took place without notice, and without thorough discussion by the men, among themselves or with the operators. (14.)

Mr. MITCHELL, president of the United Mine Workers, says that if laws were passed prohibiting mine owners from preventing their employees from becoming members of labor organizations, these organizations themselves could do much to check abuses in methods of payment, in safety and sanitation of mines, etc. (49, 56.)

4. *Relation to nonunion men.*—Mr. DAVIS, vice-president of the United Mine Workers, says that the policy of this organization, as of other unions, is to use all possible influence of a legitimate nature to bring in nonunion men. It does not, however, directly advise its members to refuse to work with them. But where a large proportion of the men in any one mine are organized, they can usually bring in the remainder. This is sometimes done by requiring that all men in the mine shall contribute to a check-weighman fund, or to some other good purpose, contributions constituting the individual a member of the organization. (125.)

Mr. JAMES, of the executive board of the United Mine Workers, says the nonorganized miners mostly approve of the efforts of the unions. Some of them, however, are shown special favors by employers, and are expected accordingly to influence their comrades not to join unions. This statement is based simply on the difficulty of enlisting men who are receiving large wages, who are specially favorably situated. The union makes no attempt to interfere with free contract by operators or nonunion men, but uses peaceful means to influence the latter to join the organization. (138, 139.)

Mr. McKAY, of the executive board of the United Mine Workers, says the policy of the organization is to reason with nonmembers and show them the advantages of organization. In rare cases members refuse to work with nonunionists. In time of strike nonmembers are urged to join in striking, and very frequently do so. Thus while only 16,000 men belonged to the organization in 1897, 150,000 or 200,000 went on strike. It is recognized that it is impossible to secure higher wages in one mine or district unless the others are raised also. (59, 65.)

Mr. PEARCE, secretary of the United Mine Workers, says that nonunion men usually obey strike orders issued by the miners' organization, but no coercion is employed to force them to join in striking. The general attitude toward them is conciliatory; arguments are presented to induce them to join the union. It is an occasional, though not a common practice, to refuse to work with them. They are always wel-

come to join the organization, and even when members have broken their pledges they are received back freely. (90, 91.)

Mr. STEPHENSON also says that nonunion miners usually comply with the orders of the union declaring strikes, and where a strike is successful they receive the same advantages. They have gained greatly by organization. (20.)

Mr. MITCHELL, president of the United Mine Workers, says its organization seeks to benefit nonmembers as well as members, although, if they refuse to cooperate, it sometimes does not make equal efforts in their behalf. Agreements with operators as to wages fix rates for all miners, including nonunion men. Nonunion men frequently obey strike orders. Where the organization is strong members sometimes refuse to work with nonmembers, but never try to prevent them from working by intimidation. The organization believes that a miner who refuses to become a member injures himself and the trade also, since the wages of organized miners are affected by the lower wages of the unorganized. (32-34.)

Mr. ROSS testifies that the miners' organizations of Illinois do not ordinarily refuse to work with nonunion men, although many local strikes have been caused by men refusing to join the organizations. Every effort is used to induce men to become members. (181.)

Mr. DALZELL admits the desirability, even the necessity, of trade unions, but believes that they exceed their rights when they attempt to coerce men to join the organization, or to compel employers to employ only union men. He has been told by other operators in Illinois that union men have stood at the mouth of a mine and demanded to see the union cards of employees before they would allow them to go down the shaft. (118, 119.)

5. *Relation to colored labor.*—Mr. MITCHELL says the United Mine Workers admit colored miners freely, and where they are organized they receive the same wages as whites, work in same mines (though usually not as partners of white men), and even hold office in unions. In nonunion mines in Alabama colored men work for less wages. They are quite largely organized in Alabama, however; and the competition of colored men does not specially tend to decrease wages, because they do not work very hard. (32, 52, 53.)

Mr. PEARCE says that colored men are members of the United Mine Workers in many cases, and are often very efficient. But they have also been brought in from other States, usually being deceived as to the conditions of employment, for the purpose of combating strikes, as at Pana and Virden, Ill. (101.)

6. *Influence on wages.*—Mr. MITCHELL says that coal miners' organizations have had a marked effect in keeping up wages, and are an absolute necessity for the self-defense of the weaker side in labor contests. The United Mine Workers aim to secure uniform prices per ton of coal mined, and this has practically been done in States where the organization is strongest. This does not discriminate against the better workmen, since they can earn more in any case. Mr. Mitchell admits the tendency to disregard superior skill and strength, but holds that there is little difference in skill in mining. (34, 45, 46.)

Mr. LUCAS, editor of *The Black Diamond*, says that the work of the United Mine Workers in the 4 competitive fields—Pennsylvania, Ohio, Indiana, and Illinois—has been very effective. Some of their demands have been unreasonable, but the operators have had to succumb. The miners have been very greatly benefited. Their increased wages added about 22½ cents, on an average, to the cost of a ton of coal in 1900, as compared with 1899. Wages were never so high in any so-called prosperous times, as for instance those of the early nineties. Besides, the miners have the 8-hour day, which they had not then. The consumer has to pay the higher wages. Illinois coal, which now costs \$2.25 to \$2.50 delivered, could have been bought 2 years ago for \$1.50 to \$1.75. Some kinds of coal have been sold at Chicago, in times of depression, as low as 90 cents on the track. Miners got fair wages then. They got about 40 cents a ton, and could make \$2 or \$2.50 a day. They had not steady employment then, however, and now they have. (673, 674.)

J. Sanitation and safety laws.—1. *Need and benefits—Generally.*—Mr. DAVIS says that the conditions in mines, owing to the lack of pure air and sunlight, are especially unhealthful. In the anthracite regions, and in a less degree in the bituminous mines, miner's asthma is common and frequently proves fatal. The witness has known many men who entered the mines at the time he did to die from this cause, although many others are healthy enough. The use of the safety lamp tends to injure the eyes. The sanitary and personal safety laws enacted in the mining States have made a vast difference in the conditions of the mines. Partly through legislation and partly through other influences, much greater precautions are now taken to protect miners than in earlier days. Ventilation especially has been improved. The old ventilating furnace has been replaced by fans and other improved

methods. State inspection has done much to secure sufficient air and freedom from gases and impurities. The State inspection is usually effective and beneficial. In general, however, miners' organizations can accomplish more for the good of the workmen than legislation. (136, 137.)

Mr. MITCHELL, president of the United Mine Workers, says that in American mines one man is killed for every 277,200 tons of coal, and at least a dozen suffer injuries. Three men are killed daily. The mining laws of Great Britain have reduced fatal accidents greatly. Laws increasing the liability of employers would do much to check accidents. Some States have fairly satisfactory laws to protect safety and health of miners; Ohio, perhaps, the best. But the laws do not require sufficient ventilation. They nowhere require that less than 100 men shall breathe the same air forced into the mine. Uniform laws are desirable. (56.)

Mr. SCHLUEDERBERG, a Pittsburg operator, believes that reasonable remedial legislation regarding coal mines would be a benefit to operators as well as to the miners. Uniformity as between different States is especially desirable, as it would tend to put producers on the same competitive basis. (88, 89.)

Mr. BROOKS, an anthracite operator, believes that by careful discussion by representatives of both labor and capital laws could be formed which would be satisfactory to both. Uniform laws in all the States would be possible and desirable, though they would require very careful study. These laws could be passed by the States themselves. The objections of operators to laws heretofore passed have usually been removed by a fair trial. (164, 165.)

Mr. PEARCE, of the United Mine Workers, says that the safety and inspection laws have made great improvements in the conditions of mining, especially in Illinois, Indiana, Ohio, and Pennsylvania. Ohio has perhaps the best laws. The inspection in all these States is systematic and thorough. The laws differ little in their general nature, but uniform legislation under a national law might be advantageous. Many advantages can be secured better by direct action of the miners through their organizations than by legislation. The United Mine Workers have no formal committee on legislation and do not take a very active part in framing it, although they often send a delegate to push some particular measure in the State legislature. Mining laws have been often brought forward by some miner who has been elected to the legislature. Much useful legislation has been held unconstitutional by the courts. (103, 104.)

2. *Ohio*.—Mr. MULLINS, an Ohio operator, states that the laws for Ohio for protecting miners are beneficial to them and to the employers. Miners are fairly well protected, and the inspectors perform their duties faithfully. The laws of Pennsylvania, however, are more rigid as to the qualifications of inspectors, superintendents, and bosses. (174.)

3. *Illinois*.—According to Mr. ROSS, the mining laws of Illinois, as revised in 1899, are probably the best to be found in any State. The new statute was prepared by the labor bureau in consultation with the miner's organization and the mine operators, and was substantially agreeable to all those interests. It was passed without opposition or amendment. Uniformity of mining legislation is desirable, but difficult to secure because of the differences of conditions in the different States.

The factory laws of Illinois are fairly well advanced, but the legislature has often failed to make sufficient appropriations to enforce them satisfactorily. (190, 191.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that a new general mining law is being sought in Illinois. Both the miners and the operators have appeared before the State bureau of labor and practically agreed upon a bill, although the witness understands that the miners have amendments to the bill after it was drafted by the joint meeting. At present the inspection laws are satisfactory. There are 9 State mining inspectors, while counties producing a certain number of tons of coal may establish county inspectors. These inspectors are subject to the State bureau of labor, which is composed of 5 men representing both capital and labor. Laws for protecting life can not be too stringent. (107, 114.)

4. *Pennsylvania*.—Mr. BROOKS, an anthracite operator, says that the laws of Pennsylvania, especially those requiring ventilation, have entailed great expense on the operators, but in the long run have proved beneficial to them as well as to the miners. Improved ventilation enables the miners to work continuously, as they could not before. The laws are made effective by the provision that companies shall be responsible for injuries caused by failure to comply with the law. (162, 163.)

The inspectors are required to visit each mine monthly. Most of them are conscientious and perform their duty faithfully, but there is too much politics in their appointment. Some owe their appointments to the influence of mine companies. Though there is an examination as to competency, Mr. Brooks believes that the best men are not always appointed. (161.)

Mr. JAMES, of the United Mine Workers, thinks that the mining laws of Pennsylvania are satisfactory, but are not effectively enforced. Thus the requirement that sufficient air shall be pumped in to sweep away gases and smoke is not carried out. Mr. James himself has recently worked in mines where a full day's work was impossible because of impure air. There are not enough mine inspectors. Often an inspector is not seen at all except in cases of accident. The witness believes that a single miner, by making complaint, should be able to summon an inspector, instead of 15 being required, as at present. (150.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that there are 7 mining inspectors in the anthracite region, and that twice a year is as often as an inspector can visit a mine, unless there is a special call for him. Sometimes the men write an anonymous letter to the inspector, asking him to come, and he is likely to respond. (656.)

Mr. Veith says that by the law of Pennsylvania every person who proposes to work as a miner in an anthracite mine must pass an examination to determine his competency. The court appoints a board of miners, and this board conducts the examination and gives a certificate. A miner applying for work in an anthracite mine must show this certificate unless he is an old employee. This law is understood to have been passed to keep out Hungarians and Poles, but it had the opposite effect. Mr. Veith has not seen an Irishman or a German or a Welshman or an Englishman come in in ten years; but the Italians and the Hungarians have come in droves. (655.)

5. *West Virginia*.—Mr. STEPHENSON, of the United Mine Workers, says there are 5 mine inspectors in West Virginia, but the laws are not satisfactorily enforced. The chief inspector claims that he has not sufficient authority. Fans or furnaces for ventilating mines are required and are usually maintained, but not sufficiently. (28.)

K. Skilled and unskilled labor.—Mr. MCKAY, of the United Mine Workers, declares that there is little strictly unskilled labor employed in coal mines. A man may begin to mine coal immediately, but unless he has had long experience he will not be able to adapt himself to different veins and conditions. Most miners have been raised in the business. (63.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, says that many miners are employed who were not brought up in the business, but he does not believe that this reduces the standard of wages, since they are fixed at so much per ton. He has found that men accustomed to room-and-pillar mining are not so well adapted to long-wall mining as those who have been brought up to the latter method. (123.)

VI. SUNDRY LABOR PROBLEMS.

A. Child labor. (See also p. LXXXII.)—1. *Effects*.—Mr. COATES states that the effect of employing children is to interfere with their development, both intellectually and physically. It tends to throw out adult labor and to increase the army of the unemployed. Instead of the father supporting the family, the children are sent out to support the father. Machinery has increased the employment of children, because a child can often tend a machine and do practically the same work as an adult. (252, 253.)

Mr. STEPHENSON, of the United Mine Workers, says employment of children in mines, and, indeed, generally, is a curse to them and should be prohibited, at least up to the age of 14. The West Virginia age limit is 12, and probably 10 per cent of children above that age are employed. (27.)

Mr. MITCHELL, president of the United Mine Workers, says that the effect of employment, owing especially to unhealthful conditions, is very injurious to health and development. Often boys perform the labor of men, depressing wages. In the leading mining States employment under 14 is prohibited, but the age should be raised to 16 and the hours of labor at first limited to 4. (46, 47.)

Mr. DAVIS entered the coal mines at the age of 8½, and there were many others at that time as young. The effect of such early employment was to check physical and mental development. The witness would advocate keeping the boys out of the mines until 18 years of age. The miners are often so poorly paid that they feel driven by necessity to take their children into the mines to help them, while in some instances operators prefer to employ boys for certain classes of work on account of the lower pay. (135.)

2. *Laws regulating*.—Mr. MULLINS says that the age limit in Ohio for employment in mines has been raised from 12 to 15 with marked benefit, especially from an educational standpoint. Some of the working people themselves opposed this change,

but it meets quite general approval. Children are employed chiefly for tending doors. (171, 172.)

Mr. ROSS says that in Illinois the act prohibiting the employment of children below 14 years of age is generally enforced as regards mines, but that in factories there is great difficulty in carrying it out. The provision in the factory act of 1893 regulating the hours for the employment of women was held unconstitutional, as interfering with the right to make contracts. The State constitution permits special legislation regarding mines. (186.)

Mr. MCKAY, of the United Mine Workers, states that little child labor is employed in Pennsylvania coal mines because of the school law requiring attendance until 15 years of age. Formerly there was much child labor employed, with injurious effects. The proper age limit is 15 years. (69.)

Mr. BROOKS, an anthracite operator, says the Pennsylvania law allows children over 14 to be employed under ground and over 12 above ground. The operators are compelled to take the word of the children as to their ages. Mr. Brooks considers these age limits too low. (161, 164.)

Mr. JAMES, of the United Mine Workers, says there are thousands of young boys employed on the breakers and as door boys. The witness has seen many who, he is positive, are under the statutory age of 14. Machinery, however, is to a considerable degree displacing boy labor on the breakers. (149, 150.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that his company employs boys in the mines, but not under 14 years old inside or 12 outside, as permitted by State law. (656.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, favors prohibiting the employment of children in either factories or mines under 16 years of age. They need the time before that for mental and physical development. (115.)

B. Convict labor.—Mr. SULLIVAN, a metal miner of Colorado, states that there is no convict labor in the Colorado mines. Convicts of the State do some agricultural work, but possibly consume all the products of it. He thinks they make some brick for the market. He considers that convicts ought not to manufacture, raise, or make anything so long as there is a free man or woman who wants to do that kind of work for pay. He would not have them work on the roads. He would not have them employed, even at work which might be expected to be so unremunerative that private capital would not go into it. Any work that it is desirable to do should be done by free labor. He would not permit the convicts to learn a trade. They should not be allowed to do any manual labor at all. They should be provided with literature, and set to studying and reading; given a chance to enlighten themselves.

The working man pays most of the cost of maintaining convicts if they are maintained in idleness. He pays the tax on the house he rents. But he can better afford to maintain the convicts in idleness than to suffer from their competition in the labor market. (356, 360, 361.)

Mr. ROSS, of the Illinois Bureau of Labor, says that all persons are convinced that convicts should be employed for their own good. Since their competition with free labor can not entirely be prevented, the question is to find the least injurious form of employment. When a man is employed on machine labor only, he is less apt to find a position after discharge in just the line of work for which he is fitted, than he would be if trained in hand work and thus generally skilled. The latter kind of work is also more reformatory in its effects. The witness believes the system in vogue in New York, which is being advocated in Illinois also, is desirable. It is frequently urged in the Illinois State legislature that penal institutions ought to be self-supporting. The witness thinks that the prohibiting of the interstate transportation of convict-made goods would be beneficial. (188, 189.)

Mr. COATES says that the question of convict labor has hardly arisen in Colorado, though the labor of convicts undoubtedly affects laborers in other States. He believes that the convict ought to be given enough work to maintain his health, and that he should be made to maintain himself so far as he can by building public roads or by any other work which does not come into competition with free labor. If such competition is permitted it has a tendency to throw men out of employment and to send some of them to the penitentiary to get a job. Free labor would rather maintain the convict in idleness in order to get him out of competition in the labor market. There would be little objection to the convict's labor if it were limited to his own maintenance; but it is usually used mostly for private profit. (258.)

In Colorado, according to Mr. SMITH, the law prohibits the employment of convicts in competition with free labor. No convicts are employed in the mines, but for the most part they work on State roads and other public works. This law is generally approved by the trade unions. (222.)

Mr. ALLEN states that no convict labor is used in the mines of Utah. (572.)

Mr. HAMMOND, secretary of state, of Utah, says that the contracting of convict labor in that State is forbidden. (619.)

Mr. CLARK, of the Western Federation of Miners, thinks that convict labor may best be employed upon the roads. (336.)

C. Immigration and the foreign born (see also p. LXXX)—**Importation of labor.**—1. *Nationality of coal miners.*—Mr. SCHLUEDERBERG says that 25 or 30 years ago the miners in the Pittsburgh district were mostly Germans and Irish; but few of these are left now. Instead there is a mixture of various nationalities—French, Belgians, Negroes, Slavs, and Italians. Very few Americans will mine coal. (81.)

Mr. MULLINS says that the greater proportion of the miners in the Ohio district are native born, being largely the sons of the original Irish, Welch, English, and German miners. The newer wave of foreign immigration has not reached the State largely. (167.)

Mr. JUSTI, commissioner of the Illinois Coal Operators Association, says that in the northern part of Illinois there are many Hungarians, Lithuanians, and Poles in the mines; in the south there are many negroes and native whites, besides Irish, English, and Scotch; in the central part of the State there are many English, Scotch, Italians, and native whites. The large majority, the witness believes, speak English. (681.)

Mr. MARCY, an independent anthracite operator, says that his men are principally Hungarians, Slavs, and Poles, with some Americans and Irish. He does not prefer the foreigners to American miners. Many of each nationality are good workmen, but many are very poor workmen. That was so with the Americans also. (671.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company takes a census of its employees in October of each year. In October, 1899, there were 6,671 Americans, 1,532 English, 5,024 Irish, 2,983 Germans, 173 Scotch, 856 Welsh, 6,485 Poles, 1,679 Huns, and 180 Italians, making a total of 25,583. (652.)

Mr. JAMES says that the largest number of foreign born in the anthracite mines are Poles, Slavs, Lithuanians, Hungarians, and Italians. Mr. James believes that fully 60 per cent of the miners belong to non-English speaking races, and many of them are still unable to speak English. These foreign born were introduced in large numbers by the operators in 1875, to supplant strikers. They belong to the poorest classes, are largely without education, and live in a manner which would starve Americans. Few have built houses, and a large proportion of them are unmarried. These unmarried men largely board with families of their own race, though often they buy their own provisions and pay the landlady to cook them. Cheap meat and potatoes, black coffee and bread, usually with no butter, are their chief food. Some who have come to this country when very young have grown into the customs of Americans, but for the most part the process of Americanizing can not be accomplished in one generation. Not so many of these foreigners are now coming in as formerly, and importation under contract has practically disappeared. Those who come do so mostly through the inducement of friends and relatives. (140, 141.)

Mr. BROOKS states that practically no foreign labor is now being imported under contract into the anthracite regions, and he considers that the former importation was detrimental. The Irish, Welsh, and Germans are still (May, 1899,) the predominating nationalities in the anthracite regions as a whole; but the Hungarians, Poles, and Italians have been coming in rapidly in recent years, and outnumber others in certain districts, especially in places where there are few houses or no conveniences for living. These nationalities do not make as good miners as the others. Most of them have to begin as laborers loading coal. But gradually they are improving in skill and social condition. (158, 160, 161.)

Mr. LUTHER, general superintendent of the Philadelphia and Reading Coal and Iron Company, says that his company never imported any foreign labor. By the laws of Pennsylvania, a foreign miner, no matter where he comes from, can not work as a miner in the anthracite mines without first working 2 years as a common laborer to learn the business. The consequence is that no skilled miners come to the anthracite region from abroad. "No skilled miner from England or Wales, or any other country, is going to come there and work as a common laborer for two years." The law was passed to keep the Huns out, but instead of that it brought them in. (652, 653.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that no Irishmen, or Germans, or Welshmen, or Englishmen have come into the mines during the last ten years. Mr. Veith thinks they have been kept out by the State law requiring experience in anthracite mining. Hungarians and Italians have come in great numbers. They begin as laborers and learn mining as anybody else does. Some of them are very good miners, but the majority are not as satisfactory

as Americans. Ignorance of the language is one great trouble. It is hard to make them understand, and accidents probably result sometimes from this cause. (655.)

2. *Immigration—Social and economic effects—Restriction.*—Mr. PEARCE says that the importation of labor from abroad is less extensive than formerly, both because the operators found each laborer unsatisfactory and lawless in time of strikes, and because of the effective operation of the act prohibiting contract labor. The immigration of British, French, and Germans does not demoralize the labor market, since they demand good wages and a high standard of living. But Slavs, Poles, Hungarians, and Italians have a lower standard and are a menace to the wages and morals of this country. A test as to fitness for entering mines conducted by State officials, might be advantageous in shutting out such labor. (95, 100, 101.)

Mr. ROSS, of the Illinois Labor Bureau, believes that, while the injurious effect of immigration is not as great now as formerly, the country is still suffering from the influx, especially of southern Europeans. Immigrants have been a serious factor in many labor disturbances. In dealing with immigration the first concern of the Government should be to protect industrial interests, rather than merely to consider the character of the immigrants. Absolute prohibition of immigration is advocated in many sections.

The earlier miners in Illinois and other States were chiefly from Great Britain, but they have been largely superseded by Poles, Russians, Hungarians, and Italians. The competition of these newcomers has made mining unattractive to English-speaking people, while many of the latter have, by their superior ability, been able to enter higher lines of industry. Not a few sons of coal miners have become professional men. The miners from southern Europe, on the other hand, have little ambition to rise. (187, 188.)

Mr. MITCHELL says that in former years coal operators often imported immigrants by shiploads; but this has been largely checked by law and by the discovery that these workmen were not ultimately economical. Many of them at first worked 15 hours a day, hoping to accumulate money and return to Europe; but experience taught them that long hours did not pay. Non-English-speaking miners are more lawless. (38, 46.)

Mr. Mitchell thinks that immigration should be prohibited entirely for the present. It tends to depress wages and to drive American citizens from employment. Steamship companies misrepresent conditions in America, and should be restricted in their advertisements. Convict labor was formerly imported and used in time of strike. Miners of foreign birth themselves, at least those from English-speaking countries, favor restriction of further immigration. The taking up of the farming lands in the West has made further settlement of immigrants there impossible. From a trade-union standpoint, immigrants from Great Britain, Germany, and France are more desirable than those from southern Europe, who do not understand trade-union principles. (50, 51.)

Mr. MCKAY says that the employment of immigrants has been very injurious in coal mining. They have been willing to live under the lowest possible conditions and have thus secured employment where skilled and high-class labor could not. They care little for organization, but in time of strikes are inclined toward lawlessness. The witness has known as many as 23 men to live in a house of 4 rooms. They form themselves frequently into a kind of boarding club. (71, 72.)

Mr. SCHLUEDERBERG says that the immigration of the foreign-born has had no particular effect in depressing the labor market in the coal mines, except at times when there was a general depression in any case. The non-English-speaking immigrants soon learn the language, while their children become thoroughly Americanized, without the slovenly habits of their parents. The foreign-born are somewhat more difficult to manage, appearing not to understand the significance of our political conditions and liberties. The witness would not favor restricting immigration of respectable people from any country, but believes that contract labor, as formerly largely brought in, was detrimental, and also that paupers, idiots, deformed persons, and similar defectives should be excluded strictly. (83, 84.)

Mr. JAMES says that immigration has caused a surplus of labor in the coal mines. Almost all the English-speaking miners, although the majority of these are themselves of foreign birth, favor the restriction of immigration. (149.)

Mr. CLARK, of the Western Federation of Miners, thinks that immigration seriously affected the wages of workingmen in earlier years, but has less effect to-day. Foreigners come here with a lower standard of living than that of American workmen, and will depress wages by their competition unless they can be educated to American ideas. This education will best be effected through their countrymen who have already been some time in the country and whose standard of living has been raised. (335, 336.)

Mr. SULLIVAN, a metal miner of Colorado, does not think that we could object to any intelligent immigration, no matter how great. It is the coming of the poorer classes of the European nations, unskilled laborers, which is objectionable. It is not possible to maintain wages and the American standard of living and allow immigrants to come as they do under present industrial conditions. Immigration has reduced wages in the East during recent years; the witness does not think it has materially affected the Mountain States. Doubtless it does affect them indirectly. (355.)

Mr. Sullivan would, however, under present conditions, favor legislation to keep out illiterate, pauper, and criminal immigrants. He thinks that organized labor generally is in favor of such legislation under the present conditions. The organized labor of the West would far rather, however, support the Government ownership of utilities. (361.)

Mr. Sullivan is of opinion that the law is not effective in excluding Chinese, and that they come in from the north and the south. He does not pretend to definite knowledge of the subject. (355.)

Mr. COATES, president of the Colorado Federation of Labor, considers that persons who wish to immigrate have the right to do so, and does not personally favor laws to restrict voluntary immigration. He believes that every human being has the right to wander where he pleases upon the face of the earth. The facilities for education in the United States would elevate foreigners as it has elevated many of our own citizens. The sentiment against immigration has largely resulted from the importation of large numbers of workmen by corporations. If there had not been such importations under contract he does not think the sentiment against immigration would exist. It is true that organized labor is opposed to foreign immigration, and has so expressed itself officially. (257, 258.)

Mr. DALZELL advocates an educational and property qualification for immigrants, even if this should practically stop immigration. It is the practice in his mines to require new employees to be able to understand English. (120.)

Mr. MCKAY advocates the requirement of ability to read and write English as a condition of entrance to this country. There is so much unemployed labor here now that further immigration is unnecessary. (71.)

3. *Importation of labor.*—Mr. MITCHELL says that employers have a legal right to bring in laborers from outside the State, but no moral right. Miners, ordinarily American citizens, settle at mines, build homes, and are established there. Importation of labor drives them away. Usually the laborers imported are deceived as to the conditions of employment. Laws should be enacted prohibiting advertisement for men under false pretenses. (40.)

Mr. Mitchell adds that colored laborers are secured in large numbers, often by misrepresentation, and are brought by train loads, often under armed guards, during strikes and labor difficulties. At Pana, Ill., the employer refused to pay the wages fixed by joint agreement of all operators and miners in the State, and imported colored men. The riot was brought about by these colored men attempting to prevent part of their own number, under influence of the miners' organization, from leaving Pana again. (51, 52.)

Mr. STEPHENSON says that West Virginia operators, during the recent strike on Loup Creek, imported laborers from Virginia; and at another time, in anticipation of a strike, they brought in carloads of colored men from Virginia, who afterwards, finding that they had been deceived as to the prospects, returned home. (23.)

Mr. MCKAY thinks that the importation of labor, whether from abroad or from other States, is naturally resented by miners where it is used as a means of replacing strikers. The contract-labor law should be strictly enforced. The coming of new laborers, where their work is really wanted, is not opposed. (66.)

Mr. SCHLUEDERBERG says that Italian labor was imported by a number of operators jointly at one time during the seventies, but little foreign labor has been imported in the Pittsburg district of late years. Some colored and other labor has been brought in from outside States, and has usually become efficient enough after a few weeks. In 1884 the mine in which the witness was interested brought 50 negroes from Virginia to combat a strike. (78.)

Mr. DAVIS does not believe that there is now much importation of foreign labor. He considers it reasonable and just to protect home labor against such importation. But he considers the importation of labor from one State to another, under contract, as having practically the same effect and as being properly subject to restriction. Such contract labor does not move freely according to the natural demands of the market. (130, 131.)

D. Labor organizations. (See, as to labor organizations in western mines, p. LII; in eastern coal mines, p. CXL.)—1. *Need and effects.*—Mr. HILL regards the organization of laborers as a necessity. There is undoubtedly a tendency on the part of

employers, when anything occurs to reduce profits, to take it out of the laborers. The laborers could not effectively resist except through organization. (373.)

Mr. COATES, president of the Federation of Labor of Colorado, considers that the large mass of the producers of wealth get barely enough to keep them in a decent, respectable condition, and many do not get that. They can not have any surplus at the end of the year. Many are in debt, and can not afford to take a day's rest. The higher the wage a man gets the more opportunities he has to improve himself and the more he does improve himself. Labor organizations regard their wage scales as a minimum. No one is prevented from getting more, and in many instances more is paid. Organized labor is much better off than unorganized. Almost all of the organizations under Mr. Coates's jurisdiction have libraries and reading rooms which they support, and generally the social condition and intelligence of the men are improving. The organized laborers are sending their men into public offices, and they make the best citizens in the community. Mr. Coates finds no such instances in unorganized labor. (251, 252.)

Mr. ROSS, of the Illinois labor bureau of statistics, says there can be no question about the effect of organization in advancing the wages of labor and in making employment more stable. He thinks that labor organizations have also exercised the chief influence in securing protective legislation regarding labor. (185, 191.)

In Mr. JUSTI's opinion, strong organizations of employers and employees are necessary to successful arbitration and conciliation. By organization the services of men of experience and of enthusiasm are secured in carrying on negotiations on each side. There is necessity of training in these matters. Only where two powerful organizations face one another will each side be forced to respect the other and to adopt conciliatory methods. The great industries of the country should be organized on a national scale, but local questions should be left to the settlement of local organizations. Organizations of this sort should deal with labor questions only, and should not attempt to control prices. (686, 687.)

Mr. MCKAY denies that labor organizations have the elements of the trust. Their officers, who have power to fix prices of mining for the entire body, are simply delegates duly elected. (62.)

Mr. LUCAS, editor of *The Black Diamond*, thinks that the trade unions of Chicago have quite too much to do with local politics, and that some of their leaders use the unions for their personal aggrandizement, to the detriment of the rank and file and of the organizations. This trouble has not appeared in the United Mine Workers. Mr. Lucas thinks it would be well for trade unions to adopt a rule that their official representatives should not be allowed to accept any political position while they are representatives of the union. He does not think that equally vicious results come from permitting men who are representatives of corporations to go to Congress or the State legislatures. (675, 676.)

2. *Effect on nonunion labor.*—Mr. SMITH, deputy State labor commissioner of Colorado, thinks that nonunion labor injures union labor, but at the same time the unions restrict the liberty of contract of nonmembers and seek to make their condition so undesirable as to force them into the unions. The action of unionists is more concerted than that of those outside. Many nonunionists sympathize with the organizations. The wages of nonmembers are usually raised by the existence of organizations, and it is rather contemptible of them to refuse to join. The witness does not think that the unions in Colorado terrorize those outside. (212, 213, 223.)

3. *Incorporation of trade unions.*—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, would consider the incorporation of trade unions desirable, in that the sense of connection with the State would exercise a moral restraint upon the more radical element which is found in most of them. He understands that the leaders of the unions object to incorporation because the unions would be more easily reached by the processes of the courts. He does not think there is anything in this reason, as it is not difficult to learn the names of the officers and chief actors in any movement which requires the action of the courts. (273, 274, 286.)

Mr. SMITH, deputy labor commissioner of Colorado, approves of incorporation for the sake of making the property of the unions more secure and of other advantages. He admits that it would increase responsibility on the part of the unions. (212.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, advocates a requirement that trade unions shall incorporate, with capital stock, as a means of holding them to performing contracts made with employers and carrying out awards of arbitrators in case of dispute. (See *Arbitration*, p. —.) (116, 117.)

Mr. ROSS believes that the general attitude of union leaders concerning incorporation is one of indifference or opposition. Personally he thinks that incorporation would be advantageous in legal matters before the courts, and would encourage arbitration by increasing the responsibility of the workingmen. More effective discipline

over the members of the unions could also be maintained, although there are now practically no complaints of the failure of members of organizations to respect their contracts. (180, 181.)

Mr. STEPHENSON, of the United Mine Workers, thinks incorporation undesirable, because the organization could be held responsible for the breaking of contracts by its individual members, and sometimes the courts would be unjust in their decisions. Those members who own property would have it levied upon while others would escape. The witness knows of no incorporated unions. (19.)

Mr. COATES, president of the Federation of Labor of Colorado, sees no benefit in the incorporation of trade unions, and does not know that the question has been agitated in Colorado. (245.)

Mr. CLARK, of the Western Federation of Miners, thinks that the incorporation of trade unions would be a good thing. (323.)

Mr. SULLIVAN, a metal miner of Colorado, states that some of the local unions of the Western Federation of Miners are incorporated, and that, so far as he knows, incorporation has not produced any bad results. (347, 348.)

E. Strikes and boycotts. (See, as to strikes in western mines, p. v; in eastern coal mines, p. cxxxi.)—1. *Causes of strikes.*—Mr. DAVIS, vice-president of the United Mine Workers, says that the chief general causes of strikes are opposition to the reduction of wages and endeavors to increase wages and to better conditions of employment. Local strikes are often caused by difficulties as to screens, safety and health of mines, etc. (126.)

Mr. PEARCE, secretary of the United Mine Workers, says that demands for increased wages or resistance to reductions, complaints as to the conditions of employment—safety, air, timber, etc.—complaints as to screens and as to docking of wages for loading inferior coal, are among the chief causes of strikes. Overproduction of coal has not been a direct cause, but it has been an underlying cause in many cases. The operators have proposed reductions in wages as necessary because of the low prices of coal, due to excessive competition, and miners have refused to accept such reductions. (91, 92.)

Mr. MCKAY, of the United Mine Workers, says that strikes in coal mining have been caused at times by the lack of a thorough understanding as to market conditions by the miners; by the refusal of employers to allow their men to join unions; by depression of prices and wages to such an extent that miners could not live, though witness does not know that it has ever been the purpose of a strike to reduce production; by difficulties as to screens, especially where changes are made by the operators; as to scales and as to dockage for impurities in coal. (60, 63, 64.)

Mr. STEPHENSON, of the United Mine Workers, says that strikes in coal mining are most frequently caused by reduction of prices for mining. The general strike of 1897 was intended to reduce the supply of coal and force prices up to a remunerative rate. Mining prices in the Pittsburg district had fallen from 79 to 54 and, in some cases, 45 cents per ton. Strikes have also been caused by discharge of men for active participation in trade unions, by difficulties as to screens, and as to time of payment. (21.)

Mr. ROSS, secretary of the Illinois Bureau of Labor Statistics, says that strikes are most frequent, as a rule, immediately after the organization of labor unions, but that as the organizations grow older strikes become less numerous. The most common cause of strikes is dispute concerning wages, but the question of recognizing unions is frequently a cause. The difficulties which formerly arose from the screening of coal have been largely removed in Illinois by the adoption of the run-of-mine system. (181.)

Mr. SULLIVAN, a metal miner of Colorado, says that the causes of strikes are the reducing of the income of labor below the amount that is necessary to maintain the individual, and the attempt to enforce unreasonable conditions, including unreasonably long working hours. (348.)

Mr. SMITH, deputy labor commissioner of Colorado, thinks that the ultimate cause of strikes is that a small class controls land and machinery and inclines to give to labor less than its proportionate share of the product, compelling labor continually to struggle for a larger share. (213.)

Mr. COATES, president of the Federation of Labor of Colorado, says that the great reason for strikes is the competitive system, which makes a continual war between the producer of wealth and the employer. Wage differences are perhaps the chief immediate cause of strikes. Among minor causes he mentions the displacing of men by machinery, and rules and regulations put upon the men for the sake of economy in the operation of large works. The smelters' strike, which was in progress when Mr. Coates testified, was due to the fact that the men believed that the smelter trust was trying to rob them of the benefits of the new 8-hour law. He apparently considers that organization has a certain tendency to produce strikes, by

educating the men to realize that they ought to have a fairer share of the product, though the leaders of labor organizations are opposed, except in extreme cases, to strikes, because they know that they will have to stand the responsibility before the community. (246, 247, 260.)

2. *Methods of strikes.*—Mr. MCKAY says, that in coal strikes the boycott is sometimes resorted to in a restricted sense, for the purpose of limiting the use of a mine's output for local purposes. In 1898 an attempt was made in Pennsylvania to prevent cheap coal from West Virginia from coming in. Picketing, merely talking with men seeking work without violence, is sometimes resorted to, as in 1897 at the mines of the New York and Cleveland Gas and Coal Company. Foreign-born laborers are apt to resort to violence and lawlessness, but not the native born. Sympathetic strikes are sometimes employed; e. g., in 1898 during the strike in the third pool on the Monongahela River, the miners of the fourth pool, who had been loading coal for operators of the third pool, were asked by the organization to quit doing so. (65, 66, 72.)

Mr. MITCHELL knows of no instance in which riots have been precipitated by unlawful interference of strikers, or where men have been intimidated from working. Leaders of miners' organizations have always advised obedience to law. Riots are oftener caused by interference of Pinkerton men and armed guards. (38, 39.)

Mr. DAVIS says that it is the custom for miners' organizations to attempt to prevent men from taking up work in time of strike. The ordinary practice is to send men to meet workmen and to reason with them in a conciliatory manner before they have a chance to reach the mines. Sometimes there may be abusive language or even violence used, but this is discontinued. At Virden during the recent strike the miners who were brought from Alabama were sent back, so far as they were willing, at the expense of the organization. (128, 129.)

3. *Sympathetic strikes.*—Mr. DAVIS, vice-president of the United Mine Workers, thinks that under certain conditions sympathetic strikes may be justified. The injury of one is, in a sense, the concern of all, though it is not good policy to injure all for the sake of one. If railroad unions were to strike for a proper purpose, the miners might, by action in convention, order a sympathetic strike. In many cases the mass of the people are in sympathy with a movement of this kind. (129.)

Mr. PEARCE, secretary of the United Mine Workers, says that sympathetic strikes in coal mining are sometimes necessary. If the miners of one State or district strike, while those elsewhere continue to work, there will be little chance of success in the strike. If the price in one State is reduced, other States will soon have to accept the same conditions, on account of the severe competition. This was the experience of the miners in the Hocking Valley district in 1896, when they were forced voluntarily to accept a reduction in wages because of the reduction in the Pittsburgh district. (95.)

Mr. STEPHENSON, of the United Mine Workers, says that when one district strikes others sometimes follow suit out of sympathy, even though, in certain cases, operators voluntarily increase wages in order to keep them from doing so. (22.)

Mr. MITCHELL, president of the United Mine Workers, regards sympathetic strikes as often absolutely necessary in coal mining, because the capacity of the mines being much greater than the demand, when one district strikes the demand could easily be supplied by the mines of other districts. The operators in the working districts would then share profits with those in the districts under strike. Miners must act together, for where wages are reduced in one district competition will, in time, force the reduction of them everywhere. Conditions must be uniform. (37, 38.)

4. *Effects of strikes.*—Mr. SCHLUEDERBERG, a Pittsburg operator, says that strikes are always injurious to the community, to the employer, and to the employee. They especially injure employers in mines, because fixed charges largely continue while men are idle. Water must be pumped, machinery often must be kept in operation, and interest on investment is a constant factor. (75.)

Mr. ROSS, secretary of the Illinois bureau of labor statistics, thinks that strikes are usually injurious to all classes, but that they are sometimes necessary and beneficial. (181.)

Mr. CLARK, of the Western Federation of Miners, is not clear that the economic results of strikes have been favorable to the workmen upon the whole. He has known of cases in which, though the strike was lost, the economic condition of the worker was materially benefited; and, on the other hand, of strikes which have not been beneficial to the economic condition of the men, though the objects of the strike have been gained. Mr. Clark is not in favor of strikes if it is possible to avoid them by conciliatory measures. He would not go on record against them, but he is in favor of them only as a last resort. He believes that the economic condition of workmen would be worse than it is but for strikes and the fear of strikes on the part of the employers. (325, 326.)

Mr. SULLIVAN, a metal miner of Colorado, says that strikes necessarily cause hardships to the working people and reduce them for the time to a lower plane. Very few are willing to strike, but at times they find it necessary. If they submitted without striking to the conditions that their employers would sometimes force upon them they would be reduced to a state of gradual starvation. The strike is always a last resort. (348, 349.)

Mr. COATES considers that, though strikes may possibly produce bad conditions for a time, they tend to increase wages and otherwise better conditions, and to educate the men as to their real position. In the end, he says, the results of strikes are good to everyone except, possibly, the great capitalists. Without strikes neither organized nor unorganized labor would be receiving the wages they are receiving to-day. (246, 247.)

Mr. MITCHELL, president of the United Mine Workers, says that the miners have never lost anything by general strikes, although in sections they may lose, while the miners in competing districts gain, by supplying the demand left unsatisfied through the strike. General strikes, however, stagnate the business of the country and injure consumers. (36.)

Mr. MCKAY says that strikes in the country at large have been a blessing to all concerned, though for the time being both laborers and employers may suffer. In the coal mining trade it would be impossible to secure joint agreements as to wages with employers except by their fear of strikes. Trade unions do not order strikes except for good cause, nor merely to show the power of organization. (64, 65.)

Mr. DAVIS, vice-president of the United Mine Workers, says that the ordinary method of statisticians in calculating the losses from strikes is to estimate the number of days' labor lost, at the prevailing rate of wages, adding this to the loss to capital through idleness at the prevailing rate of profits. This method is highly inaccurate, at least as to the coal trade, since the days of idleness through a strike do not represent days which otherwise would have been working days, but days which would have been idle because of insufficient demand. Thus, during the great strike of 1897, the average number of days lost was 78; but the number of days worked in 1897 was only from 1 to 13 days less, in the different districts, than in the year 1896, when there was no strike. The amount of coal produced was greater than during 1896; so that probably neither the operators nor the miners lost by the strike. It simply resulted in a change of the time of shipping the amount produced. (126, 127.)

Mr. SMITH does not consider the method of estimating the effect of strikes by simply calculating the losses in wages during the strike, as compared with the gain sometimes secured in wages, to be satisfactory. The most important result in his opinion is the calling of public attention to the fundamental injustice of private ownership of land, and of other existing social conditions. The fear of losses from strikes also frequently prevents employers from lowering wages or resisting the demands of employees. (213, 214.)

5. *Methods of opposing strikes.*—Mr. COATES says that the methods of the capitalist side are very secret, and that they have a more perfect system than it is possible for the workmen, who must deal with a large mass of people, and who depend upon public sympathy, to have. The power of the employers is based especially upon their ability to give or withhold work, and so to destroy a man's credit, to make any little property which he may have valueless, and to separate him from his family and make him a wanderer. (248.)

Mr. MCKAY says that during the strike of 1897 a barrel of liquor was sent to one of the miners' camps on Turtle Creek, but was ordered to be returned to the sender by the witness. He does not know who sent it, but believes it was done at the instance of the employers, with a view to inciting lawlessness among the strikers. (66, 67.)

6. *Injunctions in strikes.*—Mr. ROSS, of the Illinois Labor Bureau, considers the use of the injunction as a means of punishment to be unfair and unjust. It deprives citizens of the right of trial by jury, and gives too much power to one man. It has practically never served the purpose of preventing crime in connection with labor troubles. (183.)

Mr. MITCHELL says that injunctions are regarded by miners as the most dangerous weapon used against them. The use of injunctions has done much to destroy their confidence in the judiciary, and their patriotism. Laws are sufficiently severe to punish crime, and it is no right to assume that miners or any others intend to commit crime. Injunctions have often been in "blanket" form, including all members of an organization, wherever found. They not only enjoin from performance of crimes by those who have shown no disposition to lawlessness, but also from holding public meetings, walking on highways or near mines, and speaking with men at

work or seeking work. Persons have been imprisoned for months for violation of injunctions. (38-40.)

Mr. SULLIVAN, a metal miner of Colorado, thinks that the current use of injunctions is one of the most infamous systems ever practiced in what is supposed to be a republican form of government. He does not think that it prevents crime, or is intended to prevent it, or would restrain a man from committing crime if he really intended to commit it. (351, 352.)

Mr. PEARCE says that the injunction has been frequently employed against miners in time of strike. It is an injustice to presume that a man intends to violate the law, and the injunction has often been used with that presumption when there was no such intention. It is an injustice that miners should be compelled to spend money to defend themselves on trials concerning such injunctions. (96.)

Mr. STEPHENSON says that injunctions were issued extensively during the strike of 1897. That they even enjoined men from walking on highways and meeting other miners. They were, Mr. Stephenson believes, issued in blocks and filled out by other persons. There were some prosecutions for violation of them. (23.)

Mr. McKAY says that the injunction is employed to intimidate miners in time of strikes, and has done much to shake the faith of the laboring people in the law. The witness himself and other officers of the United Mine Workers were enjoined during the strike of 1897 from going near the property of the New York and Cleveland Gas and Coal Company, or from talking with employees in that vicinity. Some agents of the organization were, the witness believes, arrested for violating injunctions, but the matter was settled in court by paying costs. In no case was violence intended or attempted. (66, 67.)

Mr. DAVIS believes that injunctions may be used to curtail the rights and privileges of American citizens. He went to Maryland during the strike of 1894 with the intention of addressing a miners' meeting. The meeting did not take place, but as he was leaving town he was served with an injunction against interfering with the working of the Consolidated Coal Mining Company's plant. He did not know where the plant was or anything about it, and his only intention was to address a public meeting of miners. (132.)

Mr. DALZELL knows of no reason why laboring men who are violating the law, or who are likely to violate it, should not be enjoined from doing so. He believes that most laboring men misunderstand the nature of injunctions and their purposes. (121.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, thinks that the talk about "government by injunction" proceeds from demagogery or from the want of a proper understanding of the use of injunctions. Injunctions are the only effective means of preventing threatened wrongs. Their effectiveness makes them objectionable to the advocates of strikes. Even upon men who really intend to commit crime, the service of the writ would have some deterrent effect in that it would invoke reflection. No one has reason to fear the law unless he has committed a crime or intends to commit one. The objection that injunctions are now used in directions not formerly known to the law is equivalent to saying that the law must not grow to keep pace with the other elements of civilization. It is of course true that mistakes may be made in the issue of injunctions as well as in legislative and executive action, but this happens only in particular cases, and is not a good objection to the general exercise of the power conferred by the law. The witness admits, however, that it is probably the improper use of injunctions which has brought about the cry against them; and he does not think it proper to enjoin men from walking along the public highway or from holding meetings on their own property, unless the meetings amount to a riot or something of that kind. (275, 288, 289.)

7. *Remedies for strikes.*—Mr. BEAMAN does not think that fully cordial relations between employer and employed will come before the millennium. He does not believe that the sources of friction can be entirely removed. (266.)

Mr. COATES considers that there is only one solution of the warfare between the employer and the wage-earner, namely, "a complete change from the competitive system to the cooperative system, or public ownership; that is, the State placing the means of production and the means of enjoying that production in the hands of the individual citizen." Organized labor is working largely along this line; that is, its principal object is to eliminate the competition between the wage-earners, and remove them from the competitive state to cooperative state. (246.)

8. *Boycotts.*—Mr. COATES, president of the Federation of Labor of Colorado, considers the boycott a natural procedure. It is used in Colorado and known as a boycott. There is a law against it in the State, associated with a law against blacklisting; but neither feature of the law has been effective. Only one or two attempts have been made by organized labor, however, since the passage of the law, to enforce a boycott. (248.)

Mr. SULLIVAN, a metal miner of Colorado, says that the boycott is not nearly so effective a weapon for the men as the blacklist is for the employers. When the question is settled the boycott is off, but the blacklist remains. The witness seems to regard the antiboycott law as unjust to workmen. The boycott is not intended to work permanent injury, but only to secure the righting of a wrong by temporary pressure. (350, 351.)

Mr. CLARK, of the Western Federation of Miners, says that he regards the boycott as he does the strike, as a weapon to be used only as a last resort. "If I could not effect a settlement in any other way than by strike, then I would say that I would strike. If I could not make the strike effect a settlement with the employer, then I would apply the boycott." If corporations could be prevented from blacklisting, he would be willing to refrain from boycotting. (327.)

Mr. DAVIS says that the boycott has been attempted only once in a formal fashion by the United Mine Workers in seeking to prevent the sale of nonunion coal. Owing to the wide distribution of coal markets, its success was very questionable, but it was not tried long enough to prove its efficiency. The witness does not consider it wise for labor unions to defy the law, but, if it can be kept within the law, the boycott is justified in extreme cases. It is better to endure wrong than to violate the law. (128.)

Mr. STEPHENSON states that an attempt has been made to influence the public to buy union-mined coal in preference to nonunion-mined coal, especially the unfair product of West Virginia and parts of Virginia and Kentucky. (22.)

F. Joint conferences, conciliation and arbitration. (See also p. cxxxiv.)—1. *Generally.*—Mr. COATES says that conciliation and arbitration are two great principles of organized labor, and are always used to their fullest extent whenever there is a strike. In fully 75 per cent of the cases they are used with good results. Most of the differences, except those with great corporations, are settled by arbitration and conciliation between employers and the committees of the men. Mr. Coates sees little benefit in voluntary arbitration, although it has been used beneficially in some instances. He has not made up his mind whether he favors compulsory arbitration or not. (249, 250.)

Mr. BROOKS believes in conciliation between representatives of labor and capital. Where the parties once become inflamed in their disputes, it is too late for arbitration. Conciliation has usually proved successful in the anthracite region. The witness by reasoning with his men can show them 'he impossibility of paying wages higher than those of competitors. (165.)

Mr. STEPHENSON says the United Mine Workers seek to adjust differences with employers by meeting of joint committees. No permanent arrangement for such committees is made, but it is undertaken in each case as a temporary measure. Compulsory arbitration by State authority is advocated where joint committees can not reach agreements. (23.)

Mr. MITCHELL says that the United Mine Workers arrange with operators for settlement of disputes by joint meeting of representatives. The national executive board of the miners' organization has power to arbitrate. No difficulty has been encountered in securing acceptance of decisions by members. (35, 36.)

Mr. DAVIS says that the United Mine Workers make it a policy to negotiate with their employers by joint committees, and in default of success to arbitrate, the final resort being to strike. Their preference is for arbitration boards selected by themselves rather than for State boards. The witness knows of no instance where the miners have refused to comply with the orders of the arbitrators. (131.)

Mr. SULLIVAN, a metal miner of Colorado, declares that conciliation and arbitration are of no avail under existing conditions. The employers refuse to arbitrate, and when they do submit to arbitration, if the decision is against them, they refuse to obey it. In the Louisville, Colo., coal mining district such a case occurred a little more than a year ago. The witness does not know of any instance in which workmen have refused to accept the award of a board of arbitration. (349.)

Mr. JUSRI, commissioner of the Illinois Coal Operators' Association, declares that arbitration or conciliation ought under ordinary circumstances to be purely voluntary and to be carried on within the particular industry involved in dispute. Moreover, efforts at peaceful settlement of disputes should be undertaken before actual cessation of labor, rather than afterwards. Disputes should be settled as promptly as possible and as near their source as possible. Differences usually arise not so much because principles are in dispute, as because employers and employees misunderstand one another and conduct their negotiations in a bungling manner. It is a benefit to the employer as well as to the employee that wages should be fair and conditions satisfactory. If employers and employees would only get together in friendly conference 95 per cent of their differences could be peacefully adjusted. The witness believes that more and more industrial peace will supplant industrial strife.

The witness thinks that there should be a strong national organization of employers and employees whose purpose it should be to further conciliation and arbitration in all trades. A movement in this direction has already been begun. The National Civic Federation held a conference on arbitration in Chicago in December, 1900, and it was found that representatives of employers and employees were practically in accord in desiring the establishment of methods of conciliation and arbitration. A further conference was held at New York in 1901. A national organization of the sort proposed ought not ordinarily itself to arbitrate or conciliate, but it should endeavor to bring together the leaders of the workmen and employers so that they could agree upon certain principles which could be followed by various other organizations. For example, they could form a public opinion which would be opposed to the use of the sympathetic strike. (686, 687.)

2. *State boards.*—According to Mr. Ross, the State board of arbitration of Illinois has accomplished much good, especially in the way of mediation and conciliation. It has hitherto lacked the power to compel the attendance of witnesses or the production of books, but a recent law has increased its power. It has also been provided that in case of agreement to arbitrate, the decision of the board shall be final, refusal to comply being punishable as contempt of court, although the punishment does not include imprisonment. The board consists of three members and is substantially nonpartisan. The witness thinks that arbitration by State boards is somewhat more effective than by joint committees, although that method is favored also. Compulsory arbitration is to be deprecated unless the interests of the community are endangered by the failure of the parties to agree. (182, 183.)

Mr. HAMMOND, secretary of state of Utah, says that that State has an arbitration law, providing for a board of arbitration and conciliation, whose members are to be paid for the time devoted to such service. The law makes it the duty of the board, whenever it hears of a contemplated strike, to try to adjust the matter. Their services have not been needed since the law was passed. (620, 622.)

Mr. WRIGHT, of the executive board of the Smelter Men's Union, states that in the smelter men's strike the men have submitted their case to the State board of arbitration. At the date of Mr. Wright's testimony the board was investigating the matter. The employers have not consented to arbitration by the board. (307.)

Mr. CLARK, of the Western Federation of Miners, mentions a case in which a demand for advance of wages was submitted to the State board of arbitration of Colorado, and decided in favor of the men, but the decision of the board was repudiated by the employers. This led him to think that the State board of arbitration is of very little benefit to the men, so long as the employers can not be compelled to abide by its decisions. He refers to another case, however, in which a decision favorable to the men was loyally obeyed by the employing company. (324, 325.)

Mr. MULLINS, an Ohio coal operator, says the miners and operators have sought usually to adjust differences by conciliation, and strikes have been resorted to only where this fails. A strike of 1894 in the Massillon district led to the intervention by the State board of arbitration, and finally the disputants agreed to form a local committee of 3 arbitrators. The settlement made, however, was unsatisfactory to the miners, and they did not immediately accept it. The miners are usually ready to accept the intervention of this Ohio State board. (167, 173.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, knows of no case where the miners have agreed to arbitrate and have then refused to obey the decision. In the case of the recent Virden strike in Illinois, however, the operators agreed to submit the matter in dispute to the State board of arbitration, but when the decision was made they refused to comply with it, claiming that it did not cover the ground which they had agreed to arbitrate. (118.)

Mr. Dalzell thinks there is danger that State boards will be subject to political influences, and it would be preferable that the parties to labor disputes should themselves select the arbitrators. (118.)

3. *Enforcement of awards.*—Mr. DALZELL, president of the Illinois Coal Operators' Association, considers strikes injurious both to capital and to labor. They resemble methods of physical conflict and highway robbery. The employer loses on his investment, both by its lying idle and by deterioration, while the employees lose their time. The sensible way to settle differences is by arbitration. The best method perhaps would be to allow the disputing parties to choose their own arbitrators and then to provide for enforcing the awards, provided both parties had agreed in asking for the arbitration. The difficulty regarding arbitration is that the employers, being financially responsible, can be compelled to carry out the awards, while individual laborers and labor organizations can not be effectively held to doing so. The witness therefore advocates the incorporation of trade unions, with a capital stock, which he thinks it would not be difficult for them to subscribe. Unions

could then be punished by fine for failure to obey orders of arbitrators, and as a last resort their charters could be taken away. The witness would advocate compelling trade unions to incorporate, and thinks this would be just since they have many of the characteristics of trusts or combinations of capital. Incorporation of employers' organizations would not be necessary, because the individual employers are responsible. At present agreements as to wages, etc., are usually signed by the employers individually, but only by representatives of the trade unions. (116, 117.)

Mr. PEARCE, of the United Mine Workers, says that the agreements between the United Mine Workers and the coal operators provide for conciliation or discussion by joint committees as to points of difference, and for arbitration where necessary. The State boards of arbitration have worked satisfactorily, although the mine workers have not found it necessary to resort to them. Compulsory arbitration might be desirable where a strike of miners would interfere with the business of the country, but usually public opinion is sufficient to enforce the awards of the arbitrators. (96.)

Mr. MITCHELL thinks that State and national boards of arbitration should be established with power to investigate any dispute between employers and employees on request of either party, compelling testimony. Award should not be compulsory, but public sentiment would usually practically enforce it. Compulsory awards are objectionable because employees would have ultimately to be imprisoned to compel obedience, and because unwarranted demands on each side would be encouraged. (35.)

4. *Compulsory arbitration.*—Mr. CALLIS, county attorney of Summit County, and formerly a coal miner, says that Utah has an arbitration law, and that it was once put in force in a difficulty over some public works, but he has never heard of its being used in any difficulty among the coal miners. He does not believe that compulsory arbitration is desirable at the present time, though we shall gradually come to it. It would be a good thing, in case a mine owner said he could not work his mine at the wages fixed by an arbitration board, that the court appoint a receiver to see if the court and the people could not work the mine at a profit. The conditions are probably not ripe, however, for such a step. (634, 635.)

Mr. SULLIVAN, a metal miner of Colorado, thinks that compulsory arbitration would save strikes, lockouts, and large expense and hardship to the employees. If the award was against the employer, and he took the ground that he could not run his mine at a profit, and therefore closed it down, the State should take the property under the right of eminent domain and run it for the people. (351.)

Mr. CLARK, of the Western Federation of Miners, thinks that "even if it does interfere with our individual liberty a little, we ought to be willing to have a law passed compelling employee and employer to submit their differences to a board of arbitration and to compel them to abide by the decision." He seems to have chiefly in mind the desirability of compelling employers to submit to the award of arbitrators. (329.)

Mr. SMITH, deputy State labor commissioner of Colorado, declares that strikes are a form of warfare and involve the destruction of wealth, or at least cessation of production. The interests of the general public are almost always involved, and the witness sees no reason why the parties should not be compelled to submit their differences to an impartial tribunal and abide by its decision. No person is privileged to do exactly as he wishes. Although compulsory arbitration might at first tempt one side or the other to make frivolous complaints, the established tribunal could refuse to consider such complaints altogether and would thus ultimately check them. In the last analysis compulsory arbitration means the settlement of wages by law; but Mr. Smith thinks this would be acceptable to organized labor. (215, 216.)

Mr. JUSTI, commissioner of the Illinois Coal Operators' Association, says that the conferences on arbitration held under the auspices of the National Civic Federation have been opposed to compulsory arbitration, and have also preferred the work of trade boards of arbitration and conciliation to that of State boards. The decrees of State boards under present laws can not be enforced, and are therefore of little value. These boards are not respected as trade boards are. The Illinois board of arbitration has not had a single case referred to it by the joint action of employers and employees during the past year.

The witness thinks that ordinarily public opinion is powerful enough to compel the one party to a labor dispute to enter upon conciliatory measures or to submit to arbitration in case the other party shows itself willing to do so. In the case of quasi-public corporations, the interruption of whose service has a serious effect upon the public, some legislation may be necessary to compel the parties to endeavor to conciliate, or at any rate to provide for compulsory investigation as to the causes of disputes. In no case would the witness have compulsory arbitration with enforcement of the decision. (687, 688.)

Mr. LEE, commissioner of mines of Colorado, is opposed to compulsory arbitration. The parties concerned understand the question at issue better than outsiders. A man who has a large investment does not want some third party who has no interest to decide for him what he shall do. (232.)

Mr. MCKAY, of the executive board of the United Mine Workers, declares that his organization favors arbitration by joint committees and by State boards, but not compulsory arbitration. (66.)

On the other hand, where many people besides the parties to the conflict are interested in a labor trouble, Mr. DAVIS, vice-president of the United Mine Workers, thinks it is justifiable to compel arbitration and also to enforce the award of arbitrators by compulsion. A penalty might have to be inflicted on men who refuse to work according to the terms prescribed. The witness knows of no case, however, where miners have not complied with the decrees of arbitrators without compulsion. (131.)

G. Hours of labor (see also *Hours of labor under Labor in Western mines*, p. LXXII, and under *Coal mining*, p. CXXX).—Mr. MITCHELL, president of the United Mine Workers, thinks that laws should be enacted establishing a universal 8-hour day. It would give workmen opportunity to develop and improve themselves and would give employment to many, thus preventing crime and other evils. The best method of accomplishing this result would be for the Government to limit the hours on all public work to 8, and to purchase only products produced under the 8-hour system. (47.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, believes that no question is now so important to the workmen as an 8-hour working day. He apparently considers that the 8-hour day should be obtained, if possible, even if somewhat serious concessions in wages are necessary. (321.)

Mr. TERHUNE regards a universal 8-hour law as one of the remedies for unemployment. (600.)

Mr. CLARK, of the Western Federation of Miners, believes that men ought not to work overtime unless in case of emergency. (330.)

Mr. SMITH, deputy commissioner of labor of Colorado, thinks that where workmen make a practice of working 7 days in the week it soon comes about that they get no more pay than if they work only 6. (220, 226.)

H. Employers' liability.—Mr. ROSS believes that there is need of uniform laws regarding the liability of employers, and favors their enactment by Congress. The development of industrial interests increases the need of protecting the laborers. The courts apply the doctrine of fellow-servants and of contributory negligence to such an extent that it is almost impossible to enforce liability under the common law. (189, 190.)

Mr. SCHLUEDERBERG, a Pittsburg operator, believes that at some future time it will be best for the employers or the people generally to be taxed for the payment of benefits to injured employees, but that the time is not ripe for this change. At present the situation in Pennsylvania is fairly satisfactory for the employees, since under the mining laws great precaution to secure safety must be taken by the operators, in default of which they become liable for injuries. (88.)

Mr. DALZELL, president of the Illinois Coal Operators' Association, deprecates any attempt to compel the employer to assume the ordinary hazards of employment, especially where accidents may be due to the neglect of the injured employee or to his violation of laws or rules. But laws for protecting life can not be too stringent. (114.)

Mr. COATES, president of the Colorado Federation of Labor, has not seen any great benefits coming from employers' liability laws, because the employer generally compels the workman to have himself insured at his own expense, and to relieve the employer from liability. This is a hardship on the employee. He should be allowed to insure himself in his own way. Many have insurance in fraternal organizations. Mr. Coates does not consider, however, that it is through a defect in the law that employers are able to escape liability. The experience of labor in various States has been that it is hard to make the law effective. Organized laborers, however, desire such a law. (258, 259.)

I. Cooperation.—Mr. COATES says that there is some industrial copartnership in Colorado, largely in retail stores. The results seem to be satisfactory, and such enterprises perhaps bring better conditions. The system is not operated to any extent in the State. He wishes it was. (257.)

According to Mr. SMITH there have been several cooperative experiments in Colorado, especially cooperative stores. There is at present a cooperative colony at Pinon which has met with fair though not perfect success. In the cattle business, although

there is no common ownership, there is considerable cooperation in herding the cattle. (221.)

Mr. CLARK, of the Western Federation of Miners, states that two coal mines have been worked on the cooperative system in Colorado with very good results. The miners did not own the land, but they leased it on a royalty. One of these mines was bought out, both the land and the lease, when the Northern Coal Company was formed. The other is still running on the cooperative plan. (334.)

Mr. ALLEN states that there is no cooperation in mining in Utah, except possibly in prospecting and developing a mine. There are stores in Utah which are called cooperative, but they are really stock stores. (572.)

Mr. SULLIVAN, a metal miner of Colorado, believes that it would be well if the workingmen would cooperate with regard to everything that they use and handle. It would be more beneficial, however, if the Government would undertake it. There is not, he believes, a fair illustration of a cooperative enterprise in Colorado. (355.)

Mr. MITCHELL, president of the United Mine Workers, says that his organization has taken no definite ground in favor of productive cooperation, but it favors cooperative stores, and allows members of cooperative mining companies to retain membership in the organization. Miners have often established cooperative stores, but where they compete with company stores those who patronize them often find their conditions of employment made unfavorable. (44, 49, 50.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, does not think that cooperation can be put on a practical and successful basis by making workmen either joint partners or stockholders, for three reasons: (1) The dividends are usually below the local interest rates, and would not be acceptable to small capitalists; (2) there are times of loss when loans can not be procured and owners must put up their own money to save the business; (3) Nearly or quite 90 per cent of business enterprises result in failure and either total or partial loss of the capital involved. Hence it is too risky. Cooperation would be a good thing for the employer if it were practicable. (281.)

J. Profit sharing.—Mr. ROBINSON is inclined to believe that there will come more general arrangements for a division of profits with the laborer. The Campbell's Creek Coal Company has such a system, and it works well. (17.)

K. Labor-saving machinery—general effects (see also pp. XLII, LXI, CXVI).—Mr. WRIGHT, of the executive board of the Smeltermen's Union, says that the smelter workmen have not received any benefit from labor-saving devices, either in the improvement of their health or in the lessening of their burdens. Machinery reduces the labor, but it is not always a benefit to the laboring men. It reduces permanently the chances for work. The witness admits that the demand for products, and so the demand for labor, is increased by the cheaper production which machinery makes possible, and that in the end the tendency may be to shorten the hours of labor and to raise wages. He thinks that profits must be increased by labor-saving machinery, but that the men are not receiving their proportion of the benefits, except as to the higher skilled labor required to run the machinery. He seems to attribute the advance of wages, which he admits to have existed upon the whole, chiefly to increasing education and skill. (314, 315.)

Mr. SMITH believes that machinery tends to throw employees out of work temporarily, and in most cases permanently, and also to make the individual much more dependent upon others. A reduction in the hours of labor should go along with improvements in machinery. (226.)

Mr. TERTINE considers that labor-saving appliances diminish, on the whole and permanently, the demand for labor. (605.)

Mr. ROSS believes that the larger use of machinery increases employment and wages and tends to decrease the hours of labor. He speaks especially of the effects of improved printing machinery. The cheaper cost of production by machine methods creates a great demand for products and increases employment in the industry itself and in the subsidiary industries dependent upon it. The United States census shows a marked increase in employment and wages from 1880 to 1890. (186, 189.)

L. Drunkenness and the liquor traffic.—Mr. MARCY, an independent anthracite operator, says that it is hard to get work done for a day or two after pay days and holidays. He has known drunkenness to be so general that it has been impossible to operate the mine. It is more noticeable among the Hungarians and Slavs and Poles, because they are more numerous; he is not prepared to say that they are more given to it in proportion to their numbers than other nationalities. He does not know that the irregular hours of work promote drunkenness. It depends on the man. If a man wants to get drunk, he will. Drunkenness is more

characteristic of the inferior class of miners whose annual earnings are very low. Lost time and inability to work keep their wages low. A man who earns only \$300 a year, though he has a family to support, may go on three drunks a month. The children of these shiftless miners generally work to help out the family expenses, and often the wives also. They may have a boarder or two. (671, 672.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, states that though the habits of the miners do not greatly differ from those of other laboring men, or even of the population as a whole, the temptations of the saloons are the cause of much idleness and loss, and of much suffering to the families of the men. If the legislature would prohibit the sale of intoxicating liquor at or near the mines, it would do more to promote the general welfare of the miners than any other law that could be passed. (276, 277, 289.)

M. Remedies for unemployment.—Mr. TERHUNE suggests as a chief remedy for unemployment a universal 8-hour law. He would also diminish the number of acres of public land that can be entered under the free homestead law. He thinks that the increase of the Army has contributed to diminish unemployment. (600.)

N. Small value of legislation.—Mr. CLARK, of the Western Federation of Miners, has no faith in legislation as a means of benefiting workmen. He believes that the only way for the laboring people to get anything is through organization, and that through organization they can succeed in enforcing their demands. (334, 338.)

O. Workmen in public office.—Mr. CALLIS, county attorney of Summit County, and until recently a coal miner, says that the miners and laborers have had a very fair representation in the two last legislatures of Utah. He himself was a member two years ago. (632, 634.)

VII. MISCELLANEOUS QUESTIONS.

A. Industrial combinations (see also *American Smelting and Refining Company*, p. XLIII; *Colorado Fuel and Iron Company*, p. XLVI; *operations of the Standard Oil Company*, p. XLVII; *Combinations, under Conditions of the coal trade*, p. CXII). 1. *Effects generally.*—Mr. TERHUNE, a mining engineer, believes that a great industrial combination like the smelter trust, if freed from competition, might lower the wages of labor, and would not offer the same incentive to improvement and invention as competing concerns. He is unfavorable to any condition that prevents competition and artificially raises prices, but does not think that all consolidations have done these things. The growth of large businesses is an element of progress, and we can hardly forbid a man to do a large business instead of a small one. The great combinations can effect the same production with less expense and with less labor. If men are thrown out of employment by them, make the 8-hour law universal, and absorb the men again. (599–601.)

Mr. Terhune states that the cause of the formation of the smelter trust was extreme competition. Rates for the treatment of ore had been so reduced that they would hardly cover the expenses. (600, 601.)

Mr. GRANT, of the smelters' trust, in connection with his discussion of that organization, declares that combinations generally are likely to be beneficial to capital and to labor as well. Combination is the economic tendency of the age and can not be prevented. It is necessary to avoid ruinous competition and to enable capital to get a reasonable interest. Where competition is unduly active, expenses have to be reduced on all sides; labor and the producers of raw material suffer. Economies can be made by combination, and to some extent prices can be regulated, although not necessarily increased to the consumer. (195, 196, 201, 202.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, states that the consolidation of an industry to the exclusion of all competition would be bad, but that he considers a consolidation of from 60 to 70 per cent of the production very good. It does not wipe out competition, and at the same time it cheapens production. A concern controlling 70 per cent of an article is not in a position to control competition. The other concerns, which use the other 30 per cent of the raw product, are in the market and operating continuously, and if prices go up they will increase their plant; so that there will be a prompt and effective competition to restrain excessive charges. The Standard Oil Company, the sugar trust, and the whisky trust are regarded by the witness as instances of combinations that have had such favorable effects. It is true that these trusts have crushed competitors out of business; but in those cases there has been no margin in production, and the rest of the people have had the benefit of the lower prices. "As soon as the trust crushes

out all opposition and raises prices, so that there is a better margin and a good investment, competition starts up again, and the prices consequently go down." Besides, credit must be given for the enormous amount of capital invested, for the time lost in building up the business, and for the brains and intelligence of the people who control trusts. "All that a trust demands, as a rule, and under proper conditions, is a certain interest on its investment, and when it gets that it is satisfied." (301, 303, 304.)

The most important combination of capital in the mining business in Colorado is the Colorado Fuel and Iron Company. Mr. SMITH, deputy State labor commissioner of Colorado, has no doubt that it has closed mines less advantageously situated, and that to some extent competing producers have been unable to operate their plants on account of the superior advantages of the combination. Generally speaking, the witness thinks that combinations are likely to enable their managers to control the prices of products and to depress wages, while the conditions under which workmen get employment are made more difficult. It is undoubtedly the duty of the State to control trusts and all forms of monopoly. (225.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, thinks that the current denunciation of trusts is largely insincere and the result of political ambition. The trusts are organized and carried on by the political leaders whose platforms condemn them most severely. The witness mentions various combinations, including those of the potato and melon growers of Colorado, whose products have declined in price since the combinations were formed. It is true that trusts buy up concerns and close some of them and throw people out of employment; but since 90 per cent of business enterprises have failed from overcompetition and overcapitalization, not only throwing men out of employment but leaving them and their creditors unpaid, he thinks that the closing of some establishments by the trusts is not the worst possible disaster. Nor is the increase of prices invariably or generally bad. Too low prices mean correspondingly low wages and consequent hardship for the workmen and inability to buy supplies, so continuing the chain of evil around the circle of business. The witness does not claim to know and does not believe anyone knows whether in the long run the trusts will work for good or evil. (282.)

Mr. HILL, a smelter operator and oil refiner of Colorado, regards the control of vast industries by a few as extremely dangerous to the general welfare. The purpose of it is to increase profits, and he believes that the effect is to raise prices, to lower wages, and to increase the congestion of population in great cities. (373, 374.)

Mr. Hill believes, however, taking the city of Denver as an example, that street railways can be better operated by one company than by two. (388.)

Mr. DAIKELL, president of the Illinois Coal Operators' Association, deprecates the attempt to form any combination or trust in the coal-mining business. He believes that all combinations tend ultimately to throw many men out of employment, especially accountants, salesmen, and managers, and also common laborers; to destroy competition, and raise prices. They are a danger to American institutions. (114.)

Mr. COATES, president of the Colorado Federation of Labor, says that every present tendency is toward concentration of wealth in the hands of a few, and that trust combinations have a tendency to increase this concentration. He does not consider concentration of ownership bad in itself. If ownership were concentrated in the State, he believes that such concentration would be beneficial to the whole people. There would be the same concentration of management that we have now, but an equal and beneficial distribution of the product. The evil is in the ownership of the product by a few individuals. (255.)

Mr. ALLEN, a Utah mine manager, believes that the formation of trusts lowers the cost of production and is a forward step in commerce and industry. The important question is, Who shall control the trust, and for whose benefit? Regulation might control the material evils of trusts, but would not affect the greatest damage which they do under existing conditions, namely, the closing of opportunities for superior men. Mr. Allen holds that in order that all the people may have a chance to rise in these lines of industry, as well as that all the people may share the benefits of the economies which the trusts effect, it is necessary that the people as a whole own the industries and the trusts. Only in this way can they be managed for the benefit of all, instead of, as now, for the benefit of a few. The people will reason in this way in time, though Mr. Allen hardly expects the change to come in his day. (574, 575.)

2. *Effects on labor.*—In connection with a discussion of the existing strike against the smelters' trust, Mr. GRANT, its general manager, expressed the opinion that combinations generally are beneficial to labor, since they prevent the undue competition which forces economy by the cutting of wages. He admits, however, that the general policy of combinations, as of other employers, is to pay the lowest wages possible

for a given quality of service. Of two men equally skilled the employer will take the one who will work for less wages. The witness also admits that the combination is probably strong in meeting its employees and more able to dictate to them than individual employers. The tendency is to consolidate production in large plants, for the most part in cities. To meet the combination of capital combinations of labor are perhaps necessary, and, if reasonably conducted, the witness inclines to approve of them.

On its being pointed out that the tendency of combination under the conditions described would apparently be injurious to labor, both by depressing wages and by increasing the prices of articles of subsistence, Mr. Grant declared that after all employers do give some consideration to the feelings and the welfare of other men and do not fix wages strictly on a competitive basis. This, he thinks, was notably true in the case of the smelters during the long period of depression after 1893. Wages were reduced only 10 per cent, although the smelters were making nothing. (197, 202, 203, 206.)

Mr. WRIGHT, of the executive board of the Smeltermen's Union, states that he believes the smeltermen's strike in Colorado in 1899 would not have happened if the American Smelting and Refining Company had not been formed, consolidating the ownership of the greater part of the smelters. It was only with this combination, and not with individual smelters outside of it, that trouble existed. Mr. Wright thinks that the trust smelters could run on the 8-hour system, as other smelters are doing, and that they would have done so but for the trust. His experience has always been that the owners of individual plants are accessible to their men and habitually manifest a desire to meet their wishes. It is much more difficult to treat with a great combination, whose heads are beyond reach. Even the managers upon the ground seem to be less accessible than they were under the system of individual and separate ownership, though they are the same men. (311, 312.)

Mr. COATES, president of the Colorado Federation of Labor, thinks that it is much more difficult for workmen to deal with very large concerns than with smaller ones. They can usually reach the head of the individual concern, and when they can get a conference of that kind it is only a question of time when a satisfactory settlement can be made; but the heads of a great trust are usually at a distance and can not be reached. The officers on the ground will only say that they have certain instructions and can not depart from them. Labor is left almost powerless. Friction in one place is likely to spread through the whole body of employees of the combination, and Mr. Coates thinks that many strikes and controversies have grown out of these conditions. (256, 257.)

Mr. Coates thinks that the formation of the smelters' trust will not have beneficial results to anyone but the stockholders. He believes that great combinations in general are disadvantageous to the employees. If a man becomes distasteful in one plant he can not get employment in any other. He thinks that this organization even brings influence to bear upon outsiders whom it has business relations with—for instance, upon the railroads—to prevent them from employing the distasteful employee. In the case of the smelters' trust probably 50 per cent of the men know no other trade. To dismiss them would be to reduce them to the position of common laborers. A considerable proportion of the smelter workers in Pueblo have built permanent homes; more than in any other vocation. If the Pueblo plants should be closed by the trust these men would be reduced to common laborers, and if they could not get common work in Pueblo they would have to move. The formation of such combinations, with their tendency to close particular plants, is a great discouragement to the building of homes by workmen. The power to close particular plants gives the trust an advantage over their men and enables them to exert influence on business men.

Mr. Coates mentions the town of Overton, which was built up a few miles from Pueblo by the placing there of an oil refinery and oil tanks after the discovery of petroleum in the Arkansas Valley at Florence. It was a flourishing little town of several hundred people. The independent oil company was forced into the Standard Oil Trust, and its plant was closed for purposes of economy. The value of the property in Overton was destroyed; all the inhabitants had to move away. Mr. Coates has no positive knowledge that the Standard Oil Company controls the company which operated at Overton, but says: "It is in the combination; there is no question about that."

The formation of combinations tends also to hasten and increase the concentration of wealth in the hands of a few individuals, a concentration to which all the circumstances of the time are tending. (254-256.)

Mr. CHAMBERS, a Utah mine manager, fears the result of combinations of mines and smelters, and thinks that there should be some national legislation upon the subject. In the absence of effective legislation, he fears that there will be a gradual encroach-

ment upon the well-being of the employees of the mining districts, and that a tendency to anarchy will follow. (589.)

Mr. JOHNSON, a Colorado oil producer, believes that the tendency of industrial concentration is to the congestion of laboring people in great centers, and that the social effect of such congestion is bad. (344.)

Mr. LEE, commissioner of mines of Colorado, thinks that combinations have tended to lower wages and injure labor. He believes that it would be desirable to have Government inspectors to examine their accounts, and that watering of stock should be restricted. (241.)

3. *Overcapitalization—Evils and remedies.*—Mr. CHAMBERS, a Utah mine manager, thinks that laws should be enacted to prevent the overcapitalization of corporations. It should not be possible for companies to conceal in this way the ratio of their earnings to their actual investment. (590.)

Mr. ALLEN, a mine manager, considers that the only serious harm that results from overcapitalization is the compelling the people to pay the interest on the excessive amount. A corporation that is earning 30 per cent on the capital invested should not be permitted to issue fictitious capital and reduce its apparent earnings to 6 or 8 per cent. If the company's earnings are exorbitant, the people ought to know it. Capitalization ought to be controlled by law. (579.)

Mr. HILL, of the Argo smelter, thinks that if a company is interested only in the conduct of its business, and not in stock dealing, it makes no great difference to it or to the people what its capitalization is. For purposes of stock dealing a high capitalization seems to be found advantageous. But in the case of a smelting company, or even in the case of a street-car company, Mr. Hill does not see what difference it makes to the man who deals with the company whether the stock is a million or ten millions. On the street cars the fare is 5 cents anyway. A railroad company has the power to impose such rates as may be for its interest, regardless of its capitalization. He has been accustomed to think that competition is the force that should be trusted to secure fair and reasonable charges. He admits, however, that watered stock would tend to put a pressure upon the management of the company to increase its income for the purpose of paying dividends. The existence of watered stock is likely also to deceive the public as to the reasonableness of the dividends. A dividend of 5 per cent looks reasonable and a dividend of 50 or 100 per cent seems exorbitant. The average man will not consider the actual basis upon which the dividend is reckoned. It is said that the dividends of the Illinois Central, nominally 6 to 8 per cent, have been 22 to 36 per cent on the actual investment. But those who build a railroad take the chance of loss, and if they succeed it would hardly be fair to restrict them to ordinary interest. (372, 382-385.)

Mr. Hill points out that the phrase "watered stock" may convey very different ideas. For instance, the Western Union Telegraph Company has \$100,000,000 of capital, which represents no investment at all. The witness believes that \$100,000 was originally invested by the company, and all the rest has been accumulated out of the earnings, in addition to good dividends. This large amount of stock may, therefore, be said, in one sense, to be water. It is not water in the sense that the property is not worth it. (382, 383.)

Mr. Hill thinks it would be difficult to prevent stock watering by law. A mine may be worth \$10,000 or \$1,000,000; no one can tell. A company can not be prevented from taking a mine at a valuation of \$1,000,000 if it chooses. The case is different with things whose value is fixed by actual expenditure. It would seem possible, for instance, to prevent the issue of watered stock by a railroad company. He would like to see companies prevented by law from issuing capital stock beyond the money actually invested in the business. (383.)

Mr. Hill would be glad to see a trial of a system of Government inspection of corporations, similar to the inspection of national banks, with provision that if any corporation was found to have watered stock its stock should be reduced. (384.)

Mr. GRANT, of the smelters' combination, does not believe that overcapitalization of combinations is especially injurious. No one is deceived, and if too much overcapitalized the combination will simply not pay dividends. Legislation to prevent abuse would not perhaps be injurious, but speculation could not be stopped by it. There is no way of keeping people from buying stock. Moreover, the witness believes that it is justifiable to capitalize future possibilities. Just as there is an unearned increment of value in real estate, so a corporation which has an advantageous situation or a growing business will find its property increasing in value. This has been the case with railways. In most cases the common stock did not originally represent value, but frequently with the development of the country it has become valuable. The corporation itself often builds up communities, and is entitled to the increment in value which comes with population. (200-202.)

Mr. SULLIVAN would have corporations taxed upon the basis of their capitalization. He regards this as one remedy for stock watering. (363.)

4. *Remedies for evils of combination.*—Mr. HILL is not prepared to suggest any general remedy for the evils of industrial combination. Combinations in the narrower sense might be prevented by law, but it is hard to see how a man or a company could be prevented by law from buying up all the plants in a given industry. (374.)

Mr. TERHUNE, a mining engineer, believes that the large consolidations have come to stay, and that the chief remedy for their evils is to be found in competition. Large businesses are not in themselves injurious, and competition may be depended upon to rise to prevent abuse of their power, provided railroad discriminations do not prevent it. (600, 601.)

Mr. HAMMOND, secretary of state of Utah, says that that State has a law forbidding combinations to control the prices of the necessities of life. There has been one prosecution in the State relating to the combination of the coal dealers to control the price of coal. The witness is not certain whether the prosecution was under State or Federal law. (620.)

Mr. CHAMBERS would approve of a law to prohibit the selling of products at a price below the cost of production for the purpose of driving a rival out of business. (590.)

Mr. GRANT, of the smelters' trust, thinks that legislation against combinations is undesirable. It is impossible to regulate any line of business without either injuring the smaller producers or making open discrimination and legislating against large capital as such. The witness admits, however, that corporations are artificial persons created by the legislative power, and that therefore it is not radical for the legislative power to seek to control and inspect them. He admits also that in certain cases legislation is perhaps desirable, although he thinks it unnecessary in connection with the smelters' combination. (195, 196, 201, 202.)

B. Freight rates.—(See also *Discriminating freight rates on mining products*, p. XLIX; *Freight rates*, under *Coal mining*, p. CXI.)—Mr. TERHUNE considers that a carload shipment ought to be carried at the same rate as a train-load shipment, though it is to be recognized that there is a little more clerical work and a little more train service connected with carload shipments than with a train-load shipment. The carload man should be recognized for the safety of our institutions. (599.)

Mr. HILL would go to any extent in strengthening the law to prevent discriminations. He would make a carload the unit, and would not permit railroads to charge any company more or less for hauling goods than it charged anybody else, no matter how great the shipment.

Mr. SULLIVAN does not believe that discriminations in freight rates can be stopped except by Government ownership of railroads. The Government, owning the roads, should carry 100 pounds of freight at the same rate as a carload. (362.)

Mr. CHAMBERS would be glad to see the Interstate Commerce Commission given absolute power to prevent freight discriminations. (590.)

C. Government ownership of industries.—1. *Telegraphs and railroads.*—Mr. HILL, a former member of the United States Senate, states that he believes that the Government of the United States should own the telegraph system. An investigation by the Post-Office and Post Roads Committee of the Senate, under his leadership, established clearly, he believes, that a Government telegraph could send messages throughout the United States at a uniform rate of 10 cents for 10 words, just as letters are now sent at a uniform rate of 2 cents, and be self-sustaining. When Mr. Hill found that he could not get support in Congress for a Government telegraph, he introduced a bill for Government control of the service, with transmission of messages by private companies. Just as the mails are actually transported by railroad companies, so the bill proposed that telegrams should be actually transmitted by the telegraph companies, but should be collected and delivered, as the mails are, by the Government, and at charges fixed by the Government. There was strong competition at the time between the Western Union Telegraph Company and what is now called the Postal Telegraph Company. Mr. Hill proposed that the transmission of telegrams should be done under contract at rates to be determined by competitive bids, but not exceeding a certain fixed maximum. The bill was favorably reported to the Senate, unanimously, and put upon the calendar. But it was late in the session, a fact due to men who are very skillful in the business of defeating bills; so it never came to a vote. Mr. Hill remarks that there is not a single country in Europe where the telegraph is not controlled by the Government, and states that in France there is a 5-cent rate for 10 words, and that 10 cents is the maximum and that the system has been made self-sustaining. (383, 384.)

Mr. CALLIS believes that Government ownership of railroads and of the telegraph service will be established. (635.)

Mr. TERHUNE would regard the Government ownership of railroads with apprehension, though he admits it might work well. (598.)

2. *Industries generally.*—Mr. SULLIVAN, a Colorado metal miner, believes that the Government should establish postal savings banks, and should own the railroads, the telegraphs, the telephones, the coal mines, and manufacturing plants of all kinds. Cities and towns might very properly own their electric and gas plants and water works and street railways; but it would be well for the General Government to own all these things, at least in cases where cities and towns can not afford to provide them. Indeed, there is no industry which the Government could not take up with advantage. (361-363.)

Mr. CLARK, of the Western Federation of Miners, believes that "a man is entitled to all he produces." That is, the coal miner is entitled to the full market value of the coal he brings out. A man can not get it under the present system, but things would be different if the State operated the coal mines and everything. The equipment of industrial enterprises would still have to be maintained out of the product; but Mr. Clark would be willing to submit to necessary deductions from his full product if the majority of the people reaped the benefit. Production would be cheaper under State operation of industry, and the consumer would not be charged an exorbitant price. The State would produce cheaper, because it would not demand the exorbitant profits which the operating companies now collect from the public. (330, 331.)

D. Schools and educational facilities.—1. *Effects of education.*—Mr. PEARCE says that the public schools are improving the character of the rising generation so that it will be less servile. There should, however, be provision for night schools, since many older boys work in the mines during the day, and in any case would not be willing to go into schools with younger children. (101, 102.)

Mr. TERHUNE says that universal education will bring many things to the common level. It results in less dependence upon manual labor and more dependence upon the forces of nature. There will be a tendency to lower salaries and lower wages. The exceedingly high salaries of the most efficient men will not cease to be paid, for education can not create genius. Mr. Terhune does not wish to be understood as supposing that the inequalities of the distribution of wealth will be increased by general education, but rather that there will be an improvement in the distribution of the products of labor. (593.)

Mr. WRIGHT, of the Smeltermen's Union, has known some young men who went through manual-training schools and improved their chances by it. Manual training is the most valuable branch of education for laboring people. He believes, however, that education in the democratic public schools is going to bring all classes of society together in time; "that it will take the poorer classes up to the highest." He implies that the majority of the laboring men's children quit school with the fifth or sixth grade. Many get through the grammar schools, and even the high schools, but this is not the rule. (308, 315, 316.)

2. *School facilities.*—Mr. WRIGHT, of the executive board of the Smeltermen's Union, Denver, states that smelter laborers exhaust every means to have their children go to school as regularly as the children of any other class of citizens. The witness thinks that Colorado has the best system of schools that he knows of. Schoolbooks are not free in Denver. Mr. Wright thinks that the education of laborers is improving. (308, 315, 316.)

Mr. SMITH thinks that the schools in most Colorado towns are equal to the best, and are very beneficial in their effects upon the education of the working classes. He believes, however, that manual-training schools, which have as yet been established in few places, should be made general. He also believes that every city should have free libraries and reading rooms. (222.)

Mr. COATES says that if children were not forced to go to work to maintain themselves and their parents the present school facilities of Colorado would be inadequate. As it is, they are generally sufficient, and the school system of Colorado is on a high plane. Much that is taught to the children in school, however, is of no use to them, and much that would benefit them is left untaught. (258.)

Mr. SULLIVAN, a metal miner of Colorado, believes that the school system might be improved by building more schools and lessening the crowding of the children. He also believes that more attention ought to be given to the dispositions and capacities of the individual children, with a view to giving each the particular training which is best suited to his particular abilities. To this end he would have every child examined by a competent professor of phrenology. (355, 360.)

Mr. LEE says that Colorado prides itself on having the best school system of any State of its size, although he thinks there should be more manual and mechanical training. There are also public libraries and reading rooms in many towns, and miners, even in the remote districts, read a great deal. (235, 243.)

Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, says that at all the company's mines there are schoolhouses of a character corresponding to the number of the population, some of them being the best in their counties. The company gives the lots and furnishes a large proportion of the cost of building, both by taxation and by donation, and always encourages the building of sightly and commodious structures. The witness quotes at length a newspaper item giving a very flattering account of the appearance and work of the schools at the mining town of Sopris. (278, 279.)

Mr. NEWHOUSE, manager of the Philadelphia Smelting and Refining Company, Pueblo, Colo., states that the workmen do not greatly care whether they send their children to school or not. There is a school near the works. There is no accessible library except the city library. (298.)

Mr. HILL states that there are excellent schools in the vicinity of the Argo smelters, and that the children of the workmen attend them almost without exception. (377.)

Mr. HAMMOND, secretary of state, of Utah, says that that State collected a little over \$1,200,000 in 1898 for school purposes, besides the expenditures for the State university and the agricultural college. School attendance is compulsory for children between 8 and 14 years of age for 20 weeks each year. There are a few private schools to which parents may send their children. Children between 6 and 18 may attend the public schools without tuition fee. In the principal cities the necessary books and apparatus are supplied without charge. Mr. Hammond estimates that 90 per cent of the children attend the public schools. (621.)

Mr. TERHUNE says that the public schools of Utah are of a high standard, and that the miners and smelters generally send their children to them. He attributes to the schools a marked influence in raising the general social condition of the workmen. He has some faith also in the democratic tendencies of the common education of the rich children and the poor. (592.)

Mr. CHAMBERS states that there are good schools throughout his mining district in Utah, and that the miners' children generally attend. He believes that the school system has exerted a marked influence in bettering the moral and social condition of the mining communities. (585.)

Mr. HANAUER states that in former times his company contributed outside of taxes to the support of the schools in the Bingham district. It does so no longer. It appears that the school tax in Utah is now distributed pro rata throughout the State. (611.)

Mr. THOMAS, State coal-mine inspector of Utah, states that there are good schools near the coal mines generally, and that the children of the miners usually attend. The education of the children of all classes of society together has a good social effect. (626.)

Mr. HAMMOND says that the manual-training department of the State Agricultural College of Utah is usually taxed to its full capacity. (620.)

Mr. ALLEN states that there are schools at all the Utah mining camps, and that the miners' children attend. (576.)

Mr. ROSS thinks that the public-school facilities of Illinois are about as satisfactory as anywhere else, although there has been some overcrowding in Chicago. (188.)

Mr. STEPHENSON says that in most districts of West Virginia the school year lasts only 5 months, which is insufficient. In some instances coal companies unduly influence the appointment of teachers. Public night schools should be established. (26, 29.)

Mr. MITCHELL says that in the North Central States facilities are sufficient, but not in the South, in West Virginia, and west of Iowa, the standard being lower. Night schools for adults should be established. (53.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that the children of the Hungarian and Italian miners employed by his company generally go to school, and those that work by day attend the night schools that are provided for the purpose. (657.)

Mr. DAVIS says that in some mining communities the schools are fairly satisfactory, but in others, especially in the South, the school term does not exceed 6 months in the year. The witness believes that no boy or girl should be employed until graduated from a common high school. (134, 135.)

3. *Libraries.*—Mr. SULLIVAN states that many of the larger mining towns of Colorado have school libraries. There are very few public libraries in mining towns. There are a few reading rooms, but not many. The educational opportunities for the young men and women are fair, if they can afford to go to school. (356.)

Mr. TERHUNE does not know of any library in the Utah mining camps. He considers that the lack of mail facilities is one of the great reasons for the scarcity of reading matter there. (596.)

Mr. CALLIS, county attorney of Summit County, Utah, says that there is a library at Park City, but no other town in the county possesses one to which the miners have access. (631.)

Mr. VEITH, a mining superintendent of the Reading Coal and Iron Company, says that his company does not provide libraries or reading rooms for its employees, but the men provide them for themselves. There are very few, even of the foreign miners, that can not read and write. (658.)

E. Foreign capital—Laws restricting investment.—Mr. ALLEN says that the law restricting the investment of foreign capital in the Territories may be of questionable advantage, but he is inclined to believe that it is better not to have English or French or Dutch capital drawing away the profits of American industry. (572.)

F. Irrigation—Distribution of water.—Mr. HAMMOND, secretary of state, of Utah, says that the early Territorial laws of Utah provided for the formation of irrigation districts, and the later laws provide for irrigation corporations. On each irrigation system there is a water master, who allots the water to the different persons who are entitled to use it, fixing the amount they can take, when they shall take it, and how long they can use it. This rotation of water supply is a custom, probably enforced under the general powers of the corporation or the district. It works satisfactorily. (619.)

G. Political action of corporations.—Mr. BEAMAN, secretary of the Colorado Fuel and Iron Company, denies that corporations have tried to procure any legislation antagonistic to labor, or that they commonly interfere in legislative matters. Their main efforts have been to prevent hostile legislation advocated by demagogues for hold-up purposes. For every law passed within the last 20 years beneficial to corporations alone two or more have been passed beneficial, or intended to be, to labor only. (286.)

H. Patents for invention.—Mr. TERHUNE believes that genius ought to receive the highest possible rewards, and that the patent system is a great stimulus of progress. It is true that love of science is also a great stimulus to advance, and that the inventor does not generally get the material benefit of his invention. He would think it desirable to shorten the terms of patents. (605.)

I. Taxation of franchises.—Mr. HILL holds that everything that can fairly be called valuable property should be taxed, including franchises. If a company is not earning anything above its expenses and the interest on the cost of construction, its franchises can not be said to have any value; but if its franchise has an actual value, it should be taxed. (388.)

INDEX OF DIGEST.

Accidents (see also <i>Employers' liability</i>):	Pa e.
Coal mines	CXLIV
Compulsory insurance against, Western mines.....	XV, LXXIX
Agreements of employers and employees:	
Advantages of system	XXX, CXXXIV
Arbitration of disputes under	CXXXVII
Bituminous coal fields, system described	CXXXIV, CXL
Enforcement of	CXXXVII
Extension of system to other States	CXL
Hours of labor under system	CXXX
Illinois coal mines, contents of	CXXXVIII
American Smelting and Refining Company:	
Closing of plants by	XLV
Labor, relations to	XLV, LVIII-LX
Organization, capitalization, effect on prices, etc	VI-VII, XLIII-XLV
Strike against	LVIII, LX
Anthracite, overproduction, tendency toward	CXIX
Anthracite coal mines:	
Company stores	XXVIII, CXXVII
Company tenements	XXVIII, CXXIX
Competition with bituminous coal	CI
Contract mining, practice described	CXXII
Docking of coal before payment of wages	XXVI, CXX
Employment, amount of	CXIX
Exhaustion of supply, tendency toward	XXII, CXVI
Freight rates, alleged excessive	XXII, CXI, CXIV
Hours of labor	XXIX, CXXXI
Independent operators, attitude toward labor	CXV
Relation to railroads, etc	XXIII, CXIII-CXV
Labor organizations in	XXIV, CXLI
Lattimer strike, 1897	CXXXII
Machinery little employed in producing	CXVII
Powder, charges for	XXVIII, CXXVIII
Prices, range of	CXVI
Railroads—	
Coal lands, ownership of	CX, CXIII, CXIV
Combination of, alleged	CXIII-CXV
Tonnage, allotment and restriction of, by	CXIX
Safety and sanitation	CXLIH, CXLV
Social condition of miners	CXXXI
Strikes in	XXXII, CXXXIII
Wages of miners, rates of	CXXIV-CXXVI
Sliding scale system	XXVI, CXXV
Arbitration:	
Discussed generally	CLV-CLVIII
Bituminous mines, under agreement system, described	CXXXVII
Compulsory, discussed	XXXII, CLVII
State boards	CLVI
Arrests, Coeur d'Alene riot, 1899	XIX-XX, XCIII-XCVIII
Bituminous coal mines:	
Check weighmen	CXXII
Coal lands, ownership of, Illinois	CX
Colorado, conditions of capital in	XLVI
Colorado Fuel and Iron Company, business of	XLVI
Combinations in production	XLVI, CXII

CLXX INDUSTRIAL COMMISSION:—THE MINING INDUSTRIES.

Closing of plants by, smelter combination	XLV
Colorado Fuel and Iron Company	VII, XLVI
Copper, limitation of output by	XLII
Precious metal mines, effects on	XLI
Prices, effect on—	
Oil	VIII, XLVIII
Smelters	VI, XLIV
Standard Oil Company, Western oil fields	VII, VIII, XLVII-XLIX
Strikes, effect in strengthening employers	XLV
Company boarding houses:	
Complaint regarding, Bunker Hill and Sullivan mine	LXXXVI
Western States—	
Conditions in	XIII, LXXI
Maintenance by mine operators	LXXI
Company hospitals, Western mines, conditions in	XIII-XIV, LXXI
Company stores:	
Discussion of practice of maintaining	CXXVI
Eastern mines	XXVII-XXVIII, CXXVI-CXXVIII
Laws regarding, unconstitutionality	CXXVIII
Prices and compulsion to patronize	CXXVI
Western mines, conditions in	XII-XIII, LXVIII
Company tenements:	
Eastern coal mines, conditions in	XXVII-XXVIII, CXXVII-CXXX
Western mines, conditions in	XIII, LXX
Conciliation in labor disputes, discussed generally	XXXII, CLV-CLVIII
Continental Oil Company, effect on competitors	VIII
Contract labor, importation of, Western mines	LXXX
Contract system, anthracite mining	XXVI
Convict labor, regulation of, discussed	XXXIV, CXLVI
Cooperation:	
Instances of practice	CLVIII
Policy discussed	XXXV, CLIX

CLXXII INDUSTRIAL COMMISSION:—THE MINING INDUSTRIES.

	Page.
Copper, limitation of output.....	XLII
Coroner's jury, verdict regarding Coeur d'Alene riot, 1899.....	XCI
Corporations:	
Overcapitalization.....	CLXIII
Politics, influence on.....	CLXVII
Cost of living, miners.....	XV-XVI, XXXV, LXI-LXIII
County commissioners, removal of, Shoshone County, Idaho.....	XVIII-XIX, CV-CIX
Delaware, Lackawanna and Western Railroad:	
Anthracite coal business.....	CX
Wages paid to coal miners.....	CXXV
Discriminations, freight. (See <i>Freight rates</i> .)	
Docking, practice discussed.....	XII, XXVI, LXVII, CXX
Drunkenness, coal mines, conditions in.....	CLIX
Eastern States, condition of capital in.....	XXII-XXIV
Education, advantages and conditions of.....	CLXV
Eight-hour day. (See <i>Hours of labor</i> .)	
Employers:	
Relations with employees.....	XXX, LX
Strikes, instigation by.....	LVII
Employers' liability:	
Extension of, desirability.....	XV, LXXX
Legislation regarding, discussed.....	XXXV, CLVIII
Employment:	
Amount, duration of—	
Eastern coal mines.....	CXVIII
Western mines.....	XI, LXI
Machinery, effect on.....	CLIX
Strikes, effect on average number of days.....	CLIII
Farmers, Utah, work in mines.....	LXXXIII
Foreign born:	
Effect of competition on American labor.....	CXLVIII
Employment and conditions in coal mines.....	XXIX, CXLVII
School attendance.....	CLXVI
Western mines and smelters.....	XVI, LXXX
Foreign markets, coal, opportunities for.....	CXVI
France, Hugh, action in connection with Coeur d'Alene riot, 1899.....	XCVIII
Franchises, taxation.....	CLXVII
Freight rates:	
Anthracite coal, alleged excessive.....	XXII, CXI, CXIV
Discriminations—	
Desirability of suppressing.....	CLXIV
Mining products, Western States.....	XLIX-LI
Discriminations between individuals—	
Bituminous coal mines.....	XXIII, CXII
Standard Oil Company.....	VIII, XLIX
Discrimination between places—	
Bituminous coal fields.....	CXI
Western States.....	L
Gold. (See <i>Precious metal mining</i> .)	
Government ownership:	
Industries, generally discussed.....	CLXV
Railroads and telegraphs.....	CLXIV
Guggenheim smelters, capitalization and relation to smelter combination.....	XLIV
Hanauer Smelting Works, wages paid by.....	LXIV
Homes, ownership of, Western mines.....	LXXXIV
Hours of labor:	
Bituminous miners, Illinois.....	CXXXIX
Coal mines, Eastern States.....	XXVIII, CXXX
Eight-hour system—	
Advantages.....	CXXX
Colorado, smelters' strike caused by law regarding.....	LVIII, LIX
Colorado and Utah, law discussed.....	XIV, LXXII-LXXVI
Reduction—	
Advantages discussed.....	XXXIV, LXXII, LXXVI
Effect on output.....	LXXII-LXXVI
Policy discussed.....	CLVIII
Sunday labor, Western mines.....	XV, LXXVI
Western mines, conditions in.....	

Housing of employees. (See <i>Company boarding houses; Company tenements.</i>)	Page.

TESTIMONY.

INDUSTRIAL COMMISSION.

THE MINING INDUSTRIES.

TOPICAL PLAN OF INQUIRY OF SUBCOMMISSION ON MINING.

[The term "mining," as used in this topical plan of inquiry, includes coal, iron, petroleum, precious metals, and all other mineral products.]

PART I.—AS TO LABOR EMPLOYED.

I. COMBINATIONS OF LABOR.

1. Constitutions and regulations of the several trades unions; funds and benefit features.
2. Growth of trades unionism; proportion of total employees embraced in membership; in the several industries and the several States; allied trades.
3. Incorporation of trades unions; feasibility and legal effect.
4. Relations to nonunion labor and the right to liberty of contract.
5. Unskilled labor, organized or unorganized.

II. STRIKES, ARBITRATION, AND CONTRACT LABOR.

6. Enumeration of the several causes leading up to strikes.
7. Economic results of strikes and lockouts; to workers; to employers; to the community at large.
8. Methods of strikes; the "boycott;" the black list; picketing or patrolling; other methods of influencing results, whether by employers or employees; sympathetic strikes.
9. The importation of new or foreign labor under contract, or otherwise; operation of the law forbidding the importation of contract labor.
10. Conciliation, mediation, and arbitration; under State law; by joint committees, temporary or permanent.
11. Compulsory arbitration.
12. The injunction in strikes.

III. WAGES AND METHODS OF PAYMENT.

13. Weekly, semimonthly, and monthly payment laws; advantages and disadvantages.
14. Time work; piecework; overtime work; task work.
15. Sliding wage scales, operation of; minimum wage scale.
16. "The living wage;" the standard of living.
17. Store orders, and payment in kind.
18. Fines and penalties.
19. Mine tenements.
20. Differences in wage schedules in different States and sections.
21. Relative rates of wages during the past fifty years.
22. Relative social condition of labor during the past fifty years.
23. Influence of organized labor on wages.

IV. EMPLOYMENT.

24. Increase or decrease in number employed; excess of employees; the unemployed.
25. Effects of employment of children on themselves; on adult labor.

IV. EMPLOYMENT—Continued.

26. Causes of irregularity of employment; rules and regulations; general conditions.
27. Average number of days employed during the year.
28. Hours of labor in the several States; Sunday labor.
29. The shorter workday; its effects where adopted; economic and social arguments for and against.
30. Operation of existing laws as to screens, company stores, etc.

V. COOPERATION, PREMIUM PAYMENTS, PROFIT SHARING, INDUSTRIAL COPARTNERSHIP, ETC.

31. Practicability and present status of these methods.
32. Other plans for improving the condition of workingmen; old age and service pensions; sick insurance; accident insurance; industrial insurance.

VI. IMMIGRATION AND EDUCATION.

33. Effects of immigration on employment of skilled and unskilled labor; on wages; on morale.
34. Suggestions for the regulation of immigration.
35. Colored labor; non-English-speaking labor.
36. School age of children in the several States.
37. Sufficiency of public-school facilities in the several States and Territories.
38. Suitability of public-school instruction to needs of working people.
39. Trade schools; manual training; technical education.
40. Public libraries; reading rooms; lyceums.

VII. CONVICT LABOR.

41. Effects of convict labor in mining on free labor in the several States and Territories.
42. Suggestions for its noncompetitive employment.

PART II.—AS TO CAPITAL EMPLOYED.

I. COMPARATIVE EARNINGS OF CAPITAL INVESTED IN MINING.

43. During the past fifty years.
44. As compared with other lines of investment: Banking, real estate, railroading, mercantile business, etc.
45. Effects of restrictive and other industrial legislation on the capital employed in mining in the several States and Territories.
46. Proportion of labor and capital in the industrial product.
47. Taxation: Character, extent, and effects of, in the different States and Territories.
48. Suggestions for the modification and unification of tax methods, State and local.
49. Discriminations in freight rates; effects of, on capital, on labor, and on localities.
50. The closing of mines in localities; causes, natural and artificial.

II. THE PRESENT CONDITIONS OF MINING.

51. Concentration and consolidation: Its effects on prices and profits; on wages and employment; on smaller enterprises; on business competition; on production.
52. The legal regulation of trusts and other forms of monopoly; operation of existing antitrust laws; suggestions for modification or extension.
53. Combinations; causes inducing them; objects sought by them; results secured; rules, regulations, and constitutions; manner and extent of enforcing authority.

III. PRODUCING CAPACITY OF MODERN MACHINERY.

54. Present machinery, its effects on prices; on profits; on labor.
55. Capacity of the several mining industries in relation to consumption and existing markets.
56. Productive capacity of latest mining machinery, as compared with machinery ten and twenty years ago; effect on cost of output and on overproduction.
57. Overproduction and underconsumption; causes and remedies.
58. The extension of foreign markets; possibilities and methods.
59. Cost of production during the past fifty years.

PART III.—INDUSTRIAL AND REMEDIAL LEGISLATION.

60. Employers' liability laws.
61. Sanitary and personal-safety laws.
62. Mine-inspection laws.

63. Check weighman laws.
64. Laws regulating employment of children.
65. School laws in the several States and Territories.
66. Laws regulating payments, penalties, screens, company stores, etc.
67. Laws regulating mediation and arbitration.
68. Convict-labor laws.
69. Uniformity of mining legislation in the several States and Territories.
70. Suggestions for remedial legislation.
71. National legislation.
72. State legislation.

WASHINGTON, April 10, 1899.

TESTIMONY OF MR. NEIL ROBINSON,

Coal-mine operator, Charleston, W. Va.

The Industrial Commission met at 10.30 a. m., Vice-Chairman Phillips presiding. Mr. Neil Robinson, mine operator, of Charleston, W. Va., whose place of business is Coalburg, W. Va., testified. The topical plan of inquiry on mining was followed.

Q. (By Mr. RATCHFORD.) How long have you been engaged in the mining of coal?—A. It lacks but a few months of a quarter of a century—twenty-five years next September.

Q. Have your operations during that time been confined to the State of West Virginia?—A. Yes.

Q. What is the character of the coal you have been mining during that time?—A. Two grades, one of which is known as splint or domestic coal and the other a soft coal for steam purposes.

Q. What are the principal markets which your coal enters?—A. The principal market has been in the West, although our shipments have been considerable to the East, the Virginias, some to the Carolinas, New York, and New England ports. Perhaps two-thirds has gone west, to Cincinnati and central Kentucky.

Q. Do you ship a good deal by river?—A. Yes.

Q. Does it go into the Southern markets?—A. Not beyond Cincinnati.

Q. Please reply to questions under Part II of inquiry: "Comparative earnings of capital invested in mining."—A. The proposition is rather a difficult one to answer with any degree of satisfaction. I looked at the question before coming on; to answer it properly would involve a strict and careful comparison, so far as my own information would go, with the various lines of industry that are represented in question 44. Generally speaking, the mining industry in the section with which I am most familiar has not been so successful from a money-making standpoint as banking, real estate, or the mercantile business.

Q. Has the percentage of failures been greater in the business in which you are engaged than in the other classes of business referred to?—A. Yes; for with a few exceptions there has not been a mine in the Kanawha district that has not passed through two or three and sometimes four hands, as the result of failures. The New River district has been more fortunate in that respect. In justice to the industry, I think it is no more than right and proper to say that quite a large percentage of the failures in the field may be attributed to ignorance or want of experience on the part of those in charge. There are, of course, a great many vicissitudes in the coal-mining business, in opportunities to work, in water in the river, shortage of cars, accidents, etc. Many of the mines have been started by men from other fields of labor, and who were not prepared to make proper allowances for the unknown.

Q. Have failures in the coal-mining business been brought about by producers in West Virginia endeavoring to extend their markets to competing fields?—A. I do not think any failures have resulted by reason of the efforts to extend trade.

Q. Is it a fact that the State of West Virginia has increased its production during the past six years more rapidly than any other coal-producing State of the Union?—A. That is my recollection of the figures. I think our tonnage last year was something over 14,000,000—that is, for the State as a whole—making the State the third coal-producing State in the Union.

Q. "Effects of restrictive and other industrial legislation on the capital employed in mining in the several States and Territories."—A. In our own State,

at the present time, the restrictive laws are rather limited. I believe that several laws that were on the statute book, when tested before the courts, have been decided to be unconstitutional. One statute that came before the court of appeals received the vote of two judges as being constitutional, and two as unconstitutional, leaving undisturbed a decision by a judge in one county against the law and the decision of the judge in the adjoining county in support of the law. So far as West Virginia is concerned, restrictive laws are limited.

Q. To what do you refer?—A. To the screen law, I believe.

Q. "Discrimination in freight rates; effects of, on capital, on labor, and on localities."—A. The operators, almost without exception, are opposed to discrimination in freight rates; they want an open rate, a fair field, and no favor. Whenever there has been discrimination, as a rule it has resulted in an injury to the district. Discrimination has been made to enable one mine operator to put his coal in the market at a less rate than another. The sufferer will struggle along and endeavor to meet competition, perhaps by retrenchment in wages, or be compelled to stand a shortage in work. If the conditions are known, as they should be, then a man going into business can estimate in advance just what he can do; figure the cost of his coal, and know whether he can afford to go into the business or not. It is no more than right and just that freight rates should be uniform.

Q. Has this discrimination been practiced in your State to any extent?—A. The testimony of Mr. Ingalls, before the Interstate Commerce Commission some months ago, was very clear to the effect that there had been discrimination up to that time, but Mr. Ingalls stated on the stand that there would be no further discrimination and we have no reason to believe he has violated his promise since.

Q. (By Mr. C. J. HARRIS.) Do any railroads own coal mines of their own?—A. The Chesapeake and Ohio does not; none of the roads I am familiar with own mining property.

Q. Do some of the railroad men own coal mines?—A. I only know from hearsay; I know Mr. Elkins is president of a railroad, and at the same time is president of some companies that are interested in mining; but that is in an entirely different district from ours, and one I know of incidentally only.

Q. Was there a complaint among the coal miners along these roads of being unable to compete with those mines owned by the parties who owned railroads?—A. That I do not know, because they are a long distance away from us.

Q. (By Mr. SMYTH.) Are they competitors with you in the market?—A. Not directly.

Q. (By Mr. C. J. HARRIS.) Where do you ship your product?—A. Most of it goes to the West.

Q. (By Mr. RATCHFORD.) Have you any knowledge of discrimination being practiced by any railroad?—A. None whatever; neither directly nor indirectly.

Q. (By Mr. SMYTH.) Is there discrimination with reference to the supply of freight cars?—A. None whatever, to my knowledge.

Q. Are the facilities the same to all points?—A. The cars are distributed equitably, so far as we can tell.

Q. Have you but one road at your mines, or have you competition?—A. We have competition by water. Nearly all the mines in the Kanawha district have loading "tipples" on the Great Kanawha River, which has been improved by the Government with a system of locks and dams. We have, perhaps, an average of 6 feet of water the year round.

Q. Are your rates based on water competition?—A. Necessarily.

Q. Does that apply only to the West?—A. Yes.

Q. (By Mr. RATCHFORD.) Have you any knowledge of any railroads in your State encouraging operators to open mines, perhaps, on their line of railroads, and agreeing with such mine operators to handle their product at a certain price?—A. No. I have heard suggestions and surmises of a character similar to that from time to time, but whether there is any truth in them is a matter known only to those parties most interested, but there is nothing of that kind to my knowledge.

Q. Do you think the best results would accrue to all interested and to the public generally by having railroad companies advertise their freight rates, and charge their advertised rate in all cases, measured by the distance which the freight is hauled?—A. I am not prepared to say it should be measured by the distance hauled. There should be an open rate, adjusted for competitive districts, but it would be hardly fair and proper to place it on a mileage basis.

Q. Will you state why?—A. For instance, from some States a railroad may be handicapped by perhaps an extra fifty or one hundred miles of a haul to a market. It has been the experience of most roads, where they have a long haul, that the

matter of forty or fifty miles does not make much difference; the percentage is so small that it makes very little difference; and if they choose to go in and handle the tonnage at a little less profit than another road, there is no reason why it should not be done. The public would be benefited by having two or three roads carrying into the same field. You make a mileage basis and every extra mile of distance is a handicap, and competition, of course, is checked.

Q. Would the cost of transportation in the case of a long haul be a little additional?—A. Undoubtedly.

Q. Do you believe you ought to pay that additional?—A. I do not.

Q. Do you believe the product of an operator ought to be handled and shipped for the same price, even though he is fifty miles farther from the market?—A. It is a railroad proposition, of course, and it is optional with them whether they choose to haul coal 500 miles for the same rate paid another railroad for hauling 450 miles. Then the mere matter of mileage does not always express the true condition. The grades to be overcome and the number of tons that can be handled by each train are to be considered as well as mileage.

Q. Do you believe that a shipper who is 50 or 60 miles farther from the market than his competitor should have his product shipped at the same flat price?—A. Except for local trade, where distances are short, I think that the rate should be the same from competing districts. I take it the commission wants to look at the matter in the broader term. For instance, take the Chicago market; there are a number of roads now carrying coal from east of the Ohio River—the Pennsylvania system, Baltimore and Ohio, the Chesapeake and Ohio, the Norfolk and Western and its connections. If you adopt a mileage basis straight through, the coal will come into Chicago from the road that has the shortest haul.

Q. Does that system encourage the shipment of coal into other than their natural markets?—A. No; I think not. It is, of course, optional with the railroad whether they choose to name a rate for a given point to meet a competitive rate. It is not a mining proposition at all.

Q. "The closing of mines in localities; causes, natural and artificial."—A. I do not know any mines that have been closed for artificial reasons; by artificial, I assume you mean mines that have been closed by "dead renting." The only mines in the Kanawha and New River districts that have been closed within my recollection have been closed by reason of the inherent defects in the mines proper, or exhaustion.

Q. Division II, "The present conditions of mining." "Concentration and consolidation: Its effects on prices and profits; on wages and employment; on smaller enterprises; on business competition; on production." What can you state to the commission under that topic?—A. So far as I understand it, concentration and consolidation have been brought about in numerous instances for the purpose of reducing the expenses, and also the marketing expenses; in other words, to place business on a footing where it would not be necessary to have two men to do one man's work.

Q. Do you think its chief object is its effects on prices and profits?—A. Its effects on profits should be marked, of course, because wherever you can reduce supervision expenses there is a gain. The labor affected most in these consolidations has been that of the operators themselves, their bookkeepers, storekeepers, and, as a rule, officials.

Q. What are its effect on wages and employment?—A. I think that the effect on wages and employment would really be a betterment.

Q. You are speaking of the general run of employees?—A. There is no disposition on the part of the operators to reduce the wages of their employees; they would rather pay them more than less if it could be done, and within my own recollection of 25 years I do not know of a single instance when labor has been reduced in wage as a measure of profit; it has been reduced as a measure of necessity. There have been competitive conditions at times that have forced mines to economize and cut down the initial cost of their product and they have had to call upon their men to help them; but in each instance the condition of the markets has been well known to the men, and I think in almost every instance when a difficulty of that kind has arisen the men have realized and acceded to the necessity of the call.

Q. (By Mr. SMYTH.) Do you think consolidation has tended to make employment more regular?—A. I think it will make it more regular.

Q. (By Mr. RATCHFORD.) Where operators find it necessary to reduce wages from necessity, are their profits reduced proportionately?—A. Yes.

Q. Are you familiar with the history of the late national strike among miners?—A. Only to a partial extent.

Q. Are you familiar with the causes that led to that strike?—A. Probably not as well as yourself.

Q. Were the reductions in wages that led to that strike a necessity?—A. I do not believe I ever fully understood that strike. I looked upon it at the time more as the result of a general demoralization of the markets; prices had been going down for a number of years; there had been more or less interruption to work, and as a general proposition, when men are thrown out of employment, when they are idle, they naturally become restless and seek for a cause to counteract their troubles, and it generally results in a strike.

Q. Are you familiar with the prices that ruled in many of the competing districts before and at the close of the strike?—A. Not to the extent of being a valuable witness, from the fact that our sales are all f. o. b. cars at the mines, and for a long time there were certain conditions in regard to transportation rates known to exist that made market rates rather an uncertain question. I never felt I had exact information as to what coals were netting in Chicago or in distant markets at all.

Q. Is it true that when the wages of the workingman are the highest the operators are making the greatest profits?—A. It has been my experience that at the times when we paid the most wages we have had the best results, but what might be called an exceptional high wage as a rule has been limited to periods of ice in the river or the enhancement of coal values by some unusual causes.

Q. (By Mr. C. J. HARRIS.) Can you pay for shipping to Chicago and compete with coals that are mined much nearer and with much less freight rate?—A. Yes; to some extent.

Q. Would you have to produce your coals for less than operators nearer the market?—A. There is quite a difference in the coals, and quite a difference in their actual value for fuel purposes.

Q. Unless your coals were better could you compete with any near-by mines?—A. We could not compete at all. There are coals coming from other States that will perform work that these Illinois coals will not perform.

Q. The wages you pay must be regulated to a certain extent by your competition?—A. Naturally.

Q. Why do you say the best results and greatest profits are made while you are paying the highest prices to miners?—A. I explained that in saying that exceptionally high prices were the result of exceptional conditions.

Q. (By Mr. RATCHFORD.) Did coal operators receive better returns for their capital fifteen or twenty years ago, at the higher mining price, than since that time?—A. My recollection is that the mining rates during the last ten or fifteen years have not been changed very materially in our district. The price has varied, of course, but I think that there is only about one-fourth of a cent variation between the present price and the prices of 1882, 1883, and 1884. Without referring to my labor list, I would not undertake to be at all certain about it. I have no data with me. I have not looked it up for a long time.

Q. What are the effects of such consolidation on smaller enterprises, on business competition, on production?—A. In our district the effect of the consolidation which was made some time ago is in the interest of the smaller enterprises. Our consolidation, and the only one with which I am at all familiar, was simply one for marketing the coal—handling it through one common agency—and in the plan as adopted, each mine making an application to the association for membership was allowed to come in and share orders and cars pro rata without any discrimination whatever. The smaller mines under ordinary circumstances would be crowded out in the general struggle. As it is in the Chesapeake and Ohio Coal Association, the smallest shipper has an equal voice with the heaviest, and if he has a capacity for 4 cars a day and his neighbor has a capacity for 20, and 12 cars come into the district, he gets 2 cars, while his big competitor gets 10; it is founded on absolutely fair and just lines. There has been no suggestion as to restriction in production. We find as a general proposition that we are restricted by reason of ice in the river, low water, high water, or scarcity of cars, without restricting output by regulation.

Q. (By Mr. SMYTH.) Can you tell us the amount of capital invested in the coal-mining industry in West Virginia?—A. I can not; in the Kanawha district, I presume about a million and a half. That does not include land that is held and undeveloped—in the New River district about three and a half millions in active properties.

Q. Have companies much capitalization?—A. No; with two or three exceptions. There is one company that has a capitalization of \$450,000, and another \$500,000, or something like that.

Q. Have they different classes of this stock; common, or preferred, or any bonds?—A. Not as a rule; most of the companies in Kanawha and New River districts are operated by resident owners. I think there are perhaps three or four

mines that have what might be called nonresident ownership. One of the mines is owned in Philadelphia; another mine is owned very largely in England; another in New York, and another in Pennsylvania; but there are seventy or eighty mines there, and those are about the only exceptions that occur to me at the present time.

Q. Are they generally owned by corporations or by individuals?—A. Both.

Q. Do you think there is any overcapitalization—watered stock?—A. I have never known of any stock being on the market at all. Where companies have been organized, it has generally been where two or three partners in the business have organized in order to get the stock in such shape that, in the event of the death of one person, it would not affect the survivors.

Q. (By Mr. NORTH.) Has much capital been lost in mining?—A. The losses have been quite heavy, running over quite a period of years.

Q. What causes induce coal combinations and what object is sought by them?—A. I would have to deal, of course, with the only association with which I am at all familiar. We have found that there are in the Kanawha district quite a large number of mines, and they have been buffeted about by the buyers, some one mine being used against another to cut the rates and reduce the values constantly. At the same time each mine was employing an agent in the field, and if the operator himself was not reckless, in all probability his agent would be. They are pretty hard to hold down. They tell them to sell their product at certain prices, and the first thing you know they have cut it, and the agent of another man comes and makes a further reduction. A mine was at the expense of sending men to Cincinnati, Chicago, to central Kentucky, and to the East seeking for trade, and as a matter of course that mine was under very heavy expense. With the trade scattered from Old Virginia and Carolina in the East to Chicago and the West, it was simply impossible for any single man to keep thoroughly posted. You would think you had a good customer, and find out he was not; so that the losses in that direction meant quite a good deal. To reduce all these useless expenses we organized the Chesapeake and Ohio Coal Association, employed an agent to sell our product in the Western markets, giving him the control of the coal that went west of the mines, except such as was carried by water, and this agent brought enough capital into the business to insure prompt payment on the 20th or 23d of each month to the various companies for all of the shipments of the preceding month.

Q. (By Mr. PHILLIPS.) Does he furnish that capital, or is it furnished by your association?—A. He furnishes the capital from his own resources.

Q. (By Mr. SMYTH.) Does your association regulate the rate of wages?—A. Not at all; because our association consists of the agreement between the operators and what is known as the C. & O. Fuel Company, and the association has reference solely and entirely to the marketing of the product, and wages and wage questions do not enter into it, either directly or indirectly, in any way, shape, or form.

Q. Are those matters decided by each individual?—A. Yes.

Q. (By Mr. RATCHFORD.) Is the association you have referred to purely a selling agency?—A. Yes.

Q. (By Mr. NORTH.) How much have you been able to save in your selling expenses as a result of this combination?—A. The sales agency handled from our mines last year about 600,000 tons, and I think it is safe to say that there was a resulting saving of from 2 to 3 cents a ton. That is purely an estimate offhand, without going into details, which would be a difficult matter to do, of course.

Q. (By Mr. RATCHFORD.) Will you supply this commission with a copy of the rules of that association?—A. Yes. There would be no authority to enforce. It would be a matter of agreement and contract as between the fuel company, the selling agency, and the men. In case of a breach of contract their recourse would be a suit in equity.

Q. (By Mr. NORTH.) Have you had such a suit?—A. No.

Q. (By Mr. C. J. HARRIS.) Is there any machinery used in your district?—A. Yes; quite a good deal.

Q. (By Mr. RATCHFORD.) What proportion of the coal of your district is mined by machinery?—A. I called at the chief mine inspector's office a few days ago to look that question up. I called three or four times, but found he was out of his office, and I was unable to obtain it. It is given in the chief mine inspector's official reports from the various mines.

Q. (By Mr. SMYTH.) Do you think it is mined cheaper by machinery than hand labor?—A. I think there is some economy in it, though not as great as the gentlemen who are selling the electrical machines probably would lead an operator to believe. There is one advantage in the introduction of machinery that I think

has more to do with its use than almost anything else, and that is a little better ability to control production. It very often happens if you engage a man for a day's work that he will go in and do that day's work faithfully and well, being paid by the day; but if you put that same man out to do a certain amount of work for himself, by the ton or by the bushel, as the case may be, he may get a little bit tired in the middle of the day and will drop out and stay away when he would not give up a regular position; and very often when you have a lot of cars on your track and a lot of orders you want filled the men may be out, when mining by the ton or bushel, and you can not get your output, whereas with machinery you generally can get enough men in to insure something like a production.

Q. (By Mr. RATCHFORD.) Do you believe that is an argument in favor of machinery?—A. It would be with me.

Q. Is the commission to understand from that that all the machine-mined coal is mined on a day-wage basis?—A. Not necessarily. Both rates are in vogue—with some it is per ton and with others per day.

Q. (By Mr. C. J. HARRIS.) What is the rate of wages in your section by the day?—A. It varies. I think it runs from about \$1.50 to \$1.81. Some classes of labor are paid \$1.25, but most of it runs higher than that.

Q. (By Mr. RATCHFORD.) What is the class to which the higher wages are paid?—A. The cutters get more than that; I think their wages are about \$2. But all that pertains to machinery can best be secured from someone who is engaged in that work.

Q. Capacity of the several mining industries in relation to consumption and existing markets?—A. I am inclined to believe that the mines that are now opened and developed have a capacity that is in excess of the annual consumption.

Q. How much in excess?—A. I would be almost afraid to venture to make an estimate on that. I should say, though, that it would run from 25 to 30 per cent.

Q. Are there authentic statistics on this matter?—A. I think so. I think some of the Government publications show it.

Q. According to your belief, is it 25 per cent?—A. I mean if all the mines that are opened and developed were kept in steady operation there would be an oversupply of coal on the markets.

Q. Are you speaking for the country at large?—A. For the United States. One corrective feature of that is going to be the exportation of coal, and I think it is only a question of a year or two until we will find our export trade is keeping pace with that of England.

Q. (By Mr. PHILLIPS.) To what countries chiefly is it exported?—A. Our exportations have been rather limited, but for perhaps 2 years now one American firm has had a salaried agent in Rio Janeiro, who has traveled along the Brazilian coast. The Commercial Museum of Philadelphia have had a number of interesting reports which they have obtained from correspondents and consuls in the Mediterranean ports; and I was noticing a short time ago that at Genoa there was less than a shilling difference between the delivery price of the Welsh and the coals from America. It is a field that has not been developed to any extent. Our people as a rule have limited themselves to their own home markets. Our coals are all high grade and will stand transportation.

Q. Is it chiefly soft coal that is exported?—A. Yes.

Q. (By Mr. SMYTH.) Are you hopeful then of that outlet?—A. Yes; feel very sure of it. You see we have coal here that can cross the equator without any danger whatever of spontaneous combustion, and they are coals that can be utilized for a variety of purposes when you get them to market—good for smithing and domestic use, and as a rule leave few ashes; and although you are buying coal three or four thousand miles away, 98 per cent of your purchase in weight is of value.

Q. (By Mr. NORTH.) At what point in Canada do your coals meet the Nova Scotia coals on a price level?—A. I am not at all familiar with that.

Q. There is some point, is there not?—A. Naturally there would be. Of course their outlet from the Nova Scotia fields is rather limited. My recollection is that there is only one line of railway leading from those fields across the peninsula.

Q. (By Mr. RATCHFORD.) How and to what extent is overproduction regulated?—A. The overproduction at the present time is not really regulated any more than the planting of wheat and cotton. In the coal mine it is just the same as it is in the cotton fields, sugar plantations, and wheat fields. Every farmer uses his own judgment about it, and goes to work and plants as he sees proper, and, as we all know, there are seasons when there is an excessive crop of hay, grain, wheat, and cotton, and the same rule applies to coal. In times of manufacturing depression of course there is a marked falling off in the consumption of coal.

Q. Is it true that the mines of your State are idle more than one-fourth of the time?—A. Counting it by week days I presume that it is. My recollection is that the mine inspector's report gave it as running from 197 to 229 work days average.

Q. (By Mr. PHILLIPS.) Is it a fact that there is a large amount of coal along the lines of railroads and waterways, thousands or hundreds of thousands of acres, that are not yet developed which could be operated cheaply?—A. In the State of West Virginia, and I think there are something like 16,000 square miles of territory underlaid with coal.

Q. (By Mr. NORTH.) Is it undeveloped?—A. Most of it. Of course a great deal of it disappears under water level or is practically inaccessible at the present time; but many of the streams cross the coal measures at an angle that opens up various seams. You could almost describe it as an inexhaustible supply.

Q. (By Mr. RATCHFORD.) If anyone of the competing fields works 50, 60, or 100 days more than any other competing field, is that an indication that the field working the greatest number of days has a competitive advantage over the others, and the one working the fewest number of days per year has a practical disadvantage?—A. The question is rather a broad and general one. There might be conditions existing in one district that would not exist in another in regard to the ability of the railroad company for instance to handle their product. On the line of the Chesapeake and Ohio there are times when they can handle much more coal and give the mines much more employment than they can at other seasons. I have known a number of instances where they have had quite heavy contracts to carry cotton to tide water, and the returning cotton cars would be at the disposal of the operators for west-bound loading. And there have been times when they were shipping grain and they would place the returning box cars at the disposal of the operators, and in that way they would be able to increase tonnage. In this last season there has been a shortage of cars almost continuously. For perhaps 4 or 5 months we have been losing time on account of the inability of the road to furnish us with transportation, so that the falling off of one district in reaching a competitive market might originate from a cause entirely foreign to the character of the coal or the right of the coal to get to that market.

Q. I do not refer to any particular market; I refer to the different coal fields.—A. My explanation would be applicable to almost any market, west or east.

Q. Do you believe that peculiar conditions have something to do with it?—A. I think they have almost everything to do with it.

Q. But when things are equal, or nearly so, is it a fact that the causes to which I have referred are indicative of an advantage in the field that works the greatest number of days?—A. The question almost answers itself; because a mine that can ship into a market more than competing mines naturally must have some advantage or it could not do it.

Q. What factors do you believe should be taken into account in determining the value of a ton of coal in the common market?—A. The general rule of determining a market and whether to go into it or not is based on a study of the conditions existing in that market. For instance, the town of A may have a coal field 100 miles from it, and another coal field may be 200 miles from it. The hundred-mile field has the market, or has had it heretofore. Perhaps you want to get into that market and get a share of the business. You go there and find what the market rates are; what it is paying. Then you study the character of the coals and see whether there is any difference in the actual heat-producing power of the two coals, whether your coal is worth more money at \$1.50 than the other coal is at \$1, and whether the consumer can afford to pay that extra price. Then it comes down to the question of the ability of the railway company to transport it the 200 miles at a living price, and if you can put it on board your cars at the mines at a living price and reach the market.

Q. Do you believe the earning capacity or the producing capacity of the workmen should be taken into account?—A. It is necessarily taken into account as a main factor in the initial cost of the coal on board of the cars at the mines. I have never known of labor being asked to cut a penny in wage in order to enable an operator to reach a distinct market or new market.

Q. (By Mr. SMYTH.) Is a larger portion of the production in your district sold for domestic or steam purposes?—A. Most of it goes for steam.

Q. Is there much variation in the demand for domestic purposes?—A. Yes; naturally.

Q. A severe winter would make a larger demand and a mild winter a less demand?—A. Yes.

Q. Of course you can not foretell what the demand will be?—A. No. It has been the custom for a great many years in a good many of the markets, particularly in the Ohio River region, to stock up during the summer season and carry

quite a heavy stock ready for the fall business. In the East for quite a long time it was the custom of some of the larger dealers in the summer time to stock up for the winter time.

Q. Then a severe winter, like the one we have had, would lead to a larger demand for coal and consequently a larger number of days for the mines to be operated?—A. Yes; the coal-mine industry, particularly among the domestic mines, is very sensitive to the mercury; it goes up and down with the thermometer.

Q. (By Mr. NORTH.) Is it true that the demand for coal for household purposes is comparatively small?—A. It is really getting smaller every year. When I first commenced shipping the block coal, it was used in every hotel. You would find open fireplaces and fires in the rooms, and nearly all the residences in the country were depending upon open grates for their heat. Of course we know there is an immense waste of heat going up the flue. Within the last 10 or 12 years there have been improved methods of combustion, and every house now of four, five, or six rooms either has a hot-water heater or steam heater or a furnace of hot air, and they burn almost anything that is black.

Q. (By Mr. SMYTH.) Has the demand for coal lessened in that way?—A. In that way the demand for high-grade domestic coal is restricted to those people who choose to burn a little in the parlor or libraries when they want something brighter than the radiator.

Q. (By Mr. PHILLIPS.) Has the use of natural gas had something to do with the consumption of coal?—A. No; except in a few localities, because natural gas has not been piped to any great distance from the fields. I believe there is some piped to Chicago, and, of course, Indianapolis, Pittsburg, and Wheeling. As a general thing natural gas for large cities is limited to those named.

Q. Is the demand for manufacturing and transportation purposes constantly increasing?—A. There is a better market, of course, for coal for furnaces and for steam than there is for domestic trade.

Q. (By Mr. NORTH.) Does the kerosene lamp and stove have any perceptible effect on the consumption of coal?—A. We know that it is having an effect. When we feel there is a shortage of orders, we can not say specifically how much of this is owing to gas and gasoline. It gets lost in the general combination. We do not know what the extent of it is.

Q. (By Mr. RATCHFORD.) Is it true that some of the devices constructed during recent years have reached that state of perfection where they consume what was hitherto considered a waste?—A. I have at Coalburg a slack pile about 1,200 feet in length, 150 feet in general width, with an average depth of about 6 feet. That was screened and thrown out back in the sixties—1864 and on. At the present time every ton of that coal would be utilized; would go into the market.

Q. Have you employers' liability laws in your State?—A. A bill was introduced in the last legislature that had some bearing upon the employers' liability, and I believe there is something on the statute books in regard to the coservant law, but I am not at all familiar with those laws. I have never looked them up.

Q. Are the sanitary and personal-safety laws effective in your State?—A. They are, to the best of my knowledge. The mine inspectors make frequent visits, and I think their orders are carried out.

Q. How about the sanitary laws in the mining villages?—A. We have nothing in the nature of a sanitary law in any of the villages. There is no regular law. Most of the villages are built upon the banks of streams, and the main trouble they always have is in getting water that is pure for drinking purposes. Naturally, if a house is kept in bad condition, the mine operator has the trouble removed and corrected.

Q. (By Mr. SMYTH.) Are the houses owned by the operators, as a rule?—A. As a general rule.

Q. Are the miners compelled to live in them?—A. Not at all. The operators are very glad, indeed, to have them own or rent elsewhere.

Q. Is there no discrimination between the man who rents a tenement from the mine and another who does not?—A. Not at all. Some years ago I was at pains to look over the labor list, and I was somewhat surprised to learn that 32 per cent of the men in my employ at that time owned their own properties, and a great many of them were men whom I had helped to get their property; in fact, I have a few claims against some of them which I would be willing to cash in at a very much reduced rate. They are for buildings I helped construct for them without getting my money back.

Q. (By Mr. RATCHFORD.) Are there any sanitation laws of your State?—A. None that I am familiar with.

Q. We find 100 or more miners employed in a mine several hundred feet under the

earth, where the air is impure. Do you not believe some sanitary measures are as necessary to the health of an individual in that case as it would be in a workshop, mill, or factory?—A. The principle is exactly the same.

Q. Have you laws in your State governing the question of check weighmen?—A. Not to my knowledge. I have never known where a check weighman has been refused when asked for.

Q. (By Mr. NORTH.) Is there no complaint on the part of the miners?—A. Not to my knowledge. Most of the mines have test weights, that they receive from the sealer of weights and measures, and test their scales from time to time.

Q. (By Mr. PHILLIPS.) Do the miners ever employ a man, to your knowledge?—A. Yes; it is frequently done.

Q. But it is not the universal rule?—A. No; it is optional with the men, so far as I know.

Q. (By Mr. RATCHFORD.) Have you laws regulating employment of children?—A. I am not at all familiar with that law; have never had occasion to look it up. We do not employ children.

Q. (By Mr. SMYTH.) Are boys employed in the mines?—A. I do not believe I have a boy in the mines under 14 or 15. I may possibly have one trap boy 14 or 15 years of age. This question possibly has reference more to Pennsylvania, where they have boys in the breakers.

Q. (By Mr. RATCHFORD.) Is it your personal opinion that boys under that age should be excluded?—A. Yes; I think an operator ought to exclude them voluntarily if they are not excluded by law.

Q. Have you laws regulating screens, company stores, etc?—A. There is one in regard to screens. There has been some question of its constitutionality.

Q. Does the law regulating the screen prescribe the size of the screen to be used, or does it abolish the screen?—A. The law abolishes the screen.

Q. You have screens in use now?—A. Yes.

Q. Will you state to the commission the character of those screens?—A. The screens vary according to the character of the coal. Some gas mines have a half-inch screen that takes out the dust; some have three-quarters, some an inch and a half, and a few of them two inches.

Q. You say they vary in size according to the character of the coal?—A. The screens vary according to differences in the character of the coal, and in one or two instances there is a variation in size of the screens in practically the same district.

Q. In each case is the size of the screen a matter wholly with the control of the employer?—A. It is a matter of agreement between the employer and employee.

Q. Have you any instances in your State in which the employees have aided in fixing the size of the screens?—A. No.

Q. That being true, it seems to me that it rests wholly with the employer. Is that true?—A. Not necessarily. Generally at the starting of a work the operator decides upon what grade of coal he wishes to produce, and he puts in his screens at an inch and a half, three-quarters, or 2 inches, as the case may be, and he starts up his work; and then he fixes his scale of wages, or pays the wage scale of the district, and it is optional with the men whether they come in and go to work under the system adopted. The use of screens is almost entirely abolished in a good many of the districts, and I have no doubt whatever that the operators would be very glad indeed to dispose of them if possible. In coals that are intended for the domestic trade careful preparation is an absolute necessity. The buyer pays a great deal of attention to the appearance, and if we were to send our coal out as it comes from the pick it would not be any time until we would practically be ruled out of the market. Our coal is rather hard and we can not go in on a competitive basis for the steam trade, and we must limit ourselves to the domestic trade, and that is particular. In mining the coal a skillful miner will undercut deep, fire his shot, and bring his coal down in good big lumps. It takes a skillful miner to do it. An ordinary miner will go in and make a little undercut and will rely on powder to do the work for him, and the result is that in shooting off the solid, either in whole or in part, the coal is very much broken up, and when it comes out it does not please the buying public, and very often results in a suspension of orders. The mines that pay for coal over the screens of course pay a larger rate per ton for that coal than they would pay if they took it as it came directly from the pick. If they took it straight from the pick they would have to be careful about inspection and have penalties to keep up the standard. I have never been able to see where worthy miners were injured in any way by these screens. It may be hard on the indifferent miner, because anyone can shoot from the solid, when it is not everyone who can mine properly.

Q. Have the miners, either in person or through representatives, ever met with the employers to determine the size of the screen to be used?—A. I do not remember that the question has come up between them.

Q. Have the employers ever refused to meet the miners to deal with that and other questions?—A. There may have been refusals at various times to meet and treat on various propositions. At the same time there have been many meetings.

Q. Have there been joint meetings of the miners and operators of your State?—A. Yes; there was a meeting of the West Virginia mine workers and a committee of the operators within the last two weeks. We agreed upon arbitration and the scale and a clause in regard to the division of any advance in the market price.

Q. (By Mr. PHILLIPS.) Is that in your district or in the State?—A. The agreement was with the State organization; the meeting was held in Charleston.

Q. Do the operators of your State prefer to treat with this organization rather than with the National Association of Mine Workers, and why?—A. I can not speak for others. I can only express my own views in that matter. I have had some experience with organization and with disorganization. When I first went into coal mining there was nothing in the nature of an organization in existence, and it seemed to be left to the will and caprice of any man in the mine to go down an entry and call a meeting at a certain time and accumulate a mob—that was the only term that would describe it. The men would come down the hill in a body and make a demand. It might be something we could not concede, and thereupon a strike would take place without a notice. There was no system of bringing the men together and having the matter discussed, and the result was that in the most unexpected way we were called upon to have stoppages. Then came the original Knights of Labor, and I believe I was one of the first operators in the district—for quite a while, perhaps, the only one—to recognize them and treat with their committees. I found the system very much more satisfactory, and I believe to-day that organization is all right. There is no objection to it whatever. In treating with an organization, however, I would rather treat with the people whose interests are identical with my own than with those whose interests are to a very considerable extent inimicable to mine. The great weight of influence and power of the national organization rests with the representatives from Ohio, Indiana, and Illinois; and West Virginia, being a young and growing field, having no large home market, must naturally come in competition with these other districts. From an operator's standpoint it would not be in our interest—and operators do care for and look out for their men—to have our men entirely at the disposal of representatives from the Pittsburgh, Ohio, and other fields. In other words, we would rather have a West Virginia organization with which we can make our contracts for work and which would make rules and regulation to govern the association, and they could make their arrangements with the other districts as it becomes necessary. In the long strike we had some few years ago, 1897 I believe it was, our men were called out on sympathy, and I think we laid idle for something like 117 days. Our men were willing to work, but orders came from the national organization, and they stayed out.

Q. (By Mr. NORTH.) Then, apart from this aspect of it, you would prefer to deal with organized labor?—A. Yes; I always have dealt with organized labor. If there is an organization and it has rules and regulations, etc., and you want to take a contract for 50,000 tons of coal, or 5,000 tons, or some other quantity, you can make an arrangement with your men and go ahead, and feel some measure of safety in doing so. If you are treating with your labor individually, you might go on to the end all right, or, the first thing you know, you might be out with a good contract.

Q. (By Mr. SMYTH.) Is your labor mostly native in West Virginia?—A. Yes; almost entirely.

Q. Have you any colored labor employed in the mines?—A. I have never had a colored man in my employ.

Q. Are they employed in the other mines?—A. In most of the other mines they are, and ordinarily the colored man who has a disposition to work and will go under ground makes a very good man and a very good citizen.

Q. (By Mr. PHILLIPS.) Are they generally organized as well as the white miners?—A. I think a large number of them are in the organization.

Q. (By Mr. RATCHFORD.) In your district are operators mining two kinds of coal, and are some screens there over 2 inches?—A. There are some 4-inch screens; that is a special preparation where there are two qualities of coal in the same seam and they put in 4-inch screens, but they have a run-of-mine basis for paying, and the separating is a matter of convenience for the operator.

Q. Is there a diamond bar or a flat bar?—A. I think most of them are flat top.

Q. What are the dimensions of the screens?—A. My bar is a flat bar; I do not know what the others are. My screens are 12 feet long by 5 feet wide on the railroad tippie and 12 feet by 4 feet 8 inches on the river tippie.

Q. Is there any difference in price in mining between a 1½-inch and a 2-inch screen?—A. No.

Q. Do they mine for the same rate?—A. Yes, but not at the same mines. Personally I would like to see a uniformity of screen.

Q. What have you to say in reference to company stores?—A. They are a help to the men. That has been the result in our district, from the fact that prices for coal have been so low for certain months of the year—sometimes for a year at a time—that the price received for the coal alone would not equal the price paid for producing it, and were it not for the revenue derived from the store business I suppose quite a number of mines would be compelled to go out of existence. The prices prevailing in the different mine stores are regulated by the competition from the adjacent stores, and if the mine did not have a store of its own the miner would buy his supplies from some of the near-by stores, where the net profit of course would go to a storekeeper from whom the mine worker would not get employment in return. With newspapers broadcast throughout the land and quotations published at every place, the prices of all commodities are pretty well known. I do not think there is any injustice in the store system at all as it is operated throughout our district. In fact, I think half the operators would have to cut wages or go out of business without this assistance.

Q. Are such stores in your district generally conducted by the mine owners?—A. Yes.

Q. Do the necessities of life sell at about the same price as in the cities and villages outside of the mining districts?—A. Counting cost and carriage, I imagine they do; I am not at all familiar with the store prices either in the cities or at the mines.

Q. (By Representative LIVINGSTON.) Have you had any protests from the labor organizations at the mines against the prices charged at your stores?—A. There have been at various times; a committee would ask if we could not make a change in the price of oil, powder, flour, or something of that sort; those things come up perhaps once a year, and sometimes may go a couple of years without any question of that sort.

Q. Are there serious discrepancies in prices?—A. No.

Q. (By Mr. RATCHFORD.) Is every miner in your employ free to deal or to refuse to deal with those stores?—A. Yes.

Q. Is the same true of other operators, to the best of your knowledge?—A. So far as I know, yes.

Q. What is the object of connecting a supply store with a coal mine?—A. The system was started rather as a matter of necessity, when the mines in the district were first opened and villages were remote, but it became customary to open up a supply store just as contractors in going out and building railroads carry their commissaries along with them. Those stores, when once started, were retained and each newcomer opening up a mine would start a store in connection with it, until it has grown to be a system, and I do not know of a mine in our State that is without a mine store.

Q. How can a coal operator, either in the State of West Virginia or out of it, who has to meet the competition in prices and who has no store in connection with his works, possibly exist when the cost of mining is greater than the price at which his coal is sold?—A. The cost of production very often fluctuates by reason of the irregularity of the work. I do not want to be captious in the matter at all in answering any of these questions; I would like to answer them just as fully and carefully as I can, but I do not want to have my meaning in any way changed. Every mine when it starts out has a certain amount of fixed expenses; the taxes run for a year; there are a certain number of employees who are under salary by the year; the investment comes in by the year, and you take your fixed charges for the year, and they may be \$1,000 or \$2,000 a month. If your fixed charges are \$1,000 a month and you only get out a thousand tons of coal, it costs you a dollar a ton. If you get out more, the fixed charges of course are reduced proportionately. Take it along in the dull seasons of the year and there will be quite a number of months, perhaps, when the mine would be showing a loss right along because of the fixed charges, and they would be unable to continue unless they had something in the way of revenue from outside.

Q. Is it a fact that those fixed charges exist with or without the store?—A. Naturally. I do not think the store question is one that is affecting the district.

Q. Can you state any reasons why men who are engaged in the production of

coal should run a store in connection with their mines that will not apply also to the men who are engaged in the production of iron or other merchandise?—A. It seems to be the disposition all over the country to multiply lines of business, grouping them under one general head. For instance, take Wanamaker's, Siegel & Cooper's, and other stores, which were dry goods stores originally, perhaps, and now sell a little of everything. I do not like the idea of having to run a store in connection with a mine; I would much rather have the thing eliminated, for it could be done if it were general; but it is not general, and as long as the conditions remain as they are now it is quite a little help to have a store, and no one is hurt by it.

Q. (By Mr. C. J. HARRIS.) If you were obliged to dispense with the company store would you either have to secure a greater price for your coal, or cut wages at times, in order to meet the competition?—A. Yes; because the margins are naturally running very close on coal.

Q. (By Mr. RATCHFORD.) Does it follow that a man who has no store when coal is sold below cost must cut the price?—A. I presume so; I do not know of anyone who has not a mine store.

Q. (By Mr. SYMTH.) How do you sell goods to your miners?—A. By a system of accounts. They come in and draw according to their requirements, and the amount is charged up to them and deducted at the end of the month from their wages.

Q. Do you pay once a month?—A. Yes.

Q. (By Mr. A. L. HARRIS.) You do not pay in scrip—store orders?—A. Not regular scrip; it is what we call a store order.

Q. (By Representative LIVINGSTON.) Can they trade all through the week?—A. Generally most of the orders are drawn for from 50 cents to \$2.

Q. (By Mr. RATCHFORD.) What proportion of the miners of your district under that system receive any currency on pay day for their month's work?—A. I could not tell you the exact percentage, but our pay rolls generally run heavy.

Q. Do most of your miners have some cash to draw on pay day?—A. Yes, the majority of them.

Q. You have stated that both the tenement and company-store systems are general in your district. What effect do these systems have toward the suppression of strikes or the bringing about of strikes?—A. I do not think they have ever cut any figure.

Q. Have you ever known any instances in your State where miners on a strike were ordered out of the company houses?—A. Yes; I have never known of men hesitating to go on strikes because they lived in company houses.

Q. Have you ever known of any instances where they were refused store goods?—A. When not due them.

Q. (By Representative LIVINGSTON.) Is it an accommodation to your laborers to have the store near by where they can go at night or any other time to get their supplies?—A. All stores are usually located in the central part of the property, where they are convenient to the men. Their weight sheets are posted and all their accounts are kept there, and the men naturally go to the store as a sort of meeting place.

Q. Suppose the village store should be 5 miles away, would your employees lose time if they had to go there to buy their supplies?—A. Very often they would send their children; they do now; they go to the neighboring stores. For instance, I think there are some three or four stores within about a mile and a half or 2 miles of my village and there are some stores across the river.

Q. Then there is competition?—A. Oh, yes; and there are two little boats coming up the river every day from Charleston. That is a city of good size, the capital of the State; there are also a couple of passenger trains a day, and they go down and shop.

Q. They can take their money at the end of the week when you pay off and go to these places and buy what they want?—A. Yes; and they do it to a considerable extent.

Q. (By Mr. RATCHFORD.) In your experience as a coal operator have you ever learned of a miner being dismissed from employment because of his refusal to deal with the store?—A. I do not know of any specific cases.

Q. Have you ever found that the miner who does deal with the company store and who has a large family gets an advantage as compared with others?—A. I have never known any case of that kind myself; but where a man has a large family and helps in the store, it would be perfectly natural for the operator to help in return.

Q. (By Mr. PHILLIPS.) As a rule, is there any difference in prices in the company store and the store in the village or near-by towns?—A. No; we generally

aim to draw custom and trade. A rival store will very often make a cut rate on some branded article or some special articles, but on the general run of goods the prices are very much the same.

Q. (By Mr. RATCHFORD.) Have you anything to say on convict-labor laws?—A. We have no convict labor there.

Q. Are you a believer in arbitration?—A. Yes; where it can be arranged by mutual agreement; but it frequently happens that there are cases where compulsory arbitration would work a hardship on one party or another.

Q. (By Representative LIVINGSTON.) What is the condition of the families you employ; do they have sufficient food to eat and clothes to wear when they are at work, or are they stinted?—A. I think their condition is generally good; it seems to me much better than when I first came into the district. A good many of the men have accumulated properties of their own, and a good many of them are able to have organs and pianos and live very comfortably. As a general thing the miners require a good quality of goods and supplies, and if you go through most of our villages and notice the men, women, and children there, you will find that they are nicely dressed. They have their churches and their schools, and education is almost universal.

Q. What nationality do you employ?—A. Americans almost altogether, and a few English and Irish descendants—almost altogether native Americans.

Q. (By Mr. PHILLIPS.) Are they chiefly from that section of the country?—A. Yes; most of our men are from Virginia or West Virginia.

Q. (By Mr. RATCHFORD.) How often are your men paid their wages?—A. We have always paid once a month, as our rail coal is sold for settlement about the 20th of the month for the shipments of the preceding month. Barge coal is sold upon 3 or 4 months' time generally.

Q. (By Representative LIVINGSTON.) Do you pay in money?—A. Yes; in money.

Q. (By Mr. RATCHFORD.) Do you think monthly payments are satisfactory?—A. I think they are.

Q. Do you believe they are satisfactory to the workingmen who receive their wages?—A. Most good workingmen, if they get their pay regularly once a month, can get along very nicely. It is the rule with railroads and a great many large enterprises. Many of the operators are not able to pay oftener.

Q. What have you to say in respect to the shorter workday?—A. I am opposed to the shorter workday. If there should be legislation to curtail the general hours of labor, I would much rather have it taken from one special day in the week than 2 hours from each day. Ten hours seem to be about the right number.

Q. What have you to say in reference to cooperation, premium payments, profit sharing, industrial copartnership?—A. I am inclined to believe that in the time to come there will be a more general arrangement with labor for a division of profits. It is starting in that direction and has been worked very successfully in quite a number of places. The Proctor & Gamble Company in Cincinnati have a profit-sharing system that has been in use for a number of years and has attracted quite a good deal of attention. One of the coal companies in our district has had a profit-sharing basis and it has worked very well. It is a growth and will be developed in the future.

Q. (By Mr. NORTH.) What is the name of that mining company?—A. Campbells Creek Coal Company.

Q. (By Mr. RATCHFORD.) Do you believe that system is to be encouraged?—A. I should think it would be encouraged; I think it is a move in the right direction.

Q. How does immigration affect labor in your district?—A. We know practically nothing of immigration in our district. I think a number of years ago some Belgians were brought over, but they scattered through the country. That was the only attempt to bring labor in from foreign countries.

Q. Have you any suggestions to offer for the regulation of the immigration?—A. Nothing beyond the laws already in force, which seem to be right and proper.

Q. Have you anything to say in reference to the sufficiency of the public school facilities in the several States?—A. The school facilities are good in our district. There are more schools in Kanawha County than in any other county in the State.

Q. Are they adapted to the needs of the working people?—A. In a primary way; that is, they comprise the elementary studies.

Q. Do you know whether your own or any other company store receives a percentage on its business from the wholesale houses furnishing goods—that is, are these goods bought under the same conditions as where competition is free in the cities?—A. They are so far as I know.

Q. (By Mr. A. L. HARRIS.) What becomes of the coal that passes through the screen?—A. It is shipped away and sold for fuel.

Q. Into what grades is it separated?—A. Most of it goes out in a mixed grade of the nut and the slack together.

Q. Is that valuable for shipment?—A. You get something for it; about 1 cent a bushel, 25 cents a ton.

Q. Do you separate the nut from the slack before it leaves the mines?—A. No; not very often.

Q. Does the miner get anything for the coal that passes through the screens?—A. No; but he gets an extra price for the coal that passes over the screen.

Q. Is your price based upon the lump coal?—A. It is on the lump-coal basis.

Q. Is your lump coal simply weighed?—A. Yes.

STATE OF WEST VIRGINIA,
COUNTY OF KANAWHA.

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

NEIL ROBINSON.

Sworn and subscribed before me this 3d day of July, 1899.

J. B. PEYTON, JR., *Notary Public.*

WASHINGTON, D. C., April 10, 1899.

TESTIMONY OF MR. HENRY STEPHENSON,

Member of the National Executive Board, United Mine Workers of America.

The commission met at 10.30 a. m., Vice-Chairman Phillips presiding. Mr. Henry Stephenson, of East Bank, W. Va., a member of the national executive board of the United Mine Workers of America, testified. The topical plan of inquiry on mining was followed.

Q. (By Mr. RATCHFORD.) How long have you served as a member of the national executive board of the United Mine Workers of America?—A. I am serving my fourth term.

Q. Prior to that, in what capacity have you served?—A. Mining coal, and a portion of that time I was in the mines and served as district secretary and president of District No. 17 for a number of years. I have not been employed altogether in the work of the national executive board except during the last 2 years.

Q. Have you been outside of the mines during that time?—A. Yes; outside of the mines during the last 2 years.

Q. What are the functions and purposes of the national executive board, and how many members constitute it?—A. At present it consists of eleven members, and its functions are to direct the workings of the national organization in the absence of the national conventions.

Q. (By Representative LIVINGSTON.) Do you mean you have the power of the national convention during the recess?—A. Yes; the executive board has.

Q. (By Mr. RATCHFORD.) Does that carry with it the power to declare strikes, order strikes off, levy assessments, etc.?—A. Yes, sir.

Q. (By Representative LIVINGSTON.) Does it carry with it the right to arbitrate and settle troubles as well as bring them on?—A. Yes. In fact, our organization is based upon the principle of arbitration and conciliation.

Q. (By Mr. RATCHFORD.) What have you to say in reference to the regulation of unions, their funds, and benefit features?—A. We derive our funds by assessment of 10 cents per month on the members, and we try to improve the condition of the mining trade, to secure better remuneration for our labor, to increase the prices paid for mining, etc. Sometimes, if any of our members meet with accidents, we try to relieve them in a financial way.

Q. Have you any stipulated weekly or monthly allowance for disabled members?—A. No; we have not.

Q. Have you any strike funds?—A. No; not at present. We can assess our members in case of a strike or lockout. We usually do this by assessments. There have been times in the history of the organization when we had separate funds for this purpose, but at present we have not.

Q. Is that special assessment a matter of frequent occurrence?—A. No; it is not.

Q. Has your executive board power to levy that assessment, if need be?—A. Yes.

Q. What have you to say as to the growth of your trade union?—A. It has had a forward tendency. At the present time I believe the wage workers, as a whole, are better organized than during any period in past years. Four years ago we had a very small membership, possibly 10,000. Now I believe we have over 100,000 paid-up membership.

Q. What is the total number of employees in the coal industry?—A. Two hundred and forty some thousand, I think.

Q. Is your organization allied with any other mining or other organization?—A. Yes; it is connected with the American Federation of Labor.

Q. (By Mr. PHILLIPS.) Have you any member on the executive board of the Federation of Labor?—A. Yes, sir; our national president is a member of the executive council of the American Federation of Labor.

Q. (By Mr. KENNEDY.) Are there any Knights of Labor in the coal trade now?—A. There may be some two or three locals—possibly half a dozen—but they do not amount to anything.

Q. Was the organization composed chiefly of Knights of Labor at one time?—A. Yes. We had District 135 of the Knights of Labor, which was a strong organization at one time.

Q. Was there practically no other organization of miners at that time?—A. Yes; there was what they called the open part of the miners' organization; the Knights of Labor was the secret branch. Our members had the choice to enter the one they preferred.

Q. (By Mr. RATCHFORD.) What reason can you assign for the radical change in opinion which has caused your organization to go from the Knights of Labor to the present form?—A. They believe in managing their own affairs without the intervention of others; they believe that they are best able to judge what is best for them.

Q. (By Mr. KENNEDY.) When you were in the Knights of Labor, was there a good deal of interference in your work by men in other trades?—A. Yes; and they virtually controlled us, and we had to do their bidding in that way.

Q. (By Mr. RATCHFORD.) What does the American Federation of Labor do toward the regulation of mining affairs and the improvement of mining conditions?—A. In case of lockouts, strikes, and things of that sort, we may ask their cooperation, and they generally give it to us. They give us both financial and moral support, and help us to settle our difficulties. When we can not reach a settlement with our operators they assist us with their financial and moral aid.

Q. Do you favor the incorporation of trades unions?—A. No, I do not, because I believe the organization might at some time have to enter the courts to enforce its demands or contracts. If the organization was incorporated, a portion of our members who own their own homes would probably have them taken from them, whereas our members generally would be at no loss; the burden, if any case went against us, would be on the few.

Q. Is it a fact that even under a system of incorporation mining organizations that comply with the law need not fear any damages?—A. Yes; but sometimes we do not get justice. You must take that into consideration. If we would get justice we would not have much to fear and need not be incorporated.

Q. Is incorporation undesirable because the miners may wish to depart from a contract made with their employers?—A. No.

Q. Are those contracts usually observed?—A. Yes.

Q. By both sides?—A. Considering the national agreements that we have entered into lately, yes.

Q. (By Mr. PHILLIPS.) Would the property of members of the organization be affected by incorporation?—A. I have been led to believe that it would; that is, I have been told so. Of course, I do not know myself; I suppose not. We are in favor of the incorporation in order to put in practice the contracts we enter into; we are not afraid of anything of that sort.

Q. (By Senator DANIEL.) Are the trades unions generally incorporated?—A. No.

Q. (By Mr. RATCHFORD.) Is your association incorporated under the law?—A. No; we are not incorporated.

Q. (By Senator DANIEL.) Is your association merely voluntary?—A. Yes.

Q. (By Mr. PHILLIPS.) Do you know of any trades union that is incorporated?—A. No; I do not.

Q. (By Representative LIVINGSTON.) Have you no redress in the State of West Virginia for the violation of contracts at common law—if a coal company offers the men so much wages and does not pay, can it not be sued at common law?—A. Yes.

Q. When you have been thrown out of employment for weeks, have you never sued for damages in an action against the company?—A. There has been one or

two cases. I do not know whether they really pushed the matter or not. I am not positive on that point.

Q. (By Mr. RATCHFORD.) Are there any joint contracts made by the men and operators in West Virginia?—A. No; there are no contracts.

Q. (By Representative LIVINGSTON.) Do you mean to say you go to work there without any understanding, either expressed or implied; that you go to work without any contract?—A. Yes; the reasons are these: Though the previous witness testified here, we can rebut what he said. The operators, I am sorry to say, refused to meet —

Q. (By Senator DANIEL.) Whom do you mean by the operators?—A. The coal operators of West Virginia, the employers of labor. They refuse to meet the miners in joint conference. You may think that is strange, after the evidence given here this morning. They have there what they term a State organization of miners. Now, the real miners do not recognize that State organization as an association of miners. We do recognize it as a side show to the operators themselves; owned and controlled by them. They furnish the money to run it; consequently they control it.

Q. (By Mr. SMYTH.) Is it in affiliation with the Federation of Labor?—A. No; it is not. It was stated this morning that the operators had a joint conference and settled a scale of prices with miners belonging to the State organization of miners. The miners do not claim the State body as an organization of miners. To make it more plain, the operators furnish money to some half a dozen or more miners, whom we call or designate as "blacklegs," or, in other words, "scabs." They have those men call themselves an organization of miners.

Q. (By Mr. PHILLIPS.) Of the State of West Virginia?—A. Yes; of the State of West Virginia. The operators furnish them the money; in other words, pay their salaries to try to get this organization before the public, and of course the miners who mine the coal do not claim that body of men as representing them. The coal operators there did meet this committee and went through the form of entering into an agreement, but I want to say to the commission that the coal operators have positively refused to meet representative miners of our organization to settle on a scale of prices, and have refused to do so for a great number of years.

Q. (By Mr. SMYTH.) Will they meet the organization of West Virginia, but not the Federation of Labor?—A. Yes.

Q. Do you know if they furnish the money to pay for this organization?—A. Yes.

Q. (By Representative LIVINGSTON.) If I understand you, you do not recognize any contract or agreement between yourselves and the mine operators. Do you hold that it is your pleasure to stop work when you please and begin when you please?—A. Yes.

Q. Do you give them the same privilege of turning you off when they please?—A. They do it without asking our privilege.

Q. The law of West Virginia says—and there is a liability there that is just as binding as if it was written or signed—that he can not turn you off without being subject to damages.—A. Perhaps they are subject, but they have never been brought to time.

Q. (By Mr. SMYTH.) Do you live in West Virginia?—A. Yes.

Q. (By Representative LIVINGSTON.) By what method do these men who own mines ever get any labor at all?—A. Miners enter a mine at the operator's terms, with a claim that it is a contract, but not entered into by the miners and the operators.

Q. (By Mr. PHILLIPS.) Do they really dictate the terms and do the miners submit?—A. Yes.

Q. (By Mr. RATCHFORD.) What is the relation of your organization to non-union labor; for instance, your organization declares a strike; to what extent does that strike order affect nonunion labor; do they respond or refuse to respond?—A. Sometimes they respond, and sometimes they refuse; generally they respond.

Q. If the point at issue is raised by your organization, does it also affect the nonunion labor?—A. Yes; they receive the same benefit.

Q. Is the same true in case of an effort to resist a reduction in prices?—A. Yes.

Q. "Strikes, arbitration, and contract labor." Enumerate the several causes leading up to strikes.—A. Strikes generally are caused by a reduction, or the employers demanding a reduction in the prices of mining. The late general strike, or suspension, as we term it, was brought about for the purpose of increasing the prices of coal in the various markets, for the reason, as the operators said, time and again, they were not able to pay the miners a living wage. Creating a scarcity of coal in the various markets naturally raises the selling price of

coal, and would enable them to pay the miners the higher rate of wages. Those are some of the reasons that cause strikes.

Q. What were the prices paid in the mining districts of your State prior to the suspension?—A. Two cents a bushel for coal run over 1½ to 2 inch screens between bars 12 feet long by 6 feet wide.

Q. Is that the case in Ohio?—A. I am not so positive about Ohio, but it is possibly a quarter of a cent above that price.

Q. Do you remember the price in Pittsburg?—A. It is the same as in the Kanawha district.

Q. Is it a fact that prior to your late strike prices in the Pittsburg district came down from 79 cents a ton to 54 cents?—A. Yes.

Q. And in some cases to 45 cents?—A. Yes.

Q. Do you believe that the operators of whom we are now speaking were unable to pay higher prices than the prices that ruled?—A. They claim so; I am not positive myself; they claimed they were unable.

Q. (By Mr. A. L. HARRIS.) Will you please state what was the cause of these low prices of coal in the market?—A. I am not positive, but I think the operators underbid each other in the various markets to get trade.

Q. (By Mr. C. J. HARRIS.) Did they then go back and ask the employees to accept the reduced wages?—A. Yes; every time they will do that.

Q. Was the price of mining coal getting lower and lower under that strain of competition?—A. Yes.

Q. Indirectly, then, did you strike against the reduction in the price of coal in the market because it was injuring your pay?—A. Yes; that was the intention.

Q. (By Mr. RATCHFORD.) Have you any knowledge of the causes that operated in reducing the mining price so materially, other than the cutting of prices by operators?—A. I can not say, unless the railroads, by buying coal from mines in my district, had that effect. I am not well acquainted with their customs, but I have been told very often that when a railroad company would purchase coal from the mines, it would say to the operator, I will give so much for your coal and supply you with all the cars that you need—and I believe that had a tendency to reduce the price of mining.

Q. Was there not another cause, with which I believe you are familiar, that operated in the Pittsburg region—what is known as the De Armit্ত trouble?—A. The De Armit্ত Coal Company always claimed the right, I believe, to have its coal mined at 5 cents per ton lower than the neighboring operators; and having its coal mined at those figures, compelled other operators to ask a reduction of the miners' organization to meet that competition in the same markets.

Q. Has there been any instance in which the miners' organization granted that reduction?—A. Yes; the miners of the Pittsburg district, also the Ohio miners, voluntarily reduced the price of mining in order to meet competition.

Q. Do you remember the amount of the reduction?—A. I think it was about 20 cents per ton, possibly 2 years ago.

Q. What were the main causes that led to the strike—we have not covered that fully?—A. I might add the discharge of our members, and we have sometimes considerable trouble with the regulation of screens; sometimes strikes are caused by the operators not paying their employees at stipulated times during the month; various causes which we might enumerate.

Q. Is it a fact that strikes are avoided by the miners and operators treating with one another?—A. Yes.

Q. And that where they do not treat with one another the danger of strikes becomes greater?—A. Yes; we have more strikes where the miners are not organized than where organization exists.

Q. Are strikes beneficial or detrimental?—A. Strikes are detrimental as a whole; sometimes, of course, they prove beneficial; the miners wish to avoid them because they are detrimental to the interests at large.

Q. Do you believe fair means should be employed in order to avoid strikes?—A. Yes; I believe in conciliation. If we can not accomplish our ends by that means, then by arbitration.

Q. "Methods of strikes; of boycott; of blacklist; picketing or patrolling; other methods of influencing results, whether by employers or employees; sympathetic strikes"—what can you say on that topic?—A. Our method in conducting strikes is to use all fair means, issuing circular letters, etc. The operators usually use the blacklist against the miners and miners' officials who take an active interest in the organization.

Q. What do you mean by "fair means"?—A. To meet together with them and discuss the question.

Q. Anything that is unlawful?—A. No.

Q. Does your organization ever use the blacklist or the boycott?—A. No; excepting in trying to boycott coal. Our organization has attempted to get the public to purchase union-mined coal in preference to nonunion-mined coal.

Q. To what extent is this practiced, and against whom?—A. The first effort was made after the late suspension, against the unfair product of the State of West Virginia, a portion of Virginia, and a portion of Kentucky; in fact, where coal was not mined by union labor, or where the union scale was not paid.

Q. (By Mr. C. J. HARRIS.) Do you take the ground that coal not produced by union men is an unfair product?—A. Yes.

Q. (By Mr. RATCHFORD.) Is the blacklist used in your organization?—A. No.

Q. (By Mr. PHILLIPS.) Do you blacklist miners who do not belong to your union?—A. No.

Q. (By Senator DANIEL.) Who is put on the blacklist? Have you any definite information on that subject?—A. I know from my own individual case, at several mines in the Kanawha district I could not find employment.

Q. A man not finding employment and being on the blacklist are different things. Who puts people on the blacklist?—A. I know in this particular case some of our members went to a certain place to find employment. The clerk would run over a list of names and after looking over the list he would tell a certain individual that he did not have any work for him. That is what I consider a blacklist.

Q. What companies were they?—A. I can not call to my mind now—the Belmont Coal Company, Cedar Grove Coal Company, Riverside Coal Company, Winifred Coal Company, Carver Brothers, Campbell Creek Coal Company, M. T. Davis; that many I recall at the present time.

Q. Who are the men they had on the blacklist?—A. Robert Mitchell, Robert Stephenson, myself, Thomas Ferry, and if I had my notes I possibly could give fifty or more.

Q. Do you mean all those companies had all those men on the blacklist?—A. Yes.

Q. What were they blacklisted for?—A. To the best of my knowledge for taking an active part in building up the organization.

Q. Will you give the addresses of those people?—A. Belmont Coal Company, Crown Hill; Cedar Grove Coal Company, Cedar Grove; Riverside Coal Company, at Riverside; Winifred Coal Company, Winifred; Carver Brothers, Montgomery; M. T. Davis, Montgomery; Campbell Creek Coal Company, Malden, W. Va.

Q. Are you speaking of your personal knowledge in each of these cases?—A. To the best of my knowledge it is the case with these mines. Individuals have come to me and told me.

Q. (By Mr. C. J. HARRIS.) Have they seen the list in some cases?—A. Yes; the clerk looked over it in their presence, but of course he did not inform them it was a list.

Q. Was that your reason for believing it was the blacklist?—A. Yes.

Q. (By Mr. KENNEDY.) Do you know of any instance of men who have never incurred the displeasure of companies failing to get employment without trouble?—A. No; I can not recall any such instance.

Q. Would that help to confirm you in your belief that it was a blacklist?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Suppose he was discharged for incompetency or insubordination or laziness?—A. In cases of that kind our organization does not take any notice of such things, as we are really as much in favor of a man being discharged for such reasons as are the operators themselves, but we do not believe they should have the right to discharge our men for taking an active part in the organization.

Q. (By Mr. RATCHFORD.) Are there any methods employed by either the operators or miners to influence the results, aside from the boycott and black list?—A. The miners in our State sometimes call in influential men to help us to settle difficulties, and this we often do in our district.

Q. Have you "sympathetic strikes" in your trade?—A. Yes; they usually occur by one district coming out with another; that occurred in the late suspension.

Q. What district in the late suspension came out?—A. In a portion of our district during the agitation the operators voluntarily increased the miners' wages, thereby trying to keep them at work. In order to make our strike successful they came out, and it was said they came out in sympathy.

Q. If a strike was successful, is it a fact that the miners of your State would share equally with others?—A. Yes.

Q. In that case would it be a sympathetic strike?—A. Of course; they would gain in wages, etc., if successful.

Q. "The importation of new or foreign labor, under contract or otherwise." What have you to say in regard to that topic?—A. So far as importation of labor from other countries is concerned, I do not know. We had a strike on Loup Creek last December and the operators went to the State of Virginia and imported labor for the mines, and during last summer the operators in our district, thinking that possibly there would be a strike for better wages, went to the State of Virginia and hired a lot of colored men to come there and work in the mines; shipped carloads of them.

Q. What was the effect on your State?—A. It did not have much effect, for the reason that the labor that was imported there found out in a short time that they were lied to, and they returned home as fast as they could. They did not receive the wages they were promised. Some of them walked home and others rode on freight trains; they did not stay very long.

Q. "Conciliation, mediation, and arbitration."—A. As stated previously, our organization is based principally upon the principles of conciliation, mediation, and arbitration. We try to settle all our differences, when we can get the opportunity, by these methods, and refrain as much as possible from strikes.

Q. Do you speak of conciliation and mediation as referring to the coming together of representative men from the various parties in interest?—A. Yes.

Q. Do you find a greater number of your disputes are settled through these methods than through arbitration?—A. Yes.

Q. When you find it necessary to resort to arbitration, is each side represented voluntarily?—A. Yes.

Q. And as a temporary measure?—A. Yes.

Q. Does the organization which you represent believe in compulsory arbitration?—A. I can not say that it does at the present time, because they are getting along very well. Yes, if it can not be settled otherwise.

Q. Do they believe in the State making it compulsory?—A. Yes. That is the only way it can be brought about, through either State or national laws.

Q. Do you believe that where conciliation and mediation fail, and an effort to arbitrate the question by mutual consent fails, that it should be arbitrated compulsorily, rather than have the strike resorted to?—A. Yes.

Q. "The injunction in strikes." What have you to say about that?—A. The injunction was used very extensively in the strike of July, 1897, especially in the West Virginia district. The injunction even prevented men from walking along public highways; we could not meet our fellow miners to talk to them. They named in those injunctions men that were a thousand miles away from the scene of trouble.

Q. During that time were there any violations of law on the part of the miners?—A. No.

Q. Were there any prosecutions for violations?—A. There were prosecutions for not adhering to the injunctions. There were no prosecutions for violations of the law, to my knowledge.

Q. (By Mr. PHILLIPS.) That was in groups, was it not?—A. It enjoined our officials from going to certain mines; marching to and fro along certain highways.

Q. (By Mr. KENNEDY.) Do I understand you to say that injunctions in blocks were issued by courts and were filled out by persons?—A. I was so informed.

Q. (By Mr. RATCHFORD.) "Weekly, bimonthly, and monthly payment laws; advantages and disadvantages."—A. We have in the State of West Virginia a semimonthly pay law, but it is not enforced. I do not know one operator who complies with it.

Q. What is the feeling of the workman toward this law?—A. The workman is in favor of it; in fact, when before the legislature, before it was enacted into law, we petitioned that legislature for the law, not just in its present form, but we wished a two-weeks-pay law.

Q. Are the methods or times of payment in other districts competing with West Virginia on the same basis as those of West Virginia?—A. No, they are not; the districts that compete with West Virginia pay semimonthly.

Q. Are there laws to that effect in the different States?—A. Regardless of our laws, the operators do not pay us in West Virginia. Some of the States have laws, but I am not positive as to all of them; yet they pay semimonthly in other districts.

Q. Do you believe it an advantage to the workmen to receive their pay semimonthly?—A. Yes; because those who receive their pay oftener purchase the necessities of life where they can purchase them most reasonably, because in company stores they charge 25 per cent higher for their goods than outside dealers do. If they have the money they find they can take advantage of it.

Q. (By Mr. PHILLIPS.) Do you believe it is the rule that company stores charge 25 per cent more than others?—A. Yes; statistics prove it.

Q. Are they doing it to-day?—A. Yes.

Q. (By Mr. RATCHFORD.) "Time work; piecework; overtime work." Have you any of that in the mines?—A. I suppose we have; that is, by the hour.

Q. By the hour; by the piece.—A. Yes; I might say that it operates in West Virginia to a large extent.

Q. Have you task work in the mines?—A. I do not understand that question.

Q. My definition of it is contract work.—A. Not to a large extent. There are some few cases, I think, but not general.

Q. "Sliding wage scales, operation of; minimum wage scales." Any such things in the mines?—A. No.

Q. (By Senator DANIEL.) What is the average wage paid the miners in the West Virginia mines?—A. Seventy-five cents and a fraction, taking it from the mine inspector's report.

Q. How many hours?—A. Ten and one-half.

Q. (By Mr. PHILLIPS.) Do they generally work by the ton or bushel?—A. Both ways. The mines ran in the year of 1897 197 days. I find they made on the average 75 cents and a fraction a day, taking the working days in the year.

Q. (By Mr. RATCHFORD.) What would be the average pay for a day's work?—A. I am not positive on that.

Q. (By Senator DANIEL.) What does the miner who works by the day get on the average for his day's work?—A. The average for a day, I suppose, will run about \$1.25. There are mines, of course, in which you can make more than that; but there are a great many that make less. What we call a first-class miner will make possibly \$1.75. Sometimes a miner who has a very nice place would go a little higher than that, but on the average they do not make over \$1.25.

Q. What is the cost of living, as a rule?—A. I do not figure on the individual man, but in my State it generally takes all they can make. Very few of them save any money out of what they earn at the present time. A few years back they saved a little money, but at the present time they do not lay up any for a rainy day.

Q. Is the tendency of wages to increase or otherwise?—A. In our district we have not had any increase in wages lately.

Q. (By Mr. PHILLIPS.) Do they mine chiefly by the ton or by the bushel in your district?—A. Principally by the ton, excepting in the Kanawha district, where they mine by the bushel.

Q. What is the price per ton for mining at the present time?—A. It runs from 20 cents up to 40 cents; 40 cents, I think, is the highest.

Q. (By Senator DANIEL.) What is a ton of coal worth at the mines?—A. Taking the mine inspector's report, I think they get on the average 67 cents a ton when they sell to the railroad.

Q. F. o. b.?—A. Yes.

Q. (By Mr. RATCHFORD.) What is it worth to the retail trade?—A. We pay at the rate of 4 cents a bushel.

Q. (By Senator DANIEL.) That is at the mine?—A. Yes; that is for our fire coal.

Q. (By Mr. RATCHFORD.) What has been the advance per ton for mining in the States surrounding West Virginia in the past 18 months or 2 years, according to your recollection?—A. Fifteen cents.

Q. What has been the advance in your State during that time?—A. Nothing at all.

Q. What has been the reduction of hours of labor in other States than yours?—A. Two to 2½ hours.

Q. What has been the reduction of hours in your State?—A. None at all.

Q. (By Senator DANIEL.) Specify the States.—A. States of Illinois, Indiana, the Pittsburg district of Pennsylvania, Ohio, a portion of Iowa and a portion of Kentucky.

Q. How is it in Virginia?—A. Same as West Virginia, no reduction, no change.

Q. (By Mr. RATCHFORD.) What have you to state in connection with store orders and payment in kind?—A. Most of the company stores in our State use what we call checks, pasteboard checks. The companies give them to the employees for certain amounts at their respective stores, not transferable. They take them and deal from the company stores the amounts contained in the figures on the checks. Sometimes some of them are very generous and will allow you a little money, if you ask for a quarter or half a dollar. They might advance you a little out of the cash drawer. The checks generally state, I think, "Good after one year," or "One year after date * * * promise to pay to bearer," etc., the amount designated.

Q. They are gotten up in the form of coupons, are they?—A. Yes.

Q. Are they recognized in any other institution?—A. Not transferable.

Q. Is it true that you have companies in your State that issue scrip that is negotiable, passes as currency in any business house, and is redeemed at about 80 per cent of its face value?—A. It used to be practiced, but I am not positive about it at the present time.

Q. (By Senator DANIEL.) State what companies have issued this scrip.—A. Take the mine inspector's report and get every company's address, and you can easily find out. To the best of my knowledge all of the companies in West Virginia issue those store orders. I can not recall them all now, but virtually all use the checks or store orders.

Q. (By Mr. RATCHFORD.) Are those stores generally operated by the mining companies?—A. Yes.

Q. What have you to say regarding the influence brought to bear upon employees to deal in these stores?—A. To the best of my knowledge a great deal of influence is brought to bear. I know of instances where the miners have told me that they were compelled to deal considerably out of the store or find employment elsewhere. I know of instances where the miners have moved to private houses and have had to move back to the company's house in order to get their share of the employment. One particular case was the Belmont Coal Company. It is an established fact in that district that unless you purchase very nearly all that you make out of the company store, they have no use for you. There are some exceptions to the rule, of course.

Q. Do the company stores handle almost everything the miners use—clothes, shoes, hats, etc.?—A. Yes.

Q. What is flour worth per barrel in the company stores?—A. From \$5 to \$7 at the present time.

Q. Can you enumerate a few other articles?—A. Miners' oil generally runs from 40 to 80 cents; sugar, they generally sell you 15 pounds for \$1; Arbuckle's coffee, 12½ to 20 cents a package. Some stores charge more than others. Ham meat is generally 12½ to 17 cents a pound; bacon, from 8 to 12½ cents; canned goods, such as tomatoes, generally 2 cans for 25 cents; corn, same. A few days before I left home I got a barrel of best grade of flour from a private store for \$3.85.

Q. That same grade bought out of the company store would cost you what?—A. Cost \$6, at the lowest calculation.

Q. (By Senator DANIEL.) What class of people, as a rule, are miners in West Virginia?—A. We have all nationalities; mostly native-born West Virginians.

Q. What proportion of the miners in West Virginia would you say were native-born people of West Virginia?—A. I should judge about one-half; of course I have not the exact figures.

Q. And the other half are made up of different nationalities?—A. Yes; from various countries.

Q. Any predominance of nationality among them?—A. No; pretty well divided up—English, Irish, Germans, some Hungarians, Swedes, and so on like that.

Q. Any colored men among them?—A. Yes; great many colored men in the State of West Virginia, principally in the New River district.

Q. (By Mr. SMYTH.) Do you include them among the native West Virginians when you speak of the half?—A. Yes.

Q. (By Mr. KENNEDY.) The commission is informed that the employees generally are very well satisfied with the company stores in the mining districts of West Virginia. Do you suppose the commission would get valuable information on that subject by sending a subcommission to West Virginia districts to investigate?—A. Yes; I think they can get direct information.

Q. Do you think the miners would freely testify—those who work in the mines and are not organized?—A. Well, in this way, if they were informed that their names would not be used—that is, that the lash would not be held over them, they would give you the information. It would be otherwise if it were made public and the operators would find it out; the men would hesitate.

Q. (By Senator DANIEL.) Could we get it from the operators themselves if we put them on the stand?—A. You could from some of them. We have some fair operators in the State.

Q. (By Mr. RATCHFORD.) Has your organization ever declared against the company stores?—A. Yes.

Q. Has it ever declared in favor of a semimonthly pay?—A. Yes; almost every year.

Q. (By Mr. C. J. HARRIS.) In your experience, is there not more drunkenness among the hands and squandering of their wages when they are paid weekly than when they are paid monthly?—A. No.

Q. (By Mr. RATCHFORD.) Have you anything to say on the subject of fines and penalties?—A. No.

Q. Do the operators of your State usually house their miners?—A. Yes. At all the mines they own nearly all the houses the miners live in. Some call them houses, while others do not. Some have different names for them. They are usually made out of boards, what they call straight-up-and-down boards, with a narrow board on the outside to cover the seam between the two planks, and canvassed on the inside with what we call thick wall paper. In some few instances the companies have respectable houses. For those, though, they generally charge such a rent that the miners can hardly ever live in one of them.

Q. Are tenement houses and company stores in connection with the mines more prevalent in your State than in other mining States?—A. Yes; I think so.

Q. What, in your opinion, is the influence of the company store and the tenement house on the miners in case of strikes?—A. In case of strike, the first thing the companies do in our districts is to give you a vacation notice. The miners readily understand what that means; it means, Either go back to your work at my figures or get out. In most cases they have no place to go to, and the operators use it in the way of a threat.

Q. (By Mr. SMYTH.) If the mine owner does not furnish these houses has the miner the land, a place where he could build his own house?—A. No; speaking generally; but they could find them in a great many cases; probably buy from individuals.

Q. Some of these mines being in remote sections, if the houses were not built by the mine owners, there would be no houses there, would there?—A. No; not generally.

Q. In the beginning it was necessary to have those houses?—A. Yes; they have a system of buying all the land, or leasing all the land, thereby preventing a miner, if he wished to, from purchasing a little ground on which to build.

Q. (By Senator DANIEL.) Can you suggest any remedy for that?—A. Only in so far that if we can get a law preventing the leasing of all available land in connection with public works.

Q. (By Mr. SMYTH.) Their reason or excuse for leasing the land is to get the mineral right?—A. Yes; they lease almost all available land, and it is done with the intention, of course, of keeping any outside individuals from erecting stores to sell goods. Of course, they look after that point, and the miners are virtually compelled to rent their houses. When they do that they are placed at a disadvantage.

Q. Still, if the mine owner was opening up a new mine, if he did not build the houses for these people to move into when they came to work for him it would be a great inconvenience to the miners, would it not?—A. I can not say that. A great many of the miners would not be able to build for themselves.

Q. It is not the case, then, that the mine owner would have to have those houses to induce miners to go to work?—A. They claim that. I am not sure of it myself.

Q. (By Mr. RATCHFORD.) Have you any knowledge of any mine in your State or out of your State where the operator paid the scale of wages and failed to get enough operatives to operate his plant, even though he had no stores?—A. No; I do not know of any one instance.

Q. Is there any other business the coal companies are in, as coal companies, outside of the store and tenement house, and run in connection with their mines, or otherwise?—A. Yes; in some instances they have saloons in connection with their mines.

Q. Do they issue scrip that is good in those saloons?—A. Well, I find that scrip is taken there; whether by their authority or not I can not say. Their scrip is taken there and a man can go there and purchase.

Q. Any other business?—A. Not that I know of; possibly they do. Of course, in the saloon business it is a few cases; it is not a general thing.

Q. Is there any undue influence exercised, to your knowledge, in the employment of school-teachers in mining localities by the coal companies?—A. Yes; I might say so.

Q. Can you name any cases?—A. Can not recall them just now. On the twentieth question, "Difference in wage scales in different States and sections," I might say that there is a great deal of difference; for instance, in the States of Indiana, Ohio, Illinois, and a portion of Pennsylvania they receive about 17 per cent higher wages than we do in West Virginia.

Q. (By Senator DANIEL.) Do you mine much block coal in West Virginia?—A. Yes. Block coal is in the basin between Montgomery and Charleston.

Q. (By Mr. RATCHFORD.) What have you to say of the relative rates of wages during the past, within your recollection?—A. Well, 15 or 16 years ago, possibly 20, wages were considerably higher than they are now; and they have come down, of course, and gone up, at various stages since that time.

Q. (By Mr. C. J. HARRIS.) Is the average higher or lower now than it was then?—A. In my district it is lower.

Q. (By Mr. RATCHFORD.) How much?—A. From three-fourths to a cent on the bushel.

Q. (By Mr. C. J. HARRIS.) What did you make 15 years ago per day, and what do you make now per day?—A. Very often at that time miners would make from \$100 to \$150 per month. Now, if the very best miners reach \$75 they think they are doing remarkably well. The usual price now won't reach \$40 a month. If a man makes \$75 now he has to have considerable help—he has boys in the mine.

Q. Is the cost of living as high now as it was then?—A. So far as I am able to judge I do not think there is much difference.

Q. (By Mr. RATCHFORD.) Can a man make \$75 in the mine?—A. I say with the aid of his boys—couple of boys, children you might say—two men—that is the way they are rated in our districts—take in boys and try to make it appear that they are making big wages, not counting the help they have.

Q. What is the social condition at the present time as compared with the time you speak of? Has it improved or otherwise?—A. Yes; it has improved.

Q. You believe that the standard of the working people is getting higher, getting more intelligent, and making better citizens?—A. Yes; that is my observation.

Q. What have you to say regarding the employment of children?—A. I think the employment of children, especially in the mines, is a curse to them—hard labor is a curse to them; it has an effect upon the growth of the children, also prevents them from acquiring an education, which I think very essential in this life—makes good citizens of them. To make useful citizens in society it is necessary that they should have an education.

Q. What effect has it on adult labor?—A. It has a tendency to keep wages down, because a man who takes his children into the mines can take out more than a man who depends upon his own labor.

Q. (By Mr. PHILLIPS.) Are there many children employed in the mines of West Virginia, and at what ages?—A. I think there are as many as in any other State.

Q. (By Mr. C. J. HARRIS.) Should not children be taught to work as well as other things when they are young?—A. Yes; but I do not think they should be taken into the mines until after they are 14 years of age. We have a law preventing their employment under 12 years, yet it is not adhered to in all cases.

Q. (By Mr. PHILLIPS.) What per cent of children do you think are employed in the mines in West Virginia?—A. Possibly 10 per cent—that is, after they are 12 years of age.

Q. (By Mr. RATCHFORD.) The influence of organized labor on wages?—A. Organized labor has a tendency to increase wages.

Q. Is that the history of organized trade, as far as you know?—A. Yes.

Q. Increases in what way, usually—by strikes or by peaceful agitation; conciliation?—A. By peaceful agitation.

Q. Do you believe that wages are oftener advanced through that means than by strikes?—A. Yes.

Q. (By Mr. KENNEDY.) Has the work of organized labor an influence to build up the wages of unorganized labor?—A. It has the same effect on unorganized as it has on organized; they reap the benefit.

Q. They reap the benefit without carrying the burden?—A. Yes.

Q. (By Mr. RATCHFORD.) What have you to say in regard to the causes of irregularity of employment in the mining industry; is it due to seasonal causes, or what is it due to, mainly?—A. I find more employment when there is a good market for coal.

Q. Do you believe that excessive production has a great deal to do with it?—A. Yes.

Q. The shorter workday, its effects where adopted, economic and social; arguments for and against; what have you to say in regard to that?—A. I would say that the shorter workday enables the workman to devote more time to improving his intellectual faculties, making him a better citizen in the different walks of life. When a man works long hours of course he has not the opportunity to improve his mind. After a man works 10 or 12 hours a day he is so exhausted that what little time for study he has is no advantage to him.

Q. Does the shorter workday obtain in your trade now?—A. In a portion of the field it does.

Q. How many States?—A. States of Illinois, Indiana, Ohio, portion of Pennsylvania, and a portion of some of the Western States.

Q. How has it been gained, by strikes or otherwise?—A. Methods of conciliation.

Q. Has it been satisfactory to both parties?—A. Yes; it has had such a good

effect that the operators and miners reiterated their former agreement in our last national convention. It certainly must have been beneficial to both sides, or there would have been a fight, possibly, to do away with it.

Q. Are there any reasons for believing that the 8-hour workday is more fully due the miners than it is to men working on top of the ground?—A. Yes; I think so. One reason in particular is that the miners, as a class, have to breathe impure air all the time they are in the mines. They are not supplied with the necessary amount of pure air. They are shut up from God's sunlight, and they have to work in powder smoke, breathe foul air that mules breathe, and so on, and I think that is sufficient cause why the miners, above any other trade, should have a shorter workday.

Q. Do you believe that the shorter workday in all trades would have a beneficial effect?—A. Most undoubtedly.

Q. Operation of existing laws about screens, company stores, etc.—what have you to say about them?—A. We have a law in West Virginia directing all coal companies to weigh their coal before screening. The operators, of course, fought this law and we took it into the courts. At the first hearing the supreme court of our State, with the four judges sitting on the bench, decided it constitutional by a unanimous opinion. The operators asked for a rehearing through their attorneys, and one of the supreme court judges was in favor of the rehearing, and usually when one asks it they all consent, and they gave the operators a rehearing, and when the case came up on the rehearing two were for and two against. Since then we have had some cases come up from the various circuit courts, and sometimes the judge would declare the law constitutional and in another instance another judge would decide it unconstitutional, and the matter was referred to the Supreme Court of the United States, and we have never been able to have a decision rendered there yet.

Q. (By Mr. PHILLIPS.) How long ago was that case carried up?—A. I think it was in 1891 that the law was passed. I can not just remember when the case was carried up to the Supreme Court.

Q. Several years ago?—A. Yes; 4 or 5 years. That is the way the matter stands in regard to the screens. In the New River district they have the run-of-mine system.

Q. (By Mr. RATCHFORD.) You have an antiscreen law in West Virginia, and also semimonthly pay law, both of which are violated by the employers?—A. Yes.

Q. Have you any laws in restraint of company stores?—A. No; I believe not, excepting as to the prices charged for store goods—regulating the selling price of goods. We had a law, but it was declared unconstitutional.

Q. In looking over the laws of West Virginia we find there is a law which provides for the payment in lawful money; is that also violated?—A. Yes.

Q. (By Mr. SMYTH.) What provisions are used in West Virginia for pumping fresh air into the mines—engines?—A. Yes. They have in some mines the fans; in other mines they have what they call the furnaces. Still, there is not the proper ventilation in the mines.

Q. Are there any mines there that have no fans or furnaces?—A. I can not say there are, except mines just opening up; but there are mines having furnaces and fans in which the air is not sufficient.

Q. (By Mr. RATCHFORD.) What reason can you assign for the insufficiency of air in the mines?—A. Neglect of duty of the mine boss or the superintendent.

Q. How about the mine inspection; is the force large enough?—A. The force is large enough, but for some reasons unknown to me they do not enforce the laws.

Q. How many inspectors have you in that State?—A. Four districts, and one chief. At first there was one, and then it was increased to two, then to three, and two years ago they increased it to five. They have been increasing it at each sitting of the legislature. The chief mine inspector's explanation is that the laws are not severe enough; that he has not the authority; but I differ with him in that respect.

Q. Is there any peculiar condition there as regards coal, or any of the surroundings, which prevents as good ventilation as is had in other States if the same precautions are taken?—A. None whatever. I claim it is merely a neglect of the duties of the mine inspector.

Q. "Corporations, premium payments, profit sharing, industrial copartnerships, etc." Have you anything to state on that?—A. As far as my knowledge goes, we have one coal company paying a premium, on the cooperative plan; but that same company has the coal mined for less than district prices, and I think they pay their premium out of the difference.

Q. Do you call that cooperation?—A. No; I do not. Others do.

Q. Has your organization ever at any time encouraged the formation of coop-

erative companies composed of workingmen?—A. Yes. I think there used to be a system in the old Knights of Labor; I do not know that we had it in the Mine Workers; but it used to be embodied in our platform, urging cooperation.

In answer to the thirty-third question ("Effects of immigration on employment of skilled and unskilled labor; on wages; on morale") I will say, as far as my recollection goes immigration has caused wages to decline.

The school age of children in our State is 12. The law says they must go to school until they are 12 years of age, and not be employed in the mines during school session.

Q. Can children under 12 be employed at any time?—A. No; not according to our statute.

Q. How about sufficiency of public-school facilities?—A. According to my recollection, we have not a sufficient number of months of schooling in the State of West Virginia. The board of education usually has the voters decide whether they shall have an extension of 1 or 2 months of school in addition to the regular months provided by the law. We only have at present 5 months in the year, and of course it is not sufficient.

I believe there should be public night schools for the laboring people, especially those who are compelled to labor. I believe it would be of great advantage to the working people in general if they had an opportunity to go to night school.

We have a convict labor law in our State, but no convicts are employed in the mines, to my knowledge.

Q. (By Mr. KENNEDY.) How is the convict labor of your State worked?—A. They can be let out by contract.

Q. Are they let out by contract?—A. I think they are in certain cases; but none of them work in the mines, to my knowledge. I believe that convict labor should be employed in making the public roads of each county in the State. This would prevent them from coming into competition with honest labor.

Q. (By Mr. RATCHFORD.) You believe they should be employed at some kind of work?—A. Not if it comes into direct competition with men who earn their living.

My recollection is that machinery has had a tendency to cause labor to go down; yet it is not very successful in our State. Those operators who run their mines by machinery are getting pretty tired of it.

Q. Sanitary and personal-safety laws.—A. The laws in the State of West Virginia are very good; but they are not enforced, and the miners in a great many of the mines suffer for the want of pure air. We have a law in the State of West Virginia giving us the right to employ a check weighman, but when we undertake to employ one the companies generally kick, and kick pretty hard; that is, the general run of them. There are some few exceptions.

Q. Have you any arbitration board or arbitration laws in your State?—A. No.

Q. Do you believe such a thing desirable?—A. Yes.

Q. Do you believe that the mining prices should be equalized in the several States competing with each other, so as to give to employers and employees an equal opportunity to get the same returns on their capital and to obtain a living for themselves and their families?—A. Yes; that is one of the fundamental principles of our organization—to treat each and every operator with exact justice.

Q. In the different contentions that have arisen, was it the object of your organization to reduce the profits of the employer or to secure from the employers a share of that which the market afforded?—A. It has been our intention to really increase profits and at the same time give us a fair share.

Q. Has your intention been to encourage the employer to organize and maintain higher prices, to the end that you may get a share of it?—A. Certainly; that is our intention.

Q. Have you any suggestions for remedial legislation?—A. No, excepting that they should be uniform in the different States; and of course each and every sitting of the legislature we are there, by representatives, urging suitable mining legislation in conformity with the other States.

Q. (By Mr. PHILLIPS.) What State do you consider most advanced in mining legislation?—A. Illinois.

Q. (By Mr. RATCHFORD.) Is your organization on record in favor of the run-of-mine system?—A. Yes.

Q. Do you think laws in some of the States provide for this?—A. Yes.

Q. Do you believe that general laws in all of the States would be of advantage to the mining trade?—A. Yes; I believe it would be beneficial.

Q. Both from the miners' standpoint and operators' standpoint?—A. Yes; I think they would both be mutually benefited, because it would place them on equality. This brings us back to the mode of screening. At the present time some

mines have 1½ inches, some 1½ inches, and some 2 inches. Those that have larger screens have the largest advantage, and in my district some of those that have the large screens really pay less for mining than those whose screens are 1½ inches, for the simple reason that their miners are not organized and take any price the operators give them.

Q. You referred to the screens as being one of the principal causes of strikes?—A. Yes.

Q. If such a law were enacted, do you believe it would be efficient and beneficial in so far as it would remove that one main cause of contention and strike?—

A. Yes; I believe if we had run-of-mine system in the entire competitive field, or in all of the districts, it would be beneficial and prevent many strikes.

Q. In your contention for the run-of-mine system, has your organization taken a position in favor of maintaining the prices that prevail under a screen system, or are you willing to reduce the mining price in proportion to the amounts of screenings?—A. Our organization has gone on record in favor of reducing the price of mining to equalize conditions in favor of run-of-mine system.

Q. (By Mr. A. L. HARRIS.) Would the run-of-mine system encourage what some operators call "dirty mining"?—A. It might in a few cases, but not as a rule.

Q. The objection would not be great enough to overcome the advantages of run-of-mine system?—A. No. We can bring up the same argument in regard to the screen. When they have a screen, we have the same right to expect they will employ inferior miners to get this small coal that comes through the screen.

Q. In regard to the product that runs through the upper screen, what becomes of the screenings?—A. They sell it—ship it to the market and sell it. As I stated a while ago, quotations in the Cincinnati market for screened coal were from 7 to 8 cents a bushel, and for nut coal and slack 4 cents per bushel.

Q. Have you a system of screens that separates the nut from the slack as it comes down?—A. Yes; some of them have.

Q. Some get nothing for that?—A. Nothing for either slack or nut coal. They claim they pay us a difference, but we do not see it in that light. So far as legislation is concerned, I would like to have legislation on this subject: The organization is in favor of an 8-hour workday—national 8-hour workday, and of all these mining laws, if possible, being made national.

Q. (By Mr. RATCHFORD.) Can you state the average wages per annum of a steady miner in your State, a man who will work every day there is work for him, during the past few years, or any of them?—A. I would say they make probably \$350. It will not go over \$350.

STATE OF WEST VIRGINIA, *County of Kanawha:*

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

HENRY STEPHENSON.

Sworn and subscribed before me this 5th day of July, 1899.

S. CHAPMAN,

*Notary Public in and for the County of Kanawha,
and State of West Virginia.*

WASHINGTON, D. C., *April 11, 1899.*

TESTIMONY OF MR. JOHN MITCHELL,

President of the United Mine Workers of America.

The commission met at 10.20 a. m., Vice-Chairman Phillips presiding. Mr. John Mitchell, president of the United Mine Workers of America, Stephenson Building, Indianapolis, Ind., was examined as a witness, the topical plan of inquiry on mining being followed.

Q. (By Mr. RATCHFORD.) You are a representative of the United Mine Workers?—A. I am president of the United Mine Workers of America.

Q. How long have you served in that capacity?—A. Since the 13th of January.

Q. Were you connected officially with the organization prior to that time in

any other capacity?—A. Yes; for the last two years I have held official positions in the organization.

Q. And prior to that time?—A. I was employed as a coal miner.

Q. The commission would like to know of the objects and regulations of your trade union, the constitution, funds, and benefit features of it.—A. I will quote from the preamble of our constitution (reading): "First, To secure an earning fully compatible with the dangers of our calling and the labor performed. Second. To establish, as speedily as possible and forever, our right to receive pay for labor performed in lawful money, and to rid ourselves of the iniquitous system of spending our money wherever our employers see fit to designate. Third. To secure the introduction of any and all well-defined and established appliances for the preservation of life, health, and limbs of all mine employees. Fourth. To reduce to the lowest possible minimum the awful catastrophes which have been sweeping our fellow-craftsmen to untimely graves by the thousands; by securing legislation looking to the most perfect system of ventilation, drainage, etc. Fifth. To enforce existing laws, and where none exist enact and enforce them; calling for a plentiful supply of suitable timber for supporting the roof, pillars, etc., and to have all working places rendered as free from water and impure air and poisonous gases as possible. Sixth. To uncompromisingly demand that 8 hours shall constitute a day's work, and that not more than 8 hours shall be worked in any one day in any mine worked. The very nature of our employment, shut out from the sunlight and pure air, working by the aid of artificial light (in no instance to exceed one candlepower), would in itself strongly indicate that, of all men, a coal miner has the most righteous claim to an 8-hour day. Seventh. To provide for the education of our children by lawfully prohibiting their employment until they have attained a reasonably satisfactory education, and in every case until they have attained 14 years of age. Eighth. To abrogate all laws which enable coal operators to cheat the miners, and to substitute laws which enable the miner, under the protection and majesty of the State, to have his coal properly weighed or measured, as the case may be. Ninth. To secure, by legislation, weekly payments in lawful money. Tenth. To render it impossible, by legislative enactment in every State (as is now the case in the State of Ohio), for coal operators or corporations to employ Pinkerton detectives or guards, or other forces (except the ordinary forces of the State), to take armed possession of the mines in cases of strikes or lockouts. Eleventh. To use all honorable means to maintain peace between ourselves and employers, adjusting all differences, so far as possible, by arbitration and conciliation, that strikes may become unnecessary." Those are the purposes of the organization.

Q. Have you any beneficial features attached to your organization?—A. No; the funds of our organization are derived by an assessment of 10 cents per member per month for the national organization. The national organization has no benefit features; but in many instances our district and local organizations have sick and death benefits, accident benefits, etc., by which their members pay from 10 to 50 cents per month, and that is paid out so much per week to members in the event of sickness or accident. A death benefit of \$50 is paid.

Q. Is that 10 cents per member a month, or any part of that, used for a defense fund or strike purposes?—A. Ordinarily no.

Q. Have you any such emergency fund?—A. No; in times of strikes we appeal to the miners of the country for financial assistance, by issuing an appeal to them to contribute from their earnings a part of their wages to support other workmen who are on strike.

Q. That is the common rule in your association, is it?—A. Yes.

Q. Does it serve the same purpose as a fund permanently established for that purpose would serve usually?—A. No; it is not as desirable, and it does not serve the purpose, for the reason that under that method one miner does not pay as much as another, and often there is not a sufficient amount of money raised to support the strike, to carry out the objects for which the assessment or appeal was made.

Q. Does this emergency fund enable you to win strikes at times that otherwise would have been lost?—A. Yes. In fact, the only way we have won our strikes has been by the funds that have been raised by that method.

Q. What has been the growth of your organization?—A. The United Mine Workers of America has increased its membership very rapidly since its organization. Its greatest growth has been within the last two years. There are employed in the coal mines of the entire country 397,701 miners and mine laborers. Of the total number about 78,000 are members of our organization, or about 20 per cent of the total number employed. Seventy-five per cent of our membership is confined to the four States of Pennsylvania, Ohio, Indiana, and Illinois.

Its membership as a whole is confined to 13 States and one Territory, namely: Pennsylvania, Ohio, Indiana, Illinois, Kentucky, Tennessee, Iowa, Kansas, Arkansas, Indian Territory, West Virginia, Alabama, and Michigan.

Q. What is the proportion, according to your judgment, of the organized miners?—A. Twenty per cent of the total miners of the country. Our per cent in those States is much larger. Ohio, Indiana, and Illinois have 70,000 miners, and nearly all of them are organized. The per cent is much less in other States.

Q. Does the influence of any action taken by your organization extend beyond its membership?—A. Yes.

Q. To what extent?—A. To the extent of securing for nonmembers the same conditions of employment in States where the organization is strong enough to make agreements with the employers. In other States its influence is favorably felt also. The organization, even when few in numbers, makes agreements that nonunion miners secure benefit from. By that I mean that in making our contracts and agreements, a contract or agreement never applies only to the members of the organization; it includes all miners, whether they are members or not, working in the mines where this contract is made.

Q. In case of a strike being ordered by your organization, what influence has that order upon nonmembers?—A. Very often the same as upon its members. They obey the order to strike frequently the same as the members do. They obey the mandate or agreement reached in convention, the conclusions of the conventions; that is, in States where we have an organization. States where there is no organization are not governed to any extent by our organization or the conclusions reached by it.

Q. (By Mr. C. J. HARRIS). Is there any fear or intimidation that leads them to join you in these strikes?—A. No; there is no intimidation.

Q. (By Mr. RATCHFORD). Is intimidation practiced by your union in the acquisition of members?—A. To a very small extent. Where our organization is so strong, where we get a very large number of miners organized, they sometimes refrain from working with men who are not members. There are isolated cases of that, the miners taking the position that as those men who are nonmembers have secured all the protection, all the benefits of organized labor, it is no more than fair that they should become members and pay their proportion of the expense.

Q. (By Mr. SMYTH). Are there colored members of the organization?—A. Yes.

Q. And received into full affiliation?—A. Yes; our constitution provides for their admittance as members; and in fact our obligation provides that we must not discriminate against any man on account of creed, color, or nationality.

Q. Have you the colored miners organized in West Virginia and Alabama?—A. In Alabama we have; not to any large extent in West Virginia.

Q. (By Mr. RATCHFORD.) Is that intimidation, if it be a proper word for it, that is used to influence men to join your organization one of your declarations of principles, or is it a custom that is sometimes resorted to by a local union?—A. It is not a declaration of principles, but exactly the contrary is true. Our organization only desires to have men become members by their own consent; and where that is done—they are only isolated cases—it is done entirely by the local union. They do not attempt to prevent the nonunion men from working, however.

Q. Are you affiliated with or allied with any other trade?—A. Yes; we are affiliated with the American Federation of Labor.

Q. What purpose is intended to be served by such an affiliation?—A. Mutual assistance in times of trouble, and principally to secure the enactment of such remedial legislation as may be necessary for the protection of working people.

Q. Have you found it advantageous to your trade?—A. Yes.

Q. Is the tendency of trade unions, generally speaking, toward affiliation with one another?—A. Yes; very much so.

Q. As to the incorporation of trades unions, feasibility, and legal effects?—A. I am not sufficiently familiar with the question to be able to answer it.

Q. Have you anything to say of the incorporation of trade unions?—A. I have nothing to say.

Q. What have you to say of your relations to nonunion labor and the right to liberty of contract?—A. We believe in a conciliatory policy and make every effort to induce nonunion miners to affiliate themselves with our organization. If they will not accept our proffers of friendship, and refuse to become members of our organization, we sometimes oppose them. By this I mean we do not make the same efforts to secure for them higher rates of wages or better conditions of employment. In some cases miners have declined to work in the same mines. On the matter of liberty of contract, I will say there is practically no liberty of contract. Miners must accept the terms of employment offered by employers or

receive no employment. The custom has been for employers to draft the contract themselves, and then request their employees to sign it; otherwise they receive no employment. In many cases this contract forces the miners to waive many of the rights and privileges which they believe to be absolutely essential to their liberty and happiness. For instance, it was specified in this contract that the employer should have the right to retain the earnings of the miners then in the hands of the company where the miner severed his connection with the company for the purpose of obtaining higher rates of wages and better conditions of employment.

Q. (By Mr. RATCHFORD.) You have said that there is no such thing as liberty of contract. In making that assertion, do you speak in general terms?—A. I speak of methods formerly employed by mine owners in making contracts with their employees. In the last two years an arrangement has been in force by which our contracts have been made by a joint meeting between the miners and operators in four States. For instance, in West Virginia, and many other States, the employer on the first of each year drafts a contract setting out the price per ton and the conditions of employment. The miner must either sign that or accept no employment. Miners are so poor and have so few opportunities that they are unable to leave that mining town, and it becomes a matter of absolute necessity to sign that contract. It requires the forfeiture of their earnings in the hands of the company if they fail to comply with the last letter of the contract they were compelled to sign. That is what is well known in mining circles as an iron-clad contract.

Q. (By Mr. C. J. HARRIS.) If you contract with the mine operator, you know you can sue him for breach. Now, on your side is it unfair for the men to give some guarantee that they will carry out their part of the contract?—A. At any time where contracts have been made mutually by the two parties it never required any guarantee of good faith by either party—always carried out any contract that was ever made, where it is made mutually. These contracts are not made mutually; they are made by the employer alone, and the employee can either become a party to it or he is refused employment.

Q. (By Mr. RATCHFORD.) When your association makes a contract with its employers, such as I believe was made in Chicago more than a year ago, and in Pittsburg more recently, is such a contract made of the free will of both parties?—A. Yes; it is a mutual contract, and in no instance has it ever been violated by the miners.

Q. (By Mr. C. J. HARRIS.) How long a time does it run?—A. For one year.

Q. (By Mr. SMYTH.) You have only had 2 years' experience, then, with this kind of a contract?—A. Some years ago we had the same method of adjusting our difficulties, but it went to pieces; it was not as successful.

Q. (By Mr. A. L. HARRIS.) In Ohio it has been in existence for a number of years?—A. Yes.

Q. (By Representative LIVINGSTON.) If a State law required a contract, which had the mutual assent of both parties, to be put in writing, would that help your mining people and be a protection to you?—A. I am inclined to think it would. However, as I understand it, these contracts have in many instances been carried to the courts, and the courts have held that they were contracts for the reason that, while it was true they were drafted only by the employers, the employee was not compelled to sign them in the eyes of the law. He had an opportunity of refusing; they did not force him to do it.

Q. (By Mr. RATCHFORD.) Please explain to the commission how these meetings were had, and how these contracts were made, signed, etc.—A. They were made by representatives of the mine owners and representatives of the mine workers' union meeting in joint convention, discussing the conditions of the market, competitive conditions, everything that concerns the coal industry, and as a result of their joint conclusions the contract is drafted and mutually signed by each party.

Q. Signed by the full representation or by some delegate?—A. Signed by the officers of the miners' organization, usually, and the delegates of the operators' associations.

Q. Are these operators' associations incorporated under the laws?—A. Not to my knowledge.

Q. They have an association that meets and draws up a contract?—A. No; they have not, I think.

Q. That being the case, you have no redress at law for the violation of this contract?—A. No.

Q. No more than the operators would have in case the miners violated it?—A. No.

Q. Is unskilled labor organized in your trade?—A. I will say that unskilled labor is organized in the mining industry in places where miners are organized.

Q. (By Mr. C. J. HARRIS.) Is not your organized labor rather hostile to unorganized?—A. I do not know that they are, as that term would imply it. There is no doubt that the opinion prevailing among organized miners is that one of their craftsmen who refuses to become a member of the trade organization is not only injuring himself, but is injuring the organized men, and we know it to be positively true that the wages of organized miners are affected by the lower wages paid unorganized miners. We believe it to be absolutely necessary that labor be organized, whether it be skilled or unskilled.

Q. As a matter of justice, do you admit that a man has the right to individual contracts, individualism in his contracts?—A. We recognize the fact that under the law he has the right to make those, but we regard the man who does it in the coal mines to be not only injuring himself but everyone else, and for that reason we disapprove of it. As a matter of policy, we condemn it.

Q. Is not the tendency of all your organizations to rather discourage individual superiority of one laborer over another; in other words, do they not tend to put every man on the same level?—A. Speaking for the miners' organization, yes. I want to make this qualification, that among miners there are no skilled and unskilled men, or very few. They are the same class of labor all the way through. We do not desire that the skilled workman shall receive as low wages as an unskilled laborer.

Q. (By Mr. SMYTH.) Could one man always make as much as another one?—A. He can if he works under the same conditions and if he is as strong a man; if he is physically able to do it. We do not seek to make our wage scale so that a weak man would earn as much as a strong one, because we work by the ton, and a strong man can always earn the most.

Q. (By Mr. C. J. HARRIS.) Is it your idea to conduct the payment of wages so that the man who mines his coal in a very dirty way shall receive about the same as the one who does it in a very skillful way?—A. No.

Q. Does not payment by the ton for the run of mine coal tend to that result?—A. Ordinarily speaking, I would say no. The skilled miner is the same as any other skilled workman. He seeks to mine his coal as well as he can under all circumstances. The run of mine system of mining coal, of weighing coal, would be an incentive for employers to employ skilled workmen in preference to unskilled men.

Q. Would it not be a benefit for some workmen to be very much superior to others?—A. That is not possible in coal mines. There are not the different classes or grades in coal mining that there are in any other industry. There is only one man out of every three or four hundred that can hold a position in a coal mine better than another one, and that would be a pit boss; but there is only one pit boss for each mine, so that the possibility of any large number of men becoming pit bosses is very remote.

Q. (By Mr. NORTH.) Do you not have overseers of sections?—A. Not usually in coal mines.

Q. (By Mr. RATCHFORD.) Would a man's strength, and his willingness to work, and his ability to produce in a proper way, assert itself as fully over an inferior or weaker man under the run of mine system as under the screen system?—A. Yes; the same difference exactly. The run of mine method of weighing coal places men more on an equality, as between different mining sections or different mines, for the reason that in different mines there is often employed a larger screen. The mine owner will put in a wider screen, and, as a result of that, a large per cent of the coal falls through the screen. The mine owner is able to mine coal cheaper than his competitor who is working with a smaller screen, and he then has advantages in the market and does the business there, and diverts it from the mines to which it properly belongs.

Q. What have you to say of strikes and arbitration?—A. There are many causes which produce strikes. The principal cause, however, is the resistance to reduction in wages, demands for increased wages, dissatisfaction with conditions of employment. Ordinarily our strikes have been in resistance to reductions in wages. There have also been strikes at mines because of the opposition of the mine owners to organizations, discharging men who were members of them, and in fact discharging men who took an active part in seeking to secure better conditions of employment, who spoke in meetings, etc., and attended conventions as delegates, and such as that. The men have often struck against the discharge of these men. We favor arbitration of differences between ourselves and employers, and ordinarily only resort to a strike when all other methods of adjusting our differences have failed.

Q. (By Mr. NORTH.) Public or private arbitration?—A. Our organization has gone on record as favoring arbitration, without defining the kind of arbitration it desires. I will say for myself that I favor public arbitration.

Q. (By Representative LIVINGSTON.) Compulsory?—A. No.

Q. What good would it do the United States Congress to pass an arbitration law if it was not compulsory and could be set aside on one side or the other?—A. I favor an arbitration law that would provide that arbitration must be held upon the application of either side of a contest or by the joint application of those engaged in the contest.

Q. That would be compulsory.—A. It would be only to the extent of making the award. I do not favor making the award compulsory.

Q. If the miners of West Virginia demanded an arbitration—a board of arbitration—and the operators refused, or vice versa, would you like to have a law to compel either party to accede, not to the award, but to the arbitration?—A. Let me explain that I favor a law creating a national board of arbitration, that would permit the board to go in and investigate a contest between employer and employee upon the application of either of them—a law that would give them a right to demand books, and all methods of investigation to determine the result. They make an award, and then I believe it should be a matter of public sentiment to enforce it.

Q. Why not go a step further and give either party the right to appeal from that award to the courts and then on up, if you want to, to the Supreme Court of the United States?—A. The objection laboring people have to it is that there is no way of enforcing an award of a board of arbitration except by fine, punishment, and so on. The only way you can enforce it with the employee would be by imprisonment. They have no money to pay fines; they have no property to put up as a forfeit, and the only way you could enforce it would be by imprisoning the miner if he would refuse to accede to the award of the board of arbitration; and for that reason we oppose it.

Q. Why do you want any law at all for arbitration, unless you want it complied with all along the line; do you just want to experiment with it?—A. No; we have such arbitration laws in States, and in instances where some of these arbitrations have taken place upon the application of one side it has done very much good; it has done a great deal to array public sentiment on the side of right. I do not know of one instance where the employees have ever refused to accept the award of a board of arbitrators when there was no law to bind them, that could compel them, but I have known of employers who have refused.

Q. (By Mr. PHILLIPS.) The State of Ohio has an arbitration law. Are you familiar with its workings? Have you had any arbitrations under that law?—A. I am not familiar with the arbitration law of Ohio. I am quite familiar with the arbitration law of Illinois, where we have had several cases.

Q. (By Mr. RATCHFORD.) What effect would a compulsory arbitration law, either of the States or nation, have upon either the employers or the employees in making demands that were unwarranted or unjust?—A. I am inclined to think it would encourage them, for the reason that either side might make a demand, knowing it must be arbitrated. In the hope of making better conditions of employment, the employees might do that; and the mine owners might do that in times of temporary depression and take their books before the board and point out that they were losing money on their investment. It is always true of coal that there are seasons when it is sold at nearly cost, but at other times they make very fair profits on their investments. At certain seasons of the year they might make a demand for a reduction of wages, call in the arbitrators, and secure a reduction in wages.

Q. (By Mr. SMYTH.) If the trade union was incorporated, how would that interfere; would the books be necessary?—A. Our books would not be necessary, because the books of our association never show anything about wages.

Q. Do they not show the agreement you make?—A. Yes.

Q. The agreement would show the wages, would it not?—A. But where agreements are made mutually there are no strikes.

Q. The agreements that you make are made public and put into the hands of all parties?—A. Yes. The very fact of an agreement being made would itself decide the award of the board of arbitration. The agreement would be evidence of itself that the employer had knowledge of a less rate of wages or the employee of a higher one, and necessarily there would not be any arbitration that would go into details. They would simply determine that you have an agreement, and properly so.

Q. (By Representative LIVINGSTON.) And stand by it?—A. Yes; certainly.

Q. (By Mr. RATCHFORD.) Has your organization any board of arbitration to act in case of emergency?—A. Yes; our national executive board is a board of arbitration for the miners.

Q. With power to arbitrate questions arising at all times?—A. Yes.

Q. Have you experienced any trouble with regard to your members accepting the decision of such board?—A. No; never have.

Q. Your association has followed the arbitration theory to the fullest extent in all cases before resorting to a strike, has it not?—A. Not in all cases. It is my opinion that at times when the market has become so demoralized and so chaotic that it has been necessary to engage in a general suspension of work in order to restore prices in the market, to make it possible for employers to pay living wages, in that case arbitration, I understand, has not been offered by the miners for the reason that it could not have any good result. Prices have been so demoralized at certain seasons, and run along for a year at a time, that it would be impossible for employers to pay higher rates of wages unless a suspension took effect, to take out of the market the coal that was stocked there, as was the case in 1897.

Q. (By Representative LIVINGSTON.) From your observation and from statistics you have at your command, have your miners lost as much by strikes as they would have lost by reduction of wages?—A. No. I will say the miners never lost anything by a strike. They never lost anything by being thrown out of employment one month. It is my opinion, however, that strikes among coal miners, when they are general in their character, tend to stagnate the business of the country, increase abnormally the cost of coal to the consumer, and result in extreme hardship to the purchasers of coal, particularly those engaged as wage-earners in other trades. In the miners' strike of 1897 they remained on strike 84 days. The miners worked as many days in that year as were worked in the preceding year, a year that had no strikes; and yet the amount of money earned in 1897 was more than that earned in 1896. This is accounted for by the fact that a higher rate of wages was paid after the strike than prior to it. The employers suffered heavy losses from the strike because of the necessity of their expending large amounts of money during strikes keeping property in repair, etc. The longest strike that has ever taken effect in the coal mines—that is, general strike—was that of 1897, when the miners remained idle for an average of 84 days. That year they worked more days than they did in the year preceding, in which there was no strike. The possible production or the capacity of the mines of the country is one-third greater, or 40 per cent greater, than the possible consumption of coal; so it is impossible for the miner, even under the most favorable circumstances, to work more than two-thirds of the time. Two-thirds of the time will produce more coal than is consumed. Last year, or 1897, the miners worked an average of 185 days.

Q. On your theory it is the employer and not the miner who loses the money by a strike?—A. Yes; that is true in a general strike. In a local strike or sectional strike the miner sometimes loses money; but to take all the strikes in which the coal miners have been engaged, the miners have gained rather than lost by their strikes, by preventing reductions in wages or obtaining increased wages. When strikes are only sectional, then the coal is supplied from some competing district. Then the miners in that district, those who have worked, gain money that would have gone to the striking district, and while the miners as a whole, in the aggregate, have lost nothing, the miners in some particular sections have lost. In 1897 the miners worked an average of 179 days. There were employed in that time 397,701 miners. They produced in that year 200,221,265 tons. The capacity of the mines is all of 100,000,000 tons greater than that. It would indicate that the capacity of the mines is about 40 per cent greater than the present output of them, and that the miners are necessarily thrown out of employment one-third of the time, or 40 per cent of the time.

Q. And then the miners do not complain of that as a hardship? They know it is the natural result?—A. Yes; they recognize that as a natural result. They take the position, however, that inasmuch as they can produce as much coal as is consumed in the country in two-thirds of the time, the hours of labor should be reduced to as many hours per day as would produce 200,000,000 tons.

Q. If in two-thirds of the time you can mine all the coal that the world wants during the whole 12 months and you reduce the hours of labor so as to employ all the time, making it an 8-hour day, that would throw all the loss of the output on the employer and the miner would get the entire advantage, would he not?—A. No; I think not.

Q. Do you want the wages the same?—A. The same per ton; that would make no difference. We do not work by the day, but by so much per ton.

Q. (By Mr. PHILLIPS.) Is it a fact that a man will dig as much coal in 8 hours as he would in 10, or about, at that kind of work? Does he not become so exhausted physically that he can do as much work in 8 hours as in 10?—A. I think a man can do more physical work in 8 hours than in 10. You occasionally meet a man that will dig more coal in 10 hours than in 8, but the average man will not.

Q. (By Representative LIVINGSTON.) I only wanted to see if you were not endeavoring to throw too much expense on the mine owner.—A. I do not see where we throw any. If coal is mined at 40 cents a ton, it is only going to cost the mine owner 40 cents. The cost to the mine owner is exactly the same, because he only pays at so much per ton, anyhow. It does not matter to the mine owner whether a man mines 20 or 2 tons of coal. There is no increase in cost to him.

Q. Unless the wear and tear of the plant and the management of the plant during the idle hours?—A. I think this is a very small matter.

Q. (By Mr. RATCHFORD.) Would time wasted be any more under the 8-hour system than under the 10-hour system?—A. No; exactly the same. It would be the same at the end of the year.

Q. You have the 8-hour workday in the four States in which you advise us that 75 per cent of your organization exists?—A. Yes; the States of Pennsylvania, Ohio, Indiana, and Illinois. I want to say further on the matter of cost of keeping up the mine at times when the mine is idle that if a mine worked 200 days at 10 hours a day it would amount to 2,000 hours' work for the year. At present they have worked 179 days, while there are 306 working days in the year; taking 200 days for my illustration, if they divided those 10 hours into a lesser workday, the mine would be idle exactly the same number of hours, anyhow.

Q. What have you to say of methods of strikes, boycotts, blacklist, and sympathetic strikes?—A. At times strikes are inaugurated at one mine or in one district; at other times what are termed general strikes occur. A general strike is only resorted to when the coal market becomes so demoralized and chaotic that it is absolutely necessary to curtail production, so that prices of coal may be restored and it is possible for employers to pay a higher rate of wages. The boycott is sometimes resorted to by employees. By this I mean that the miners refuse to purchase coal or other product which is not produced by union miners, or under fair conditions of employment. The blacklist has been one of the worst weapons labor has had to contend against. For instance, if a miner was discharged by a coal company for insisting upon better conditions of employment, or trying to induce his fellow-workmen to join his labor organization, he often found it impossible to find employment in the State where he then resided. It has always been difficult for our organization to secure proof that this method has been resorted to by employers. It is a well-known fact, however, that in the State of West Virginia if a man dares to assert the rights guaranteed him by the Constitution of the United States he is deprived of the opportunity to earn a living for himself and family by his employer, and many times is unable to secure employment at any other mine in the State. Sympathetic strikes are, in our judgment, not only justifiable, but many times absolutely necessary, by reason of the fact that the capacity of the coal mines is so much greater than the possible consumption of coal that when one district is compelled to engage in a strike, either in opposition to a reduction of wages or for an increase in wages, the markets can be supplied by mines in other districts, and this has often been done without loss or profit to the employers that engage in the contest. The operators in the district where work has not been suspended would enter into a combination with those in the striking district by which they would supply the trade and contracts of the operators on strike, giving them a share of the profits which accrued to those supplying the trade. This method made it necessary at times for miners in other districts to engage in what are called sympathetic strikes. Another reason which makes sympathetic strikes justifiable is the fact that coal is sold on such close margins that where the operators of one district secure, by strike or otherwise, a mining rate that is less than that paid in competing districts, it is only a question of time until the miners in other districts must accept either a less rate of wages or the business will be diverted from the districts to which it properly belongs, and will be secured by the operators paying the lower rate of wages. It is our experience that wages often are reduced in one district and not in another. The business that properly belongs to the district at work where higher wages are paid is diverted to the district where the lower rate is paid, thereby causing extreme hardships to those employed. The miners have grown to recognize the prevailing competition so well that they volunteered a reduction of 16 cents a ton in order to give the mine owner an opportunity to retain his trade and business. That was done in the Pittsburgh district, Pennsylvania, and miners in Ohio volunteered to the employer a reduction in wages.

Q. Did the employers request that that be done?—A. My understanding is that they had drawn the attention of the organization to the fact that their business was being diverted, and the only way they could run was by the miners accepting less wages, and the officers and members of the organization recognized the fairness of that position.

Q. Speaking of the trade being diverted to the cheapest point of production, do you find that this is caused sometimes by operators who are hostile to each other in a business sense, or do you find some operators will own mines in the different districts, and because of their large ownership of mines they will divert the trade to the cheapest one?—A. Yes, that is often true. Many operators own mines in Ohio and Pennsylvania. Ohio operators also own mines in West Virginia, and they often leave their mines almost idle in Ohio and Pennsylvania and mine their coal for markets in West Virginia, where it is mined the cheapest.

Q. Have you anything to say on the importation of new or foreign labor under contract or otherwise, or the operation of the law forbidding the importation of contract labor?—A. Within recent years the importation of new or foreign labor has not been as serious a factor in determining the wage question in coal mines as it formerly was. Years ago shiploads of immigrants were imported from continental Europe, and were brought to mining points where miners were contending for better conditions of employment, and were given work that formerly belonged to American citizens. It appears, however, that the coal operators discovered that this class of labor was not as desirable as they had anticipated, for the reason that after being in this country for some time and becoming dissatisfied with conditions of employment themselves they would engage in strikes, and often, because of their inability to understand the English language and our form of government, they would resort to lawless acts, sometimes going to the extent of destroying property. The law forbidding the importation of contract labor has assisted materially in preventing employers from securing foreign labor to displace American labor.

Q. What has been the experience of your organization in treating with that class of labor? Are they hard to control?—A. Sometimes extremely so. I speak of the non-English speaking people.

Q. (By Mr. C. J. HARRIS.) Are they more lawless than the other miners?—A. When they engage in a strike it is more difficult to control them than the English-speaking people. The immigrants from English-speaking countries of Europe have never been difficult to control, because they understand trade unions before leaving there.

Q. (By Mr. PHILLIPS.) And the understanding of English, perhaps, has something to do with it?—A. Yes.

Q. (By Mr. RATCHFORD.) What have you to say of the injunction in strikes?—A. Well, I would say that the injunction has been one of the most effective weapons that has ever been used to intimidate labor. We have cases where injunctions have been issued against our people, naming some few of our leading members and including all others, not naming them, who were members of our organization, enjoining them from the commission of crimes that they never intended to commit; enjoining them from walking on the public highways under the pretext that they were going forth for the purpose of destroying property, when they never intended to destroy it, and it is a matter of our industrial history that men have been imprisoned for months for contempt of court and had a trial afterwards for the crime they were supposed to have committed, and were never convicted of it, as in the case of Eugene V. Debs, in Chicago, who served 6 months' imprisonment for violating an injunction, and they never convicted him of the crime that he was supposed to have committed.

Q. Have you any cases in mind where an injunction was in operation to the disadvantage of your organization?—A. Yes. In the strike of 1897 an injunction was issued against one of the members of this commission, Mr. Ratchford, and many others in West Virginia, restricting them from approaching mines or roads that do approach mines, and, in fact, curtailing many of the privileges we usually regard as American liberty.

Q. How do you know they never intended to commit those acts? What was the history of the strike of 1897?—A. My chief reason is that we have had no intention of committing lawless acts. They had approached those mines prior to that time along the same streets, and did not commit any lawless acts. We had nearly 100,000 men engaged in the strike, and not one single act of lawlessness.

Q. What is the entire period covered by that strike, 84 days?—A. Yes.

Q. (By C. J. HARRIS.) Would there not be sufficient ground, where a large mob got together, of apprehending serious, unlawful acts such as to warrant the interference of courts?—A. No.

Q. What has been the history of coal mining strikes as a general thing in regard to violations and mob law and intimidation of others who wished to work, who were not organized labor?—A. I know of no instance in which a riot has been precipitated where it was because of the unlawful interference on the part of

the strikers. Most of my experience and observation has been that where riots have been precipitated it is because of the interference of Pinkerton men, armed guards, etc., attempting to intimidate the strikers. I might, as an illustration, draw your attention to Virden, Ill., where colored miners were imported from the Southern States, accompanied by armed guards, nonresidents of the State of Illinois. At that time the union men were gathered from all surrounding towns to meet those men when they arrived for the purpose of trying to induce them not to go into the mine and take their places. As soon as the train arrived the armed guards on the train, seeing the large number—thousands of miners—fired upon them and killed several of them; then the union miners took up their guns and returned the fire; the result was that 9 miners were killed and about 10 of the guards. The colored miners went on through and escaped. The forbearance, and the desire on the part of union miners to be lawful can not be overestimated in that case. The governor of the State of Illinois did not go to the trouble of calling out his troops to protect the colored men, who were then in Springfield, because he had perfect confidence of the union miners protecting them. In times of strikes the union men are never sworn in as guards to defend the property; the employer prefers to get guards from other sections.

Q. You use intimidation to prevent men from working in case of strikes; can you then justly complain of the courts intimidating the intimidators?—A. I know of know instance where they compelled men to refrain from working by intimidation.

Q. I understood you to say in your previous testimony that there was some intimidation?—A. I said at mines at work, where the mines were in operation and the union men were governing the mine, that they many times refused to accept employment if nonunion men were with them. I did not, however, refer to strikes at that time.

Q. (By Mr. RATCHFORD.) Do you believe you have the same right to assemble on the public highway as in a city hall?—A. Yes.

Q. Do you believe the working men on a strike should have the same rights as politicians or public meetings of any kind?—A. Exactly the same right.

Q. Without any fear of injunction?—A. Yes.

Q. Have you any cases or instances on record of any of the leaders of the miners' union directly or indirectly encouraging violations?—A. Exactly the contrary is true. They have always advised that care be exercised in observing the law. Without exception, the leaders of the miners always caution that care be used not to violate the law.

Q. (By Mr. C. J. HARRIS.) I do not doubt that in the case of the leaders; but as an actual fact is it not true that there are instances of actual violations—throwing of missiles, abusive language, and other overt acts—which would distinguish this from a common political meeting such as suggested here?—A. I will say from my own experience that I have seen more missiles thrown at political meetings than at labor meetings.

Q. (By Mr. RATCHFORD.) You are of the opinion that the injunction is a very great advantage to the employers in their efforts to deal with organized labor and a consequent disadvantage to the workmen?—A. Yes; I regard the injunction process to be the most dangerous weapon that has been used against labor, and I dare say that there is nothing that has done more to destroy the confidence of the working people in the judiciary of this country; that miners are usually very law-abiding, very patriotic, love their country, and respect their courts; but since this process of issuing injunctions against them has been inaugurated they are losing respect; they feel at times that the courts are against them, and it is a common expression during strikes, when injunctions are applied for, "The courts are against us—the troops are against us." They feel that the Government, through its judiciary, is not acting impartially between employee and employer.

Q. You believe that the injunction should be used where it properly belongs?—Yes, I believe in its proper application; I believe, however, that the laws are sufficiently stringent and severe to punish a man for a crime. I contend that the courts ought not to anticipate that a body of miners, of American citizens, are going to commit a crime; they have no right to assume you are going to commit a crime. These applications for injunctions have invariably been made through the mine operator or some man who had come there to take the place of the striking miner. One case I can relate at present, where thousands are about to be deported from Indian Territory for striking for better conditions of employment and the right to belong to labor unions. As soon as we ask a hearing on it, those men will leave the Territory who had sworn to this application for an injunction, showing that the injunction is issued often under unfair circumstances. The persons whom they are issued against often do not know that an application has been made for it. They issue temporary injunctions.

Q. (By Mr. C. J. HARRIS.) Would an injunction against a man who intended and meant to act in a perfectly legal way affect or harm him in any way?—A. If the injunction only provides that you shall not violate certain laws, we do not mind it. We take it as American citizens that the Government has no right to issue injunctions saying you are enjoined from the commission of a certain crime. We believe the law saying we shall not do that is enough.

Q. (By Mr. SMYTH.) Are all members of your coal miners' union American citizens?—A. No, not all of them.

Q. Are not a large proportion of them unnaturalized residents of this country?—A. No, I should say not; a very large per cent are Americans.

Q. A large number do not speak the English language?—A. Yes; part of Pennsylvania, where the organizations are not strong.

Q. You admit the right of the mine owner or operator to work what class of labor he pleases in his own mine?—A. Yes.

Q. It is his property?—A. Yes.

Q. If he chooses to prefer nonunion labor or imported labor from other States, has he a legal right to do so?—A. I suppose he has a legal right.

Q. Has he a moral right?—A. In my opinion he has not a moral right. I take the position that a coal company derives its right to exist from the State, and as soon as a corporation becomes a menace to the community it ought not to be there.

Q. Are not some owned by individuals?—A. Chartered by the State.

Q. Can not a man operate a mine without a charter?—A. I think ordinarily the coal companies are chartered. Speaking of the moral right of a corporation to import men from one State to another to work for any wages they feel disposed to pay, they have no right to do so for this reason: Ordinarily American citizens settle at a mine; they buy a home there; they become citizens of a place; they have interests there; they have helped make the mine and are a part of it. A reduction of wages is offered, which they refuse to accept. The employer goes down South or some other place and imports a large number of coal miners to take their places. It drives them away from the homes they have worked so hard for, driving their children on the streets or the town. They have no moral right to bring them there. When labor is imported from one point to another, it is generally under a misapprehension, misrepresentation that no trouble exists; that wages are much better than they are; that they can earn \$3 and \$4 a day. These men are brought there and do not find the conditions as they expected and consequently are not themselves benefited as largely as they should have been. It is my opinion that stringent law should be enacted making it illegal for corporations to advertise for men under false pretenses, to bring men from one point to another under misrepresentations.

Q. Do the miners own their own homes to a large extent in Illinois, Indiana, and Ohio?—A. It is to a larger extent in Illinois, Indiana, and Ohio than in other places.

Q. Are those men American citizens or foreign element?—A. Very largely American.

Q. (By Mr. KENNEDY.) Has the injunction been used largely for the purpose of preventing the miners from coming in contact with those who come to take their places, so that miners can not use lawful means to persuade them not to take work?—A. We believe that is the purpose of it, to prevent miners who were trying to get better conditions of employment from meeting and talking to the men who were at work.

Q. (By Mr. RATCHFORD.) Does the injunction usually restrict men from committing certain acts of violence; or does it restrict them from attending public meetings in anticipation of acts of violence; or does it restrict them from coming into that territory for any purpose?—A. Sometimes they are different in their character; some restrict them from all of those; from holding public meetings; from walking on the public highways, approaching property of coal companies where men are at work, and, in fact, they are got out in different shapes. Then there are what we call "blanket" injunctions. It includes every man that mines coal at times, every member of our organization; for instance, an injunction issued in Pennsylvania would include myself if I was in California.

Q. In case an employer found it necessary to import men, because of his inability to secure men to perform his work at the prevailing rate of wages that was paid in that district, would your organization object to it?—A. On the contrary, we would favor it.

Q. If your members at any time refused to work for the employer at the prevailing rate of wages, would your organization aid the latter in securing labor?—A. Yes; we have instances where our men have refused to work at the prevailing rate of wages, and when we called on them we told them they must either return to work or we would put men in their places.

Q. What methods prevail in your trade in the matter of wages and methods of payment?—A. In the States where our organization is strongest, the method of payment is by cash and coupons, store orders, etc. Payments are semimonthly, and we favor weekly payments; but our agreement is for semimonthly pay. I might say on the advantage of weekly pays, their advantages are best demonstrated by semimonthly as compared with monthly pay, which prevailed some time ago. It is only within recent years that miners have received a semimonthly pay. Laboring people can, when paid weekly, purchase provisions and other necessary supplies much cheaper than they can when they only receive payment for their labor once a month. This is accounted for by the fact that they are enabled to pay cash for articles purchased, instead of being compelled to purchase on the credit system. In mining centers the business interests have been largely benefited by the shorter pays and have not as many accounts unsettled as they did prior to the establishment of the semimonthly pay. The prevailing system in mining towns up to within the last two years has been to retain at least one-half month's earnings of the employee, this amount being continually held by the employer; for instance, if a man was employed on the first of the month he would not receive any pay until the 15th of the following month; he would then be paid for one month's work. You will readily understand that a miner, under these circumstances, would be compelled to buy on credit for at least one month and a half, or 45 days, before he would be able to pay any of his accounts. The two-week pay is an improvement, and we believe the weekly pay would eliminate all those objections. Another reason why weekly pay would be an advantage to the miners is the fact that when the pays are less frequent men are compelled often to buy provisions in company stores. This inducement would not be if their pay was given them each week. Provisions are purchased lower and much cheaper for cash than on credit.

Q. Do you have time or piece work in your trade?—A. The usual method in our industry is by tons; so much per ton.

Q. You have some day work, however?—A. They have a class of labor that works by the day; what we call mine laborers; men who do not mine coal; men who keep the mine in repair.

Q. How many such men are there on an average around the mine?—A. I think it will not exceed 7 per cent.

Q. In this connection you said the 8-hour workday has been granted?—A. Yes.

Q. When the employers granted the 8-hour workday did they grant with it that those men working by the day receive the same rate of wages for the day's work as they formerly received under the longer workday?—A. No; when the 8-hour workday was established in the mines the men working by the day were reduced in proportion—two hours.

Q. Was that voluntarily done on the part of your organization?—A. It was done by agreement with the operators.

Q. Have you any sliding scales or minimum wage scales?—A. No.

Q. (By Mr. NORTH.) What are the reasons that the sliding scale method can not be introduced into the mining industry as in the iron industry?—A. It has been little discussed by the two interests, the miners and the operators. Some years ago we used to have it locally. I think the sliding-scale wage would be very much favored by the miners provided a minimum wage scale was fixed that would give the miners a living wage; otherwise I do not think we would favor it; if by agreement we could fix a rate and we would receive no less. In Alabama they have that method; the wages of the miner are based on the fluctuation of the iron market.

Q. (By Mr. SMYTH.) That is, the iron miners—the coal miners too?—A. The coal miners too.

Q. (By Mr. NORTH.) Why is that not feasible?—A. It is feasible, providing a minimum wage scale exists.

Q. Is it not practiced in the English mines to some extent?—A. I think that it is. I understand that the organization in England has a method by which wages advance or decrease.

Q. What do you mean by living wage?—A. A wage that would afford a worker a sufficient amount of money to enable him to live as we believe workingman should live, educate his children, clothe them properly, and to save sufficient to enable him to live when old, if he live frugally and reasonably correct.

Q. Do you think the operator should pay that wage irrespective of whether he can do so without a loss?—A. No. If they all paid it there would not be any loss. That would be a solution of the entire question, because if they all paid it that would fix the price of coal.

Q. Fix the price of coal in the market?—A. It would certainly fix it so far as the operator selling it is concerned. As it is, of course they all do not pay the

same rate of wages, and the market becomes overstocked by coming in and trying to cut prices.

Q. (By Mr. RATCHFORD.) According to your definition of a living wage, have you that to-day?—No; the miners have not, generally; in some of the States we have.

Q. (By Mr. PHILLIPS.) What you would consider a living wage for all would be such wages as would support a man with a family, regardless of whether he is married or single or has a family of 5 or 8 children?—A. That would permit him to have a home of his own. If he was not married he would have saved money, or he would get married, I suppose.

Q. (By Mr. NORTH.) Are most miners married?—A. Yes; as large a per cent as other citizens, I believe.

Q. You have a theory that a certain wage should be paid, irrespective of the earning capacity of the men?—A. No; I believe a living wage should be fixed.

Q. You regard living wage and minimum wage as synonymous terms?—A. No; minimum wage might not be a living wage to one part of our men; it might be to another; there are so many different standards of living. This is virtually true; there are many different classes of men who work in our mines—for instance, the people of continental Europe—the standard among whom is not as high as among the men American born.

Q. You think that a living wage should be fixed for all miners and a price put on the products in the mines and paid all persons engaged in mining operations?—A. Do not understand that I agree that the minimum wage or sliding scale would be feasible; but I agree that the sliding-scale method of fixing wages would be a part of the business, providing a minimum wage scale was fixed that would enable us to earn enough to support our families. However, I do not know of an organization that has advocated that within recent years.

Q. Suppose the cost of production under these circumstances were such that it cut off a great many poor people who had families to support, would it not create as much trouble in another direction?—A. I think not, for the reason that coal is cheaper in America than any country on earth.

Q. They would have to arrange, then, that wages paid other people would be enough to enable them to buy the miners' product, and give them also the opportunity to support their families. Would it not involve, in other words, a contract to be applied to all business vocations in which there were employees?—A. The price between wages paid now and what would be paid to the miner makes very little difference on 1 ton of coal, and necessarily would affect to a very small degree the producers of coal; for instance, the average price paid for mining coal now is 40 cents a ton; if that was increased to 60 cents a ton and the miners got a general average price, it certainly would not involve a hardship—20 cents a ton. A poor person only buys 1 ton of coal a month, so the effect would not be far-reaching.

Q. (By Mr. RATCHFORD.) What is the cost of coal in this country as compared with other coal-producing countries at the mines?—A. I think perhaps the coal is worth at the mines \$1 a ton more than it is here, and I think the price is \$1.75 at the mines. It will average about 99 cents at the mines here.

Q. Have you the figures of the approximate cost of coal in Great Britain in the mine?—A. No; I have not the figures with me.

Q. What is the average price at which it is sold at retail to the manufacturing and city centers?—A. I am not aware of what the average price is. I know that it varies very much on account of long and short hauls, etc., and upon different qualities of the coal.

Q. How much of the cost of the coal to the consumer is involved in transportation?—A. I think that the largest part of the cost of coal ordinarily is transportation.

Q. If you would take the average cost of coal at the mines and the average retail price at the center of consumption, could you tell whether or not it varies according to the transportation?—A. Ordinarily the price of long hauls is greater than short ones; the open rates are greater. However, coal is often hauled a long distance and sold cheaper than when it is hauled a short distance, owing to the competition and the grade of the coal.

Q. Owing to the competition transportation causes?—A. I think principally on account of the cheaper production and the better quality of coal. It may be of a better quality than coal mined close and sold at a less price.

Q. What have you to say of store orders and payment in kind?—The system of paying miners in store orders and coupons, etc., prevails almost generally in mining districts. The miners are universally opposed to it, and have always been; never held a convention that they did not pass resolutions condemning it. Many

of the States have passed laws making it unlawful, but they have been evaded by the companies placing the store in the name of some other firm or carrying the matter to the supreme court and having the law declared unconstitutional. Nearly all mining laws have been declared unconstitutional by our State supreme courts on the grounds that they abridged the right of private contract.

Q. (By Senator DANIEL.) You could not entirely annul agreements with the miners about the payment in checks and orders?—A. I presume that if the miners would sacrifice a sufficient amount of their pay to make up the difference, it can be done. That the system is unfair was demonstrated by the miners of Pennsylvania, who, at one time, attempted to make what was called a uniformity agreement among them. It carried with it a reduction of 5 cents per ton, provided the companies would abolish the stores, showing the miners are losing about 20 per cent of their wages because of this pernicious truck-store system.

Q. Do you think mines are sometimes continued in operation because of the profits of the store enabling the operator to continue, whereas if he had no store he would be obliged to shut up his mines?—A. I think where the truck stores prevail generally one operator must have them as well as another. If one operator closed his store, he would necessarily go out of the market. He would not have the same advantage as his competitor.

Q. Do you think there are any mines kept in operation by the profit of the store, whereas if there was no such store the mine would be closed?—A. No; I do not think the profits are so close that it would close their mines if the stores were abolished.

Q. (By Mr. RATCHFORD.) Do we understand that your organization has agreed to accept less wages for cash payments in Pittsburg?—A. I am not sufficiently acquainted with that transaction to know whether the organization itself gave its guaranty or not. I know the members and officers and conventions favored it.

Q. Does that carry with it that the operators who have no stores in connection with their mines are suffering a disadvantage, as compared to those who have stores, that is at least fully equal to the amount that the miner offers to work for less than the prevailing rate in order to get cash payments?—A. Yes; I think it does. It is unquestionably a disadvantage to the man who has no store. The profits in the store are often very much, for the reason that they do an enormous business. Many of their employees deal there when they do not desire to. I do not mean at present that they are compelled to, but there are better conditions of employment given to men who deal there; they can earn more wages. The one who refuses to buy there is often given unfavorable conditions of employment, and I have had cases come under my observation where the mine foreman would pass around and tell the men they had better buy more goods at the store—"You are not dealing much there now." The result has been that other business interests in the town have suffered to an extent that has been very undesirable.

Q. (By Mr. SMYTH.) But you have failed in every effort to close them by law?—A. Yes. In Illinois a law was enacted closing the truck stores. The company men, in evading the law, did not change the store, but when an employee went to the office and asked for a check it was understood he could get goods. The company would throw down \$5 in cash, and as soon as it was down the clerk would pull it back again and throw it in the drawer and give him the check. The inference was that he bought the check with money, and that he got the \$5 and traded it for the check, although the person did not get his hand on the money.

Q. (By Mr. KENNEDY.) You seemed a while ago to admit that if in a mining district a great number of the operators had company stores it was necessary for all of the operators to have them to compete, and then right after that you said that you did not believe the margin of profits was so close that it was necessary for any operators to have stores.—A. I say that while the company-store system prevails an operator operating in a district surrounded by company stores, in order to sell his coal to the same advantage that his competitors do, must have a company store. I do not believe, and I want it understood that way, that it is necessary for any operator to have a company store. The entire system ought to be abolished.

Q. You admitted that if certain mines in a district where the stores were general did not have stores they might be compelled to go out of business.—A. The chances are that he would be so crippled that he would be at a disadvantage.

Q. (By Mr. RATCHFORD.) Where a mining company owns the land, or at least where it has built the mining town, where there are 200 to 500 or 600 miners living, or even more, does the company allow other men to come in there and start another store? Do they allow competition in that business in that town?—A. Well, there are exceptions where they do not, but usually they do. Other stores can come and engage in business.

Q. In those cases the employee has no alternative, has he?—A. No; he is compelled to deal there.

Q. (By Mr. C. J. HARRIS.) Are not these stores a necessity in isolated places?—A. They may be at the time the mining town is started, but as soon as a fair number of men move there many others want to come in there.

Q. Is one of the objections of the laborers to trading at the company stores this, that whatever they owe is certainly deducted, and they have to pay, whereas if they trade with outside parties they can either pay or not, as they please?—A. No; I think that is not stating the objection right. The real objection is that they want to pay their bills; they desire to pay for what they buy with their money. They do not want the company to deduct it without the company giving them an opportunity to pay.

Q. (By Mr. SMYTH.) What inducement would there be for a merchant to indiscriminately credit the miners?—A. There would be no inducement. If the truck stores were abolished and weekly payments were established, the miner would certainly be able to pay all the time, without having credit. We very much disapprove the credit system.

Q. (By Mr. RATCHFORD.) What is the experience of merchants who are doing business in mining towns, trusting the workingmen for their necessities from one month to another; that the miners, as a rule, pay their bills?—A. Yes; they invariably pay them when they can. If they earn enough to pay for their living they pay for it, and that is the testimony and experience of business men in mining towns.

Q. Can you furnish this commission with any such testimony from merchants operating stores in mining villages where there are no company stores?—A. Yes.

Q. (By Representative LIVINGSTON.) Have you ever tried the cooperative store as an offset against any oppression that may come from an operator's store?—A. Yes. Our organization, as a whole, has not; but there have been cooperative stores often; frequently done.

Q. Is not that a clean-cut remedy for oppression on the other side?—A. No; for the reason that the men who deal in the cooperative store often do not get work. The man who deals in his own store does not get work; does not get as favorable conditions of employment; their opportunities to earn good wages are lessened.

Q. (By Mr. C. J. HARRIS.) Would not the outside store that gave indiscriminate credit lose so much in bad accounts that it would have to make its prices as high or higher than a company store, which, deducting these accounts at the end of the month, would lose nothing?—A. I think that is true.

Q. (By Representative LIVINGSTON.) Do you sign a contract to trade at these stores?—A. No. Our people sign an order for the money. They can legally collect it and keep it. They sign an order, and the very fact of not signing a contract does not lessen the reason why our people do it. It is a condition of favorable employment. There is a constant fear on the part of the employees that if they do not trade there they will not be treated as well. I regard a truck store as a standing menace to the welfare of the people of a community. It is a continual standing intimidation to the employee.

Q. Afraid not to deal there?—A. Yes.

Q. (By Mr. RATCHFORD.) Have you anything to say of fines and penalties?—A. Ordinarily in mines the only fines and penalties are for loading unclean coal. They take so much of your wages for doing it—very frequently more than should be taken—and then by discharge. I will say that our organization has laws requiring the miners to load clean coal. If we knew of miners loading unclean coal we would be the first to reprimand them for it.

Q. Has your organization or its representatives, to your knowledge, ever sanctioned the discharge of a man who refused to do what was right in this respect?—A. In many instances, where he repeatedly refused to do what was right.

Q. Believing he was doing an injury to his fellow-men as well as to the company?—A. Yes; we recognize the fact that upon loading clean coal depends the welfare of the operator as well as the employee. I want to say that the operators have frequently abused the privilege, for loading a piece of sulphur, for instance, not intentionally. It is impossible in coal mines for a miner to keep out all impurities. When it is loaded, and the miner does not see it, it is wrong then.

Q. The fines imposed on the men are not money fines, but rather fines on his day labor—dock so much coal from him—is that right?—A. Yes.

Q. (By Mr. SMYTH.) That is practically a money fine?—A. Yes.

Q. (By Mr. RATCHFORD.) Mine tenements—have you anything to say on that subject?—A. The tenements at mines are usually built of the very cheapest material; small in size, without any of the conveniences necessary for comfortable homes; no sanitary provisions; built in long rows, without fences in most cases;

in fact, most undesirable places to live; charges for rent exorbitant; and in many cases an employee pays as much rent in 3 or 4 years as the entire cost of the building amounted to. Usually a tenement house is built with straight boards; it is not weatherboarded in many cases. In distinctively mining towns, where no other industries prevail, you find straight boards, sometimes not plastered. Then the person who moves in them puts wall paper on at his own expense. They often have from three to five rooms. A 3-room house ordinarily rents for \$4 a month, 4-room house for \$6 a month, and 5-room house for \$8 a month. The cost of building them is very little, because of the cheapness of the material and the manner in which they are built. They are built very close together; probably 20 feet intervenes between one house and another, and probably one well will be sunk for 12 or 14 houses. I know of cases that came under my own observation in West Virginia where one well would have to suffice for 14 houses. Closets are also built one for three or four houses. They are very undesirable and unhealthy. Sanitary conditions are not at all proper, and, in my opinion, should be regulated by law.

Q. What is the general effect of the tenement house and the store being both operated and owned in connection with each coal mine?—A. The effect has been, in many instances where tenement houses were built by the companies, that there was no inducement for the miners to build homes of their own. The same influences are brought to bear upon a man to live in the company tenement house as to deal in the company store. The employee who will live in a company house is more desired by the company than one who lives in his own home. It is a very good source of large profit. The companies want them there because in times of labor disturbances they are more readily induced to return to work, because they can be ejected.

Q. (By Mr. SMYTH.) In the establishment of a new mine is it necessary for the mine owners to build new houses for the miners to live in?—A. Under those circumstances that is necessary; but these houses ordinarily are not built for that purpose, because if a company starts a mine in a large town where there is a large amount of vacant property they usually build, anyway.

Q. (By Mr. RATCHFORD.) Do you know of any employer who has been unable to get the amount of labor he desired, even though he did not build houses or own a store?—A. I do not know of any.

Q. What is the difference in wage scales in the different States and sections?—A. The wage schedule is practically the same in the States governed by our organization. The earning capacity of a man is about the same where we make our agreements.

Q. What have you to say of the relative rates of wages during the past 50 years?—A. I am not familiar with the relative rates of wages paid for the past 50 years, but I will say for the past 15 years the wages have undergone a constant downward tendency until 2 years ago, when our organization became so strong, and since that time we have regained some of our former losses.

Q. Has not the cost of your living decreased for the last 15 or 16 years, steadily?—A. Not in the proportion that wages have.

Q. (By Mr. SMYTH.) Does not a dollar buy more to-day than ever in the history of this country?—A. I think not. I think it won't buy more provisions in a mining town than ever before.

Q. (By Mr. C. J. HARRIS.) Have you any data on that point?—A. No; I have no data here, but I could easily submit to the commission the price lists of provisions in some mining towns, and I think they will be very conclusive proof that in many of our mining towns the price of living has not decreased in proportion to wages.

Q. (By Mr. SMYTH.) Can you give us the price list for the present year and 15 years ago? We could not make the comparison annually unless we had the two.—A. Comparing the prices in mining towns with those in ordinary cities would give the same result.

Q. (By Mr. RATCHFORD.) Has the standard of living of the miners increased during the time you speak of?—A. Yes; the desires and necessities of miners have increased the same as those of other citizens. They desire better homes, more luxuries, reading matter, etc.

Q. Social condition of labor during the past 50 years.—A. I have nothing to say on that more than that the large influx of immigrants into the mining districts during the past 50 years has done a great deal to lower the standard of living of the people there. The people from the non-English-speaking countries of Europe have made the change.

Q. (By Mr. SMYTH.) Would you say the conditions of miners are lower than of other vocations in this country?—A. I would say it was, in districts where the foreigners predominate.

Q. You believe that the presence of those people has prevented the same social advancement that otherwise would have taken place?—A. Yes.

Q. Is almost all the coal mining of Alabama done by negroes?—A. I am not aware that most of it is. I think about half of it is.

Q. So the effect on the white labor of the South, on account of the colored labor, would be the same as in the North on account of this influx of foreign population?—A. I think not to so great an extent, for the reason that the colored laborers of the South are not as desirous of working hard as those who are brought from Lithuania, Italy, Poland, Hungary, and those places. They come here, feeling at first that they are going to get wealthy. They used to work 15 hours a day. Stayed in the mines. The colored laborer of the South will not work hard. They are easy-going, and, while they will accept employment at low wages, they will not work as hard as will a man from continental Europe.

Q. (By Senator DANIEL.) Where the 8-hour system is adopted, do the men occupy themselves in other employments any portion of the working day?—A. No; it is impossible for them to. There is no other employment for them.

Q. You spoke about those men working 15 hours a day in the mines. Would they do the same thing all the time?—A. In the mines, they formerly did. They do not do it now.

Q. (By Mr. C. J. HARRIS.) Why were they doing that; to get money ahead?—A. I presume they were doing it for the purpose of accumulating money.

Q. What did they do with that money; go back to Europe?—A. It was a fallacy. They only believed they could accumulate money, but they did not do it. Some of them did buy little homes. Experience has shown that these long hours do not earn any more wages than the short. They came here, not understanding the laws of nature, and they thought they could work 15 hours a day and do double as much work as in one-half the number of hours.

Q. (By Mr. RATCHFORD.) What has been the influence of organized labor on wages?—A. The influence of organization on the wages of the miners has been very perceptible, and has secured for the miners, at least in some of the States, a fair share of the wealth their labor produces.

Q. (By Representative LIVINGSTON.) Do you not view these labor organizations as an absolute necessity, as a set-off against combinations on the other side?—A. Yes; I regard labor organizations as an absolute necessity.

Q. From the fact of the other side being combined?—A. Whether they did or not. It is probably more so now when the owners of property and mills and factories have combined, but it would be absolutely essential under any circumstances. There is no condition under which a labor organization could be dispensed with.

Q. You do it simply recognizing the fact that you are the weaker element in industry and, being the weaker element, you must organize for self-defense?—A. Yes.

Q. (By Mr. RATCHFORD.) Has there been any increase or decrease in number employed in your trade?—A. There has been a very large increase in the number employed; and at the present time 40 per cent more are employed in the mines than are required to produce the amount of coal produced annually.

Q. What are the effects of the employment of children?—A. The effect of the employment of children in coal mines has been very disastrous indeed. Miners work in foul and unhealthy air, even under the most favorable conditions, and where children are employed it necessarily injures their health, stunts their growth, and prevents the development of their mental faculties. Many times, too, because of less cost, boys are employed to perform the labor of men. Most of the mining States that are populous have, within recent years, enacted laws requiring that a boy must be at least 14 years of age before he can be employed in a coal mine. In States where our organization is strong they have a 14-year limit. I believe that is so in Pennsylvania, Ohio, Indiana, and Illinois. Those laws have been secured largely through the influence of organized labor—our organization and others. The effect of the employment of children is to decrease wages, by often making the child the breadwinner of the family; father thrown out of employment, while the boy supports him instead of the reverse being true.

Q. Does the influence of child labor reach into all classes of miners? For instance, if you find a man with three or four boys, and you find another man who, perhaps, has as large a family of girls; in one case we have three or four who are at work, in the other case we only have one who is the breadwinner of the family. If it comes to a question of competition between those men, who will succeed, and why?—A. The one having the boys would, because they would obtain work in the mine.

Q. Where no organization exists and the employer lays down the terms of employment, can the man who has the boys to help him always work at a less price than the man who has not.—A. Yes.

Q. What remedies, if any, would you suggest regarding the employment of children?—A. It is my opinion that such laws should be enacted as would prevent the employment of children in mines or factories until they had reached a reasonable age, and after that it should require that the hours of labor be regulated; for instance, a boy coming into the mines at 14 should not be required to remain in the mines as long as a man. That would be necessary in order to insure his health. I think a boy ought not to be in the mines more than 4 hours when he first starts to work there.

Q. Do you believe 14 years is a proper age at which to install them in the mines?—A. No; I think not. I think the age limit should be 16 years. Ordinarily a boy can not secure an education by the time he is 14 years of age.

Q. What are the hours of labor in the several States, and do you have Sunday labor?—A. We have an 8-hour work day in Pennsylvania, Ohio, Indiana, Illinois. About two-thirds of the miners of Iowa, half of the miners of Kentucky, and some of Tennessee work 8 hours per day. Sunday labor does not prevail but to a very limited extent in the coal mines.

Q. (By Mr. PHILLIPS.) The 8-hour day is for the miners alone, or is it general?—A. Miners only; miners and mine laborers.

Q. Is that enacted by the States?—A. No; it is an agreement between the miners and the employers. No State legislation on it at all.

Q. (By Mr. RATCHFORD.) What are the effects of the shorter workday?—A. The effect of the 8-hour workday in mining States has been most desirable. It has given employment to many men who, prior to its inauguration, were unable to secure work. Eight hours is a sufficient length of time to exhaust all men who perform hard labor. It has given laboring men more time to develop their intellects, and consequently has raised the standard of citizenship; has permitted men to spend more time with their families. It is my opinion that a law should be enacted, as far-reaching as it is possible for it to reach, making 8 hours a legal workday. There are several reasons why laboring people usually require this 8-hour workday; not only for the protection of their lives and to give them more time for the development of their intellects, but there are now so many men who have no employment that paths are being beaten along all railroads by men seeking employment.

Q. (By Mr. SMYTH.) Are there many men in this country out of employment to-day?—A. Not as many as there were sometime ago, but very many are out of employment; in fact, there is no industrial center where hundreds of men are not out of work, and the newspaper offices, when they post their bulletins of wants in the city where I am—a thrifty city, Indianapolis—crowds congregate there; men and boys start off to run to get a job. We believe that an 8-hour day, if established generally, would give employment to these people. Many of them have families and homes, and are good citizens. The fact that people have been out of employment has done as much as any other one thing to make men criminals. Unable to secure employment, they have become thieves, not in the general term, but they have stolen something to eat; they have degraded themselves and have gone from bad to worse; become frequenters of saloons and other bad places. It is my opinion that more good would result were a law enacted establishing an 8-hour day than any other one thing I can think of.

Q. (By Mr. A. L. HARRIS.) Have you in your mind a law that can be enacted by a State or the different States that could be made operative?—A. No; I understand it can not be done to make it apply to anything only work for the Government, or on product bought by the Government. I believe that the Government should require that where anything that is bought or manufactured for it, the contract should provide that the men only be employed 8 hours a day on it. The influence of a Government declaration, making it as far-reaching as under the law they can, would reach out and would eventually include all of the industries of this country. The trade-union movement everywhere is demanding the 8-hour workday.

Q. (By Mr. RATCHFORD.) What has been the experience of the miners and operators of those States you have mentioned from the time they agreed to adopt this 8-hour day? Is it mutually satisfactory to them, or is it objectionable to either party?—A. The employees have raised no objections. A very little has come from the employers. There has been some slight objection. They say that, ordinarily, if it were general they would prefer it to a 10-hour workday or a longer workday. Their objections have only been that it was not general and did not apply to their competitors in other districts.

Q. When such agreements were made they were made for how long?—A. One year.

Q. That year has expired.—A. Yes.

Q. What became of it?—A. A new agreement was made, on the same conditions, containing the 8-hour workday.

Q. Was that evidence of satisfaction?—A. Yes.

Q. (By Senator DANIEL.) Have you had much observation of the difference in the character of the work or the difference in the conditions of the workingmen when a day's work is 8 hours, and 10 or more?—A. In coal mines it is rather difficult to find the difference in the character of the work, but there is a difference in the men who work 8 and those who work 10; there is a great difference. The men who work 8 hours show all the indications of study. Usually, they are becoming more healthy, they are devoting more of their time to reading, and more at home with the families. In the winter months when they worked 10 hours, it was dark when they went to work and dark when they got home. Often children would not see their father for a week; they would be in bed when he left home and in bed when he came back. Under the 8-hour system he does more reading than he did formerly.

Q. (By Mr. RATCHFORD.) What are the hours of labor of miners in Great Britain, where trade unions are the oldest?—A. In most parts of England it is 8 hours, but in some parts 6. There is one county that is very thickly populated with miners where the hours are 6.

Q. Both parties, so far as you are aware, favor the shorter workday?—A. Yes; it has done very much to improve conditions in Great Britain. Miners have been raised from the very lowest standard of living until to-day they are regarded as among the most respectable class of citizens.

Q. When you stated that miners went to work early and returned late prior to the adoption of the 8-hour workday, did you refer to unorganized miners?—A. Yes; organized miners worked 10 hours. The organization always required that men work no more than 10 hours prior to the establishment of the 8-hour workday.

Q. Was trade diverted into the districts where the miners worked the longest hours?—A. Yes. Where the longest hours were worked, all mines having fixed expenses, those working the longest could necessarily produce work the cheapest. There is no question but that working those long hours reduces the fixed expenses, and they produce work somewhat cheaper, and those who buy coal buy it where they can buy the cheapest.

The history of short hours has always been increased wages. That has been invariably true. Wherever hours became shorter, wages increased. Day labor, for instance, will increase, and has increased wherever hours have been shortened.

Q. The matter of day labor alone would make the greatest difference, would it not?—A. It would be the principal difference.

Q. (By Senator DANIEL.) How was that when they got paid by the ton?—A. The day laborer does not.

Q. (By Mr. RATCHFORD.) Would a uniform workday in all of the States have a tendency to distribute the trade and give to each mining district its natural market?—A. That has been the experience so far—that it has distributed the trade equally, or as near as possible among the different districts, giving each of the operators his share of the business and his share of the profits; giving each of the miners their share of the work and an opportunity to earn their share of the wages.

Q. (By Mr. C. J. HARRIS.) Does that system give a fair chance to the ambitious man who is trying to get more comforts for his family and lay by money for a home?—A. There are men who for a time might go into a mine and work for 14 or 15 hours hard and earn considerably more wages, but for the protection of the class as a whole it is required that such men as those curb their ambitions, which practically mean the destruction of their health in the long run.

Q. Do you think it is hoggish for a man to want to get along in the world?—A. If he does it at the expense of somebody else; and working long hours on the part of one man necessarily means that some other man will have to work long hours.

Q. (By Mr. RATCHFORD.) What has been the operation of existing laws as to screens, company stores, etc.?—A. The laws which have been enacted for the regulation of screens and company stores have almost invariably been declared unconstitutional by the supreme courts for the reason that they abridged the right of private contract. I know of very few laws that have been enacted by State legislatures that have stood the test of the Supreme Court. In the mining States for a number of years the miners' organization and other organizations have sent lobbyists to the State legislatures asking that laws be enacted to abolish the truck stores and the screens and such things, and those requiring weekly payments, and they have always been declared unconstitutional.

Q. (By Mr. NORTH.) You think there is no form of law to cover these abuses

that would come within the Constitution?—A. Our experience has been that there is not; we have tried different laws. I have had some experience myself as a representative there in the interest of the organization, and we have tried framing the laws in different ways, and had our best attorneys draft those laws, and it appears that we have always been defeated in the courts.

Q. (By Mr. A. L. HARRIS.) You think there is no chance of framing a screen law, making it general in its application; to stand the test?—A. I am sure I do not know of any way. I do not know any way that it can be done in the State legislatures. It is my opinion that if laws were enacted that would prevent the intimidation in any way, or the influence of mine owners and employers from preventing their employees from becoming members of labor organizations, that the organizations themselves could do a great deal to regulate those abuses. But our difficulty has been that either by intimidation or compulsion, by making unfavorable conditions of employment, men have not been free to join labor organizations. They have not been free to assert what is certainly their right.

Q. Twenty per cent of the miners of the country belong to the organization?—A. To our organization. I may say there is another miners' organization in the Western States, called the Western Federation of Miners, that probably embraces, I think, from 6,000 to 7,000 coal miners.

Q. (By Mr. SMYTH.) Is there a miners' organization of West Virginia?—A. Yes; there is an organization that is composed of operators and miners; that has a very small per cent of miners in it. In fact, I think there is hardly 1 per cent of the miners that belong to it. Its strength, at least, is not known to us to be stronger than that.

Q. (By Mr. PHILLIPS.) About how many coal miners are there in the country?—A. Three hundred and ninety-three thousand.

Q. And the organization takes in how many of them?—A. Seventy thousand. I want to say that it is difficult for us to tell from our books what our membership is. We have a paid-up membership of 64,000. Our members who are on a strike are not paid up and, of course, we are unable to tell just what they are. We have a large membership that do not pay up that are actual members of the organization and their local unions do not send their full capitation tax to us, so we are not able to estimate the exact strength of our organization—that is, in numbers—but we know we have a paid-up membership of 64,000. We are numerically the strongest labor organization in the world.

Q. (By Mr. NORTH.) You mean by that in proportion to the total?—A. No; I mean merely that we have more members than any other labor organization.

Q. (By Mr. PHILLIPS.) In this country?—A. In numbers in the world.

Q. (By Mr. KENNEDY.) It must be, then, that you have a very large number whose dues are not kept up?—A. We have quite a number, but I think our paid-up membership is, from my information, stronger than any other.

Q. I am authoritatively informed that the international typographical union pays a larger capitation tax than any other?—A. They pay a larger tax, but they only pay on 30,000. They pay a larger capitation tax to the American Federation of Labor than we do. We pay on 16,000, but that does not help to tell the strength of the union, because they do not pay their full capitation taxes; but we are paying more this year than they do. We are paying on 30,000 members to the American Federation of Labor.

Q. (By Mr. PHILLIPS.) How many are there embraced in the American Federation of Labor?—A. The last report showed nearly 700,000.

Q. (By Mr. KENNEDY.) Do you know anything about the strength of the Knights of Labor?—A. I do not know its strength; it is regarded as being not strong.

Q. Practically extinct?—A. It is the opinion prevailing among trade-unions that they are losing strength every day; that their members are leaving them and affiliating with the American Federation of Labor.

Q. (By Mr. RATCHFORD.) Have you any cases in any of the States in which laws enacted in relation to screens or company stores have been found to be constitutional?—A. Not that I know of; I do not know of any.

Q. Coming to the fifth subdivision, cooperation, premium payments, industrial copartnership, etc.; what is the position of your organization on those topics?—A. I will say that as to the matter of regulating wages or division of profits, that our organization has never taken, to my knowledge, any action on that matter, and I do not know of any instances where profit-sharing has been introduced in the mining industry except the testimony given here yesterday of one case in West Virginia; that is the only instance I have ever heard of.

Q. Does your organization encourage cooperation—mining companies, for instance?—A. To some extent. We have a provision that permits cooperative

mining companies to retain membership in our organization, which practically gives it an indorsement. We favor cooperative stores.

Q. Have you anything to say of plans for improving the condition of workingmen: old age and service pensions?—A. In my opinion the Government should require that comfortable homes be furnished for the miners where they are built by coal companies; that they should have proper sanitary regulations and be built in a manner that would insure the health and comfort of those who reside in them. I think, too, that a plan whereby a portion of the profits of the mine owners and a portion, a per cent of the earnings of the miners, should be set aside and established as a sick-benefit fund. A fund to protect and care for aged miners when they become so old they are unable to work longer and support themselves would be an advisable reform.

Q. What have been the effects of immigration on employment and wages of skilled and unskilled labor?—A. My experience has been that the effect of the unrestricted immigration has done a great deal to depress wages; that it has driven from employment men who were entitled to the protection of our Government; and I take this position myself: it is my opinion that a law should be enacted prohibiting immigration of foreigners to this country at the present time for the reason that they are not only injuring American workmen, but that, because of the advertisements that are spread through Europe, Continental Europe particularly, setting forth the better conditions of employment here than there, large numbers are induced to come to this country, who, when they get here, not only injure American workmen but are deceived and injured themselves by finding the conditions of employment not as represented to them by the steamship companies who have advertised the favorable and desirable conditions of employment here.

Q. (By Mr. KENNEDY.) Do you believe that those workingmen in this country who are of foreign birth and are in the labor organizations are in favor of restricting immigration?—A. My experience is that they are now. There is, of course, a large element among them who are influenced by sentiment or feel that such views as those might be regarded as know-nothingism, that men would have no regard for a man because he was foreign in some other country; but looking at it in a broader view, the men who come here not only injure us but injure themselves, and I find a few among a large number of them favoring a restriction of immigration.

Q. The president of the American Federation of Labor is of foreign birth himself, and he is in favor of it?—A. I do not know his views on it.

Q. (By Mr. NORTH.) Have you ever taken a vote in your organization on the question of immigration?—A. No; never have. I understand the convention of our organization some time ago took quite strong grounds on the restriction of immigration, but not to prohibit immigration.

Q. (By Mr. A. L. HARRIS.) Do you remember what that restriction was?—A. I think at the time it was passed it was intended to apply against bringing labor in under contract; the contract labor which used to prevail very extensively, where employers would go to Continental Europe and contract for shiploads of those people. In fact, it is a matter of common knowledge among trade-unions, and coal miners particularly, that a few years ago a large shipload used to be brought here and kept by their agents at the port where they landed, ready to be sold out to striking companies; taken there to break up the strike and to be moved on giving their padrone, I think they call him, the right to pay so much apiece for those men to take them down and break the strike.

Q. (By Mr. PHILLIPS.) About what per cent are of foreign birth engaged in the mining industry?—A. We have no data on it, but it is my opinion that one-half of our employees are of foreign birth.

Q. What per cent of those are citizens of this country?—A. I will say that at least 75 per cent are citizens. A few years ago that was not so true, because at that time they were importing these non-English-speaking people by shiploads here, but that has been restricted.

Q. Are those of foreign birth favorable or unfavorable to restricted immigration, especially those who have come to this country within the last five or six years?—A. I would say that those from English-speaking countries would favor restricted immigration. I do not think that would be true of those from the non-English-speaking countries; they favor free immigration; they are desirous of bringing their people to this country.

Q. (By Mr. KENNEDY.) The foreigners who come to this country and engage in coal mining, who are not from English-speaking countries, are generally from the south of Europe, are they not?—A. Yes.

Q. (By Mr. RATCHFORD.) You speak of 25 per cent of those people being non-

citizens. Do you mean 25 per cent of the miners as a whole or 25 per cent of the one-half who are foreigners?—A. I speak of 25 per cent of the non-English-speaking foreigners.

Q. Do you care to make any suggestions for the regulation of immigration?—A. I favor the enactment of strict immigration laws, restrictive laws, and I think, too, that the system of permitting people to be induced to come to this country by false representations is entirely wrong, and if it could be restricted or prevented, it should be done by law. The effect of people coming here has been that they have driven from employment American workmen, who were getting, probably, living wages; and the immigrants coming here who have no employment are compelled because of poverty to work for less, and the immigrant does not understand the trade-unions ideas, and often takes employment of some men which should go to our own citizens, and causes them to join the great army of the unemployed and become tramps on the highways.

Q. (By Mr. A. L. HARRIS.) Will you please briefly outline the restrictions you would impose?—A. I would say that I have not given this matter the thought it deserves possibly, and could not very well outline just what restrictions should be imposed. I understand, of course, that a person who takes a position that the people coming from one country are not as welcome as those coming from another is liable to be represented as not having broad views. I do not need to tell this commission that I am not at all narrow in my views on the matter, but immigrants who come here from England, Ireland, and Scotland are, from a trade-union standpoint, much more desirable than those coming from other countries. The French people and German people are very good trade-union people, because they have trade-unions in their countries; but I know of no trade-unions in Hungary and Italy, and those people have been undesirable as far as our organization is concerned. I believe that the wage earners of the country, as a whole, would be benefited were we to have an entire prohibitory immigration law at the present time. We have so many men unemployed in the country that they would not discover that they needed workmen for a good many years, if there were no more immigrants that came here; this being true, too, that the immigrants coming to this country can no longer go on to farms, no longer go out West and take up vacant land and become self-supporting, because farming, like every other industry, has become so now that only those who can buy improved machinery are able to make a living at it.

Q. (By Mr. PHILLIPS.) You would favor the entire prohibition of immigration?—A. Yes; I would favor it for a limited time.

Q. Regardless of the family ties on both sides of the water? There are many relatives, father or brother or sisters, in Europe, that would like to join their families here.—A. I would not want to go to that extent of preventing the relatives of those who are already here from coming; but, of course, I understand that is an endless chain, that there is no end to the relatives; if they all came they would still leave relatives there.

Q. (By Mr. RATCHFORD.) Can you inform us fully of the recent trouble in the State of Illinois between the colored and white miners?—A. Colored labor has been and is now being used for the purpose of reducing the wages of workmen. They are imported in large numbers from Southern States to Northern States during strikes, lockouts, and labor disturbances, and are put in the mines, frequently working under guard. To prevent this it is my opinion that laws should be enacted making it a criminal offense for employers to induce laboring men to leave their homes and go to other places under misrepresentation. I might say, gentlemen, that the colored laborers have probably been used more to decrease the earnings in the mines of the workers there than in any other industry. The mine owners of the North and of the South, too, go to centers of industry and even into cotton fields; they induced those colored men to go to some other Northern town or mining town to take the places of the men when they are on a strike. They bring them in there in train loads under armed guards, and they unload them into the mines. Those people when they get down into the mines are able to earn about \$1.50. It is more than they get picking cotton or doing the ordinary roustabout work they do in the South. They have taken the places of the white miners and necessarily driven them from the towns they developed, where they have been living all their lives. I know of no element that is doing more to create disturbances in mining circles than is the system of importing colored labor to take white men's places and to take colored union men's places. Our organization does not make any distinction between classes; we regard the colored men fully as much entitled to protection as white men; we make no conditions. It is required that our organization shall treat them without discrimination. We have had during the last year many disturbances in

which lives have been lost and property destroyed because of the importation of these people from the South to the North. Information reaching us last night tell of the conflict at Pana, Ill., between the colored people and the white people, where the coal companies have imported colored people to take white people's places, and let me say this is done under most peculiar circumstances. In the conference between the miners and the operators, where the operator contended that his scale of wages was made too high, he appealed to our organization to have it remedied, to have it changed. Our officers immediately called a convention of miners and employers, both the interested parties, let them discuss the matter in all its details, and both of those parties refused to do it, claiming that the scale was exactly right. The company still refused to start the mine, and when the board of arbitration came together that is appointed by the governor, we agreed to submit it to them and they investigated the case, and they too declared that the scale the miners were demanding was fair, and that the company had just as much opportunity to sell its coal as any other company. The company again refused to start the mine. They appealed to the president of our organization and he appointed a committee to confer with them, and they found and declared that the scale was fair and that the company had not done as they agreed, and this company refused to open up its mines, and they went down South and brought these colored people up there and that resulted in the conflict at Pana. They were brought in there to take the places of the miners at the scale of wages which had been made by the miners and which the company refused to accept. The reports from Pana are that they shot five people. Many innocent people were in the fight and were injured, and among those innocent people were one lady, who got her arm shot off, and a man, a merchant there, who got shot in the back. This was brought about by the colored people imported from the South attempting to prevent their own number from leaving the town, to go away from there. Some of them had been induced by our boys to go away. They were doing nothing, and carried no arms but pocket knives, when their people who were there to take their places came out with guns and tried to stop them, which resulted in the riot.

Q. (By Mr. SMYTH.) Do the colored miners work for a less wage in Indiana and Illinois?—A. They do not; the wages of the miners who are organized are exactly the same.

Q. In the nonunion mines of Alabama they work for less wages.—A. Yes; they do work for less. Their standard of living is not as high, and consequently they must work for less.

Q. As a rule the colored miners are satisfied to work for less, are they not?—A. My opinion is that usually the colored persons in the mine are not satisfied to work to a large extent at all; but when they do work they will accept less than the white men.

Q. They are not so desirable a class of miners?—A. No; their standard of morality is not as high as that of white people; they are not as desirable citizens.

Q. (By Mr. RATCHFORD.) In speaking of the Illinois troubles you have reference to the Pana and Virden strikes, in which the riots occurred?—A. Yes.

Q. Are not the miners in both cases striking for the arbitration rate fixed by the miners' organizations, or rather for the price jointly fixed between the miners and operators?—A. Yes; fixed mutually between the operators of Illinois and the miners, and affirmed by the State board of arbitration and a private board of arbitration.

Q. The question was referred three times at the request of the operators; first, to the executive committees of both organizations; second, to the State arbitration board, and third, to the miners' union?—A. Yes.

Q. And in each case the verdict was in favor of the miners?—A. In each case the verdict was in favor of the miners; and the operators, who made a written agreement with us to accept the award of each one of these various courts—we have it a matter of record in our office; we have a contract with them to start that mine at the price that was fixed by these courts of arbitration—refused to do it even in the face of their own agreement.

Q. What was the position of the operators in the State of Illinois outside of the striking district in that respect?—A. They unanimously agreed that those companies should pay that price; that it was only fair; their competitors were paying it, and they should pay it, too.

Q. That is to say, they unanimously supported the miners in their movement?—A. Yes.

Q. (By Mr. C. J. HARRIS.) It might be a very great thing for these companies to accept this proposition, and still it would remain, after all was said and done there, to open their mines on their own basis, would it not?—A. No; they do recog-

nize the authority of the convention to determine a price. They had taken part in that convention; they had discussed the reason why they should or should not pay it; they participated in the meeting that was to determine the scale of wages that was fixed by that convention on the coal in the coal trade, freight rates, and everything, and then refused to become a party to it.

Q. (By Mr. RATCHFORD.) In other words, they helped to fix the same price on everyone in the State of Illinois?—A. Yes; they did that for everyone else, and had recognized a decision and authority of the convention to fix their scale of wages.

Q. (By Mr. C. J. HARRIS.) I fail yet to see, unless they had bound themselves up to a contract to accept a certain decision, why they would be obliged to work their mines on that scale unless they were a mind to.—A. We have a contract with them by which they agreed to accept the award of the board of arbitration, and the law of the State of Illinois requires that when an arbitration is held with the consent of each of the two parties, they must run the mine for 60 days, and the only difference is that the law has no penalty; but we take the position that a person is no less a criminal who violates a law that has no penalty than he would be were it a penitentiary offense.

Q. (By Mr. SMYTH.) Will you tell us what the proportion of colored miners is in the Alabama mines?—A. I have not any data on that, but from what I know of it I would say 50 per cent.

Q. And the organization in the South is mostly among the white miners?—A. In the districts where it prevails it takes them all in. Where we have an organization every man who works in the mine is a member of it. We do that by agreement with the coal companies that they employ union miners and that they recognize the organization and treat with it.

Q. Those organizations which employ union labor pay higher wages than those employing nonunion labor?—A. Yes.

Q. (By Mr. KENNEDY.) In Alabama you have unions in which there are both white and black members?—A. Yes.

Q. Are those whites who are in that organization natives or foreign born?—A. Very largely natives of Alabama.

Q. (By Mr. RATCHFORD.) Have you experienced any trouble in getting the white and black miners in the South to assimilate together into the same organization—the same union?—A. I will say there is no difficulty as far as our organization is concerned. They recognize—as a matter of necessity they were forced to recognize—the identity of interest. I suppose among miners, the same as other white men in the South, there is the same class differences, but they have been forced down, so that they must raise the colored man up or they go down, and they consequently have mixed together in their organization. There are cases where a colored man will be the officer of a local union—president of a local union.

Q. (By Mr. PHILLIPS.) With white members?—A. With white people in the same organization.

Q. And do they mine together in the same mines?—A. In the same mines, but frequently do not work together as partners. Ordinarily white men want to work by themselves as partners.

Q. (By Mr. SMYTH.) Are 50 per cent of the miners in Alabama in your organization?—A. Probably a larger per cent.

Q. (By Mr. PHILLIPS.) What per cent in Pennsylvania?—A. Our organization has less in proportion there than any other State.

Q. Is that due to so many foreigners being employed in Pennsylvania?—A. No; it is due to some extent to the unfair advantage taken by coal companies in central Pennsylvania. In the anthracite district of Pennsylvania, where there is employed, I presume, 150,000 miners, the operators oppose our organization so vigorously that we have been unable to make much progress.

Q. What have you to say of school facilities?—A. I will say in the Northern and Western States, as far west as Iowa, that the public schools are very efficient. I do not know that there are any objections by the trade unions to them there; but in the Southern States it is our experience that there is not a sufficiency of schools, nor in West Virginia.

Q. How about the Western States and Territories?—A. West of Iowa there is not as sufficiency of schools; at least, that has been my observation from the traveling I have done through those Western States. If the schools are not far apart, they are not of as high a standard as they are in Illinois, Ohio, Indiana, and Pennsylvania. One difficulty that should be overcome is supplying night schools for adults, so that men working in the mines or boys who have passed the school age can attend school at night, and those schools should be public schools, in my judgment.

Q. Have you anything to say on the question of convict labor?—A. Convict labor enters to a very small degree into the mining industry. Some years ago they used to have it in the Southern States, but to a very small extent; now it has been practically abolished. I think not in Alabama any more; they do to some extent in Tennessee, but not so much there as formerly.

Q. Have you any suggestions to offer for convict-labor employment?—A. I favor the proposition, that has been very generally discussed, of employing convicts in making good roads. In my judgment that is the most noncompetitive industry they could be engaged in.

Q. (By Mr. PHILLIPS.) In the Northern States they could not be engaged in that during the winter season, could they?—A. That would be a difficulty, but outside of that I believe they should only manufacture such productions and goods as are used by the State and Government, so that their product will not be placed in competition with other labor.

On the topic of concentration and consolidation, its effects on prices, profits, wages, employment, I desire to express it as a personal opinion that I am not opposed to either consolidation or concentration. I believe, however, that where manufacturing interests or industrial interests enter into combinations, trusts, etc., that it is generally for the purpose of cheapening the cost of production; that it makes it possible for employers to pay higher wages. It has been my experience, however, that they have not paid higher wages. I believe that they should be so regulated by law that the profits on those investments should be limited—should be regulated—on the actual amount of money invested. I certainly am opposed to paying dividends upon stock other than actual stock.

Q. (By Mr. RATCHFORD.) Have you anything to say on discrimination in freights?—A. It has been impossible for us to get any conclusive proof that there is any discrimination in freight any more than the force of circumstances, which have often led us to believe that there has been discrimination in freight rates. For instance, coal mined in West Virginia is in some cases shipped 200 miles and sold in markets 200 miles farther away than coal in other districts sold in the same market at a less price. We found that coal is shipped from the Fairmount district in West Virginia to Chicago and sold in competition with coal mined 60 miles from Chicago. We find coal going to Ohio and sold in the market when their published open rate is higher than that in Ohio. And this leads us to believe that they (the railroad companies) are giving advantages to coal mined in that State. We have been forced to believe that without being able to establish it as a matter of fact. We know that coal is sold at Cincinnati, mined in West Virginia, in competition with coal mined in Ohio, at prices that stamped the Ohio coal out of the market.

Q. (By Mr. PHILLIPS.) Is it not a fact that that West Virginia coal is better than the Ohio coal?—A. There is coal mined in West Virginia that is of a higher grade than the Ohio coal.

Q. Average as well?—A. I do not think it will average as well.

Q. (By Mr. RATCHFORD.) Is it not a fact that coal mined in some of these States you have mentioned is shipped to the lake front and sold for a less price than the advertised freight rate?—A. Yes; there has been coal shipped to the lake front and sold at a rate that was less than the advertised freight rate.

Q. (By Mr. C. J. HARRIS.) That was the West Virginia coal?—A. Yes.

Q. (By Mr. SMYTH.) You know that to be a fact?—A. I know it is a matter of common knowledge among coal dealers and men engaged in our duties.

Q. You do not know it of your own personal knowledge?—A. I have not purchased the coal myself or seen it sold.

Q. (By Mr. C. J. HARRIS.) You do not know that railroads make a secret rate to manufacturers on their roads less than the published rates, and that is done in all kinds of industry?—A. Yes; I know that it is done.

Q. (By Mr. RATCHFORD.) What can you say regarding the effects of machinery on prices, profits, and labor?—A. The effect of the introduction of mining machinery has tended to depress wages; decrease the earning capacity of men. It has cheapened the cost of production materially. I have not exact data as to the proportion of coal produced by machinery, but my recollection is that something like 40 per cent of the bituminous coal is produced by it.

Q. (By Mr. A. L. HARRIS.) In what way is this machinery used in the mines?—A. It is used to undercut coal; to dig and undercut an entire seam; but then they have another machine that is used for drilling the holes; that was formerly done by hand. I want to say that all coal a few years ago was undercut by hand; the men did it with the pick. Then there is another machine that drills the holes to put the powder in; that is done by machinery now; and a mine with one-half the force of men can produce as much as formerly it could by using double the force.

Q. (By Mr. PHILLIPS.) They use compressed air to run those machines.—A. Oh, no; electricity. Electricity is the prevailing fad now. It is what they call the electric-mining machine that does the work, and will do twice the work that the old compressed-air machine would.

Q. Did not the compressed-air machine improve the condition of the men?—A. It did. Where headings were driven it put some fresh air in there, but compressed air is very unhealthy for a man to live in, and while it made less smoke, it was an undesirable class of air. It was probably better than powder smoke.

Q. (By Mr. A. L. HARRIS.) Does it require the same experience as a miner to use a machine as it does to use a pick and drill?—A. No; to the largest per cent of the men employed it does not require as much. It takes two men to handle the machine. That requires the skilled men, but after that is done it requires unskilled men, because they only load the cars; because they only shoot it down, and what is required most is a man with a strong back who can shovel lots of coal. In fact, the introduction of machinery has compelled men to compete with machinery; to try and compete with the machinery.

Q. (By Mr. RATCHFORD.) The greatest skill in mining is acquired by the man who is an all-around man, who can mine the coal, prepare it also and send it out?—A. Yes; the most skill is required in mines where they have no machinery, where one man undercuts by hand and takes it down by hand and does everything.

Q. (By Mr. PHILLIPS.) How long does it require for a man to become efficient as a coal miner?—A. It depends to a great degree on how soon a man can adapt himself to it, but I would say that to become an efficient miner it would require an apprenticeship of three years and more for a boy, but for a man to become really skilled would require three years.

Q. You really have skilled and unskilled men?—A. We do not regard them so, because they go in with the skilled men and get the same wages. I will say that the law-making bodies of the States are recognizing as necessary the improvement of the mines by requiring competent miners. The State of Illinois has enacted a law that before a man can have charge of a room in a mine he must have served two years in the mine. That is recognizing the competency of the miners.

Q. (By Mr. A. L. HARRIS.) That is for the safety of the miners?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Are there not some veins in which these machines will not work to advantage?—A. Yes; the veins where there is an extremely bad roof overhead; they can not be worked to the same advantage there, or veins that are so low that they can not get them in. If a vein is less than 2 feet in thickness they can not work.

Q. Do you think they will be used to a larger extent from year to year?—A. Yes; they are increasing each year.

Q. (By Mr. RATCHFORD.) Has your association ever taken any action or placed itself on record as to the question of machinery? Do your members look with favor on the machine or disfavor?—A. I desire to qualify my answer to that. I will say that generally our membership looks upon the machine as an innovation that is going to displace their labor and from which they receive no part of the benefit. They are not opposed to the introduction of machinery in the sense that they oppose improved methods. They certainly recognize the age in which they live and understand that machinery has come and come to stay; but they do oppose the introduction of machinery to displace men, that makes them become tramps on the public highways; they oppose it from that standpoint. The introduction of machinery is destroying the skilled workmen, and is causing the introduction of men into the mines who are not skilled, who can only shovel coal. We have rates for machine and hand mining. For illustration, in the State of Ohio the price for machine mining is three-fifths the price of hand mining, and in the State of Indiana it is three-fourths. If mining by hand is 40 cents, mining by machinery is 30 cents. We recognize this always, believing them not to be fair. It is our opinion that the difference between machine mining and pick mining ought not to be as great. We are opposed to the introduction of mining machinery for the reason that the men have to compete with the machine; we must dig coal as cheap as the machine; we must dig coal by hand as cheap as the machine will dig it, allowing for the cost of the machine.

Q. (By Mr. A. L. HARRIS.) Is the present surplus of miners accounted for partly by the machines now in use?—A. To some extent, yes.

Q. (By Mr. RATCHFORD.) What has the introduction of substitutes for fuel to do with that question, creating surplus labor?—A. It has had an influence. The influence or effect of gas and oil has displaced coal in the markets to some extent.

Q. (By Mr. C. J. HARRIS.) Is there any difference in price according to the thickness of the veins also in which your machine works, according to the thickness of the coal veins?—A. No; the price of the mining is not regulated by the thickness of the coal vein. I will say that we would have no objection to the

regulation, but our price of mining is regulated by the ability of an operator to sell his coal in the markets to a very large degree.

Q. (By Mr. PHILLIPS.) Is the waste not greater in machine mining than hand mining?—A. No.

Q. Is there not a difference in the character of the coal mined by the machine as compared with that mined by hand?—A. Where miners shot coal out of the solid, where coal was shot before it was undercut by the miner, it made a larger per cent of the screenings or of waste coal than it does now; machinery undercuts that coal.

Q. But when it was undercut by the miner?—A. Fully as large a quantity of good coal then. And where it was undercut by the miner the grade of coal was fully as good, if not better, than that undercut by machinery.

There has been a great and increasing desire or demand among the laboring people for the enactment of employers' liability laws. In England they have an employers' liability act, and it has done very much to reduce the per cent of fatal accidents. I desire to say that in coal mining, for every 277,200 tons of coal that is hoisted there is a man killed; for that same amount there are at least a dozen men injured who suffer severe injuries. That is often the fault of mine owners. When you consider that it means 3 men brought up dead out of the coal mine nearly daily, it certainly leads us to believe that some legislation ought to be enacted to make conditions of mining such that there would be more safety than there is now. The mining laws of Great Britain, of course, are much more strict than they are here, and there are very few fatal accidents there any more, although their mines are full of dangerous gases. We have also mines that are dangerously full of gases and the mining laws are not at all stringent enough. They do not afford sufficient protection. If we had an employers' liability law it would do a great deal to reduce to a minimum the awful catastrophes that have startled the country from time to time in coal mines.

Q. (By Mr. A. L. HARRIS.) What State has the best employers' liability act?—A. I am not aware of an employers' liability act in any of the mining States.

Q. Pertaining to miners, what State has the best law in regard to inspection of mines, in regard to safety?—A. On the whole, I will say that the State of Ohio has the best mining laws. I think Illinois, after the adjournment of this legislature will have the most comprehensive mining laws, because they are revising the entire law.

Q. (By Mr. RATCHFORD.) What is the sanitary condition of the mining villages generally?—A. Very undesirable, very much so; as are the mines. I will say that the mines under the most favorable conditions, under the most stringent laws—that I know of no State that has a law that requires that less than 100 men breathe the same air before it is returned to the escape shaft. By that I mean that when the air is forced into the mine it is supplied into different sections and driven around the mine, but no place does the law require that less than 100 men shall use that air before it is returned to the escape shaft out of the mine, and that is regarded as a strict law. That is not a sufficiency of ventilation.

Q. Does this air that passes around the mines to the working places of each 100 men pass through air ways that are polluted with a refuse excrement of both men and animals?—A. Yes.

Q. Do you not think that proper places should be provided in each mine for such purposes?—A. Yes; that would do much to remedy the evil and would provide pure air for the men employed.

Q. What have you to say as to personal safety laws?—A. In some of the States they have very fair safety laws, such as requiring that cages running up and down, hoisting the men up and down, have safety catches and all of that, everything of that kind. In others they are not as good. In fact, it would be much better for the miners were uniform laws enacted so that it would be exactly the same in one State as another.

Q. (By Mr. RATCHFORD.) Have you any suggestions to offer to the commission as to remedial legislation, or upon any other subject in relation to the testimony offered?—A. Nothing more than to say that while the people whom I represent desire very much the improvement of our laws for the protection of the workmen, it has been my own experience that if laws were enacted that would permit laboring men to join trade-unions without intimidation, without even the suggestion of influence on the part of their employers, we could do much to change conditions so as to make them more desirable.

Q. (By Mr. KENNEDY.) Do you not believe that there is more hope for the workman through his own efforts in his labor organizations and working upon public sentiment than there is in anything that he can get from the legislatures in that respect?—A. I think that under existing circumstances there should be

protectory legislation for the workingman; ordinarily I would agree to that. The laboring people feel, as there has been so much legislation that has favored corporations, that they ought to be given protection by the law. They are the weak element now. The moneyed class, the corporations, have grown to such vast magnitude, they have become so powerful and strong that the employees are no longer able to combat them. They have become so powerful that the employees feel that they are the weaker and are equally entitled to protection from the Government; that at least laws should be enacted that would not permit men to be driven from place to place because they desire to join trade-unions.

Q. (By Mr. RATCHFORD.) As a last analysis of this whole question, I would like to have you state to the commission, as nearly as possible if you have not the exact figures, what are the average annual wages made by the miners that you represent after all expenses are deducted?—A. Speaking for the bituminous miners only, with whom I am most familiar, last year the total annual production was 159,609,898 tons of coal. Figuring that on the basis of 50 cents a ton, it would make a total of \$79,809,949. This sum divided by the number of miners, 248,000, those engaged in bituminous mines, would make a total of less than \$1.03 per day. From this amount must be deducted mine expenses, house rent, etc.

Q. My question implies that nothing shall be deducted from the gross earnings except the money expended for mine supplies, powder, oil, fixed charges.—A. The average expenditure of money by the miner for mine supplies, his powder and sharpening his picks, and mine supplies he must buy, etc., would be on the average 15 cents per day.

Q. (By Mr. CONGER.) Do I understand that that \$1.03 per day is for all the work days in the year or the number of days employed?—A. On the basis of 306 days.

Q. The working days in the year?—A. Yes.

Q. On your basis that you mentioned this forenoon, that the miners were employed about two-thirds of the time, the actual rate of wages would probably be about \$1.50 for the time employed.—A. I want to make this qualification, however; take the Western miners, men employed in the Far West; their wages are in this average. As their wages are very much higher than those paid in the central States, it raises the average of those employed here. They get as high as \$3 a ton for mining coal in some places out there, so you will readily understand it does not make a fair estimate.

Q. (By Mr. NORTH.) Do you think it is fair to aggregate wages and divide it into the total number of possible employees irrespective of the question whether they were working or not, in order to get the average?—A. I think so.

Q. (By Mr. CONGER.) The figures that you quote were for what year?—A. 1898.

Q. How did you obtain the number of employees who were engaged in mining for that year?—A. We took the number of employees from the 1897 report of the Coal Trade Journal. It gives the number of men employed in each of the mines in the different mining districts.

Q. (By Mr. NORTH.) That includes all of them that died during the year, does it not?—A. I do not know whether it does or not.

Q. My proposition is that while it may do for a general statement yet it is not a scientific average.—A. Let me say that estimating the average price per ton at 50 cents—that is a high average, that is an extremely high average, because the largest part of the coal that is mined is mined for less than 50 cents a ton. In fact, in the four States, Pennsylvania, Ohio, Indiana, and Illinois, much of the coal is mined by machinery, and that is all mined at a price much less than 50 cents a ton.

Q. You think that is a fair offset to my criticism?—A. Yes; I think if that average were looked over carefully it would not amount to 50 cents.

Q. (By Mr. SMYTH.) Taking it that way, a man working 10 days during the year as an employee would accomplish as much as though he were working 50 days; therefore it would raise the number of employees and lessen the average, while he may not have worked over 10 days?—A. Ordinarily the miners are engaged steadily in the mines. I think that would make very little difference to it.

Q. (By Mr. NORTH.) Will you state to the commission that the average earnings of those employed in the mining districts that you alluded to do not exceed \$1.03 a day, including the necessary mining expenses?—A. I will state that when we compiled those figures ourselves I was agreeably surprised to find that it was as high as \$1.03; that my experience has been that miners do not earn that much on an average. We have figured on this every year, and this year we were congratulating ourselves that our organization had done something to secure better wages for the miners when we found it as high as \$1.03. A few years ago we

made a careful investigation to get as reliable data as it was possible to get and discovered they were earning \$0.87 a day.

Q. By this same process?—A. Not by this coal report, but by taking the average statement of the men who were drawing pay, and that was the result at that time.

STATE OF INDIANA, *County of Marion*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

JOHN MITCHELL.

Sworn and subscribed before me this 12th day of July, 1898.

JAMES STEVENSON, *Notary Public*.

My commission expires August 4, 1901.

WASHINGTON, D. C., *April 12, 1899.*

TESTIMONY OF EDWARD McKAY,

Member of the National Executive Board, United Mine Workers of America.

The commission met at 10.10 a. m., Vice-Chairman Phillips presiding. Mr. Edward McKay, of Buenavista, Pa., testified. The topical plan of inquiry on mining was followed in the examination of the witness.

Q. (By Mr. RATCHFORD.) Please state your connection with the miners' association.—A. I am a member of the national executive board, United Mine Workers of America.

Q. How long have you been connected with your organization in that capacity?—A. This is the second year. Prior to that time I held different positions for the last 17 years.

Q. Are you a practical miner?—A. Generally considered so; yes.

Q. As a member of this executive board, are your operations confined to your home district?—A. Largely so. There are times when it takes me out into other sections.

Q. Is the same true of other members of the board?—A. Yes.

Q. How many is this board composed of?—A. Eight members of the board, the president, vice-president, secretary and treasurer, making eleven in all.

Q. Are they working for the association all the time?—A. Yes; looking after the interests of the miners of this country.

Q. In case of strikes, discriminations, etc., are those eight members concentrated in the striking districts very often?—A. Yes; those eight members favor arbitration and conciliation in settling satisfactorily any grievance that may arise in any section of the country.

Q. Have you any benefit features in your organization of a permanent character?—A. Not in a general way. There are various localities that have established benefit features in their local organizations.

Q. As to the growth of the trade union, is it growing or is it falling off in membership?—A. It is growing very rapidly. I think in 1897 we had about 16,000 members; to-day the membership will range from about 75,000 to 80,000 members.

Q. What has been the effect of the increased membership upon wages and conditions of mining during that time?—A. Wages have advanced, hours of labor have been reduced, and there is a general marked improvement in the coal trade. The reduction in hours is one-fifth, from 10 to 8 hours per day; the general advance in mining rates is in the neighborhood of 20 per cent.

Q. Have you any affiliations with any other trade?—A. Yes; we are affiliated with the American Federation of Labor; that is the only one.

Q. Have you any connection with the Knights of Labor?—A. Very, very slightly, if any. There may be one or two assemblies of the Knights of Labor that are also members of our organization, but not more than one or two.

Q. Is the organization of the Knights of Labor losing or gaining strength among the miners?—A. It is losing; in fact, it is entirely gone among the miners.

Q. What reasons do you assign for that?—A. Taking my own views of it, I claim the Knights of Labor was never adapted to protect the miners' interests as well as our present organization is. In the first place, the constitution was so arranged that we had to comply with it before a strike could be declared, and

many times before the wheels of machinery could be put in operation the opportunity was gone for a successful strike in our business. That was one of the reasons that affected the miners of western Pennsylvania.

Q. The business methods of your organization differ from the Knights of Labor in that respect?—A. Yes.

Q. Do they differ in any other respect?—A. I do not think that they do very materially.

Q. Were the methods adopted by the Knights of Labor in the transaction of their ordinary business methods of strict secrecy?—A. Yes.

Q. Have you any secrecy in your organization?—A. Not any whatever. In holding our meetings there is nothing we keep secret.

Q. Is the public usually invited to attend your meetings?—A. No.

Q. Are they ever forbidden?—A. Yes; at times they are forbidden; but it is at very rare times, when we are considering matters pertaining to the craft solely.

Q. But when holding meetings for organization purposes, for instance?—A. Open meetings.

Q. Have you noticed in your experience whether the employers favor an open organization more than the secret?—A. An open organization.

Q. Do you believe that an open organization is the most conducive to the interests of the workers as a whole?—A. Yes.

Q. As to incorporation of trade unions—are you incorporated under the laws of the State?—A. No; I think not.

Q. Have you anything to say as to the feasibility of incorporating trade unions?—A. No; that is a matter I have not given much study—whether it is advantageous for our organization or not.

Q. "Relations to nonunion labor and the right to liberty of contract." Have you anything to say under that topic?—A. Our practice is to go and see those people, talk with them, try to reason with them, and show them the advantages of being organized.

Q. In case they refuse to organize, what methods are used?—A. Generally, none. In odd cases, where we are strictly organized in a sense with the exception of one or two mines, we ask that those unorganized men join the organization, and sometimes seek to force them to be members or not be allowed to work there.

Q. Are there any restrictions or influences exercised, on the other, hand by employers to prevent them from joining these organizations?—A. Yes; in many cases employers will discharge a man if they know he joins an organization.

Q. In case of strikes, either for advance in wages or reduction of wages, or for any other cause, what is the position of nonunion labor toward organized labor in your trade?—A. Generally speaking, unorganized labor in time of a strike joins with the organized miner.

Q. You spoke of having a strike within the past 2 years. To what extent, if any, did the unorganized miner respond to that strike order?—A. Well, the fact that the membership increased from 16,000 to 80,000, in round numbers, shows that the miner is appreciative of the move of the organization, and being benefited so much they believe and see that it is to their interest to take hold of it.

Q. You said you had 16,000 men in 1897. Was that at the beginning of the strike?—A. Yes.

Q. How many miners were there on the strike?—A. 150,000 or 200,000.

Q. What have you to say as to the right of liberty of contract; do you believe that right should be granted to each individual, or do you believe that liberty of contract should imply collective bargaining?—A. My opinion is that the right to liberty of contract should be given to all men, providing that contract did not interfere with the liberties of others.

Q. Does your organization make contracts with organizations of employers?—A. Yes; we are in the habit of making agreements yearly. At the present time we are working under agreements signed mutually by the operators' and miners' representatives.

Q. Is it found advantageous to both parties to confer with each other and make those agreements?—A. Yes.

Q. What is the tendency of these agreements with respect to strikes; do they curtail the number of strikes?—A. Yes; the tendency is to lessen the number of strikes and bring around more harmonious relations between the employer and employee.

Q. (By Mr. PHILLIPS.) How were contracts made prior to your organization between employer and employee, or were there any?—A. Previous to the organization adopting this policy each section looked after its own interest—each competitive district—and when there was a strike going on in one district another

district was largely benefited, so at times we have had, for instance, in the Pittsburgh district, a conflicting condition; we have seen river miners strike for higher prices, when it would be impossible for the railroad interests to be on a strike at that time, and they would be benefited largely; one place at one price and another place at another price; and generally the conditions were unsettled.

Q. (By Mr. RATCHFORD.) Speaking of the Pittsburgh district, have you had unusual mining troubles there in the past few years?—A. Yes.

Q. Please state the main causes that led up to these troubles as fully as you wish to.—A. The causes of the troubles have been the lack of a thorough understanding as to market conditions by the miners, and the desire on the part of the operators to run the business as best suited themselves, regardless of the interests of the miners. Two parties having variously differing views caused this friction and trouble.

Q. Does that statement apply to the majority of the operators?—A. Yes; in the past. At present there are better relations and a better understanding between miners and operators; still that trouble is very plain to-day on the part of some of them.

Q. Do the operators of the Pittsburgh district as a whole treat with your organization?—A. Yes; as a whole.

Q. Including what is known as the New York and Cleveland Gas and Coal Company?—A. No; that company does not treat with the organization.

Q. Please state what the actions of this company have been in many important regards as against the organization of miners within the past 4 or 5 years?—A. The actions of this particular company have given the miners' organization considerable trouble. It has positively refused to treat with the organization; it has made a rate of its own regardless of the district prices.

Q. Was that rate higher or lower?—A. Lower.

Q. How much, usually?—A. Five cents per ton, usually. At the present time it is 12 cents per ton.

Q. Has it ever been more than 12 cents?—A. Well, the conditions are such that we can not find out. I believe sometimes it has been higher. When it first took advantage of 5 cents a ton, it claimed it through the right of having no company store; that they paid in cash, and that 5 cents a ton was about equal to the percentage that other companies got from the store goods. As they saw it gave them an advantage they increased it to 10 cents, and now it is 12 cents. They have the mines fenced in, and on two or three occasions I have gone into the neighborhood, and some of the company officials, as soon as I got on the ground, were right in after me. If I went through with a rig, they would have one of the best-spirited teams they could get and follow me through and tell me to get off the premises. In 1897 we entered and had to distribute newspapers to put our position before the miners. There were 2 teams. Their men followed us around and would not let our team stop to distribute the newspapers.

Q. (By Mr. PHILLIPS.) On the public roads?—A. Yes.

Q. How many mines are operated by this company you speak of?—A. Three.

Q. How many men are there employed?—A. In the neighborhood of a thousand men.

Q. (By Mr. RATCHFORD.) And their annual production?—A. There would be in the neighborhood of 2,000 tons a day coming from their mines; more than that.

Q. It is suggested that you name the stockholders of this company, if you are in a position to do so.—A. I can not name the stockholders, with the exception of the general manager, W. J. De Armitt. W. P. De Armitt and Thomas De Armitt are two of the directors.

Q. Is Mr. De Armitt not president of the company?—A. Yes.

Q. Is it not pretty generally known that stockholders of this company are largely eastern men—New York men, for instance?—A. Really, that I can not tell.

Q. Has this company no union men employed?—A. None. If one is a union man, he is discharged the moment they know of it.

Q. This company claimed that as it had no stores and paid in cash it was justified in the payment of a lower wage to its miners?—A. Yes.

Q. What truth, if any, was there in that claim?—A. I am willing to admit that the company store is an evil. It did place the company operating the store at an advantage over those who did not have a store, but just how much, depends upon the interest and good will of the company. There are some company stores to-day that charge 100 per cent upon their sales of some articles, and others not so much.

Q. (By Mr. PHILLIPS.) How much, on the average, would they charge over those running independent stores in that section?—A. It is pretty hard to tell that. I just saw an instance this last week where one of our members said he paid \$2.25

for a keg of powder; the same powder can be bought at individual stores for \$1 a keg.

Q. Such prices as that do not prevail through the whole region?—A. No; I can not tell you just what per cent they overcharge.

Q. (By Mr. RATCHFORD.) Has Mr. De Armitt, of whom you spoke, at any time proposed to pay the union scale of wages, providing his competitors were put upon the same basis as himself in regard to cash payments?—A. Yes.

Q. What was the action of the operators' and miners' associations in this respect?—A. In 1896 Mr. De Armitt proposed to the miners that he would pay the union prices, providing there were cash payments, uniform screens, and 2,000 pounds to the ton. The miners and operators undertook to establish that throughout the region, and it was pretty generally established. I think in the neighborhood of 95 per cent of the mines of the district have come to this standard that Mr. De Armitt demanded, and 97 per cent of the total tonnage did establish those conditions.

Q. Did operators close their stores?—A. Yes.

Q. And miners accepted 5 per cent less for cash payments?—A. Yes; and established those conditions. When Mr. De Armitt saw the report he disputed it, went out and made a report for himself, and justified his acts by saying, "I want to protect myself from those conditions."

Q. (By Mr. C. J. HARRIS.) After the year 1897 were they pretty generally out of existence in the Pennsylvania district?—A. I am sorry to say that since the beginning of last year they have come pretty generally into operation again, and the system is as bad now as ever it was in the Pittsburg district.

Q. (By Mr. RATCHFORD.) The proposition that was so fully complied with ultimately failed?—A. Failed; yes.

Q. Did prices decline, advance, or remain as they were?—A. At this time we were getting 70 cents per ton, and from the failure of that agreement prices declined until the majority of the miners were getting 54 cents per ton, and some of them less than that. Pretty nearly every mine made prices for itself for a little while.

Q. The majority of the mines of the district came down from 70 cents to 54 cents or less?—A. Or less; yes. There were, I think, ten or twelve companies which staid with the organization and paid 60 cents, and the miners themselves volunteered to come down.

Q. How were the minority of the operators of that district able to meet such competition?—A. The operators who were willing to treat with the organization deplored the condition of affairs and tried to have meetings and bring around peace, but it was impossible, and therefore the miners, in order to put them on an equal footing, came down to meet De Armitt's conditions—the New York and Cleveland Gas Coal Company.

Q. That 'ed to a reduction throughout the whole district?—A. Yes.

Q. Did it extend to any other place?—A. Yes; in the Hocking Valley there was quite an agitation.

Q. Do we understand the reduction was not satisfactory in the Hocking Valley in Ohio?—A. Yes; I think not.

Q. Tracing that fall in mining prices from the beginning of the agitation until the bottom was reached, are we to infer from what you said that this one company, to which you refer, was largely, if not wholly responsible?—A. They were wholly responsible.

Q. Could you explain how it was possible for any one mining company operating but three mines and employing but 1,000 men, to bring about a reduction in prices in two districts, affecting about 45,000 men?—A. Yes. The capacity of the Pittsburg district to produce coal is so much larger than the consumption, than any small operator, and in fact, without a proposition from the operator, the consumer largely quotes the prices; if Mr. De Armitt quotes a figure, all other competitors are asked to meet that cut or they do not get the trade. Sometimes they do not get it even after they meet the figures. One operator, by making a small rate, establishes that rate, and every other operator has to follow that or else he does not get the trade.

Q. (By Mr. PHILLIPS.) You do not mean by that that one operator cutting prices can govern the market and supply the trade?—A. Yes; the moment the consumer finds out that one company is shipping coal at so much less per ton than another, that operator is asked to meet those figures, and in order to secure and maintain the trade, he has to meet those figures or else it is given to someone that will cut the rate.

Q. (By Mr. SMYTH.) That one man can not supply all the trade?—A. No; if there was a mutual understanding between the balance of the operators not to

cut the rate, but in the scramble for trade they have to meet those figures or else do not have the business.

Q. Would the miners be willing to accept a reduction to be paid on the cash basis and abolish the company stores?—A. Yes; we did that.

Q. Would the miners generally be willing, for the sake of getting cash and abolishing company stores, to accept a less price for mining?—A. No; I think we have experienced that; we have actually suffered a reduction and gotten the stores back again.

Q. Then you would rather have the stores and be paid the price?—A. We hope and pray that the stores will be legislated out of existence—that no company will be permitted to run a store.

Q. This New York and Cleveland Company you speak of; have they any store now, or do they still pay cash?—A. Yes.

Q. (By Mr. RATCHFORD.) During this contention in your district, what were the relations of this company to other companies in the district in a business sense? Were they antagonistic to other companies in meeting them in competition?—A. In a business sense, I think they were friendly.

Q. Would they take trade that belonged to others?—A. Yes.

Q. In view of their large production and their greed to extend their markets, as we understand from your statement, is it not possible that through the cutting of prices, as a result of cheaper labor, this company might make prices for a great deal of coal in excess of the amount they themselves were able to produce?—A. Yes. If a company comes out and cuts a rate on the lakes, these rates are given long before the coal is shipped. The moment that the New York, or any other company that has any advantage, gives a low rate in order to get the whole of the coal sold, other companies have to meet these rates or wait on the trade. If there is an understanding between the balance that they will not follow this company, then, of course, the trade is all right, but men, in haste to place their orders, shave prices as closely as possible, and consequently all of them put their coal in at cheap rates and it affects the markets.

Q. (By Mr. NORTH.) Do you favor a combination among the mine operators of the country in the nature of a trust?—A. No.

Q. Do you think it would be for the interest of the miners if such a combination were formed for the purpose of keeping up the price of coal to a certain fixed figure?—A. I answer no, by saying that the same purpose could be accomplished in a different way.

Q. (By Mr. PHILLIPS.) Will you please state in what way?—A. By organization, mutual organization, imbued with fairness and honesty. Let the trade take care of itself. I believe that the law of supply and demand ought to cover the trade largely.

Q. (By Mr. NORTH.) Does it not cover it now?—A. In a way.

Q. And it is the operation of the law of supply and demand that you are complaining about and its effect on wages of miners?—A. No; I am complaining of the unjust methods that are put in operation—the fact that this company clothes itself with the right to work its men 2 hours a day longer, and for 12 cents per ton less tonnage rate, and some 10 or 15 cents per day for day labor.

Q. Are they driven into taking that by excessive competition?—A. No; they are the leading competitors, forcing their own rates on the markets.

Q. (By Mr. CONGER.) Do you not think that if the price of coal to the consumer is increased that the operators would be willing and able to pay greater wages to the miners?—A. No; this particular company, I think not. It shows a disposition to govern the trade without the enforcement of any law.

Q. The facts are that the present low rate of wages to the miners is the result of supply and demand, because the capacity of the mines and number of miners are more than sufficient to supply the country with what is needed for consumption?—A. Yes.

Q. (By Mr. FARQUHAR.) Instead of making a monopoly of the coal trade, you would have the operators come together with the employees and discuss a fair scale, and agree as nearly as possible, for the benefit of the operator, of his own capital, safety of his company, and for the benefit of the employee in getting a fair wage?—A. Yes.

Q. (By Mr. SMYTH.) As a matter of fact, are not the labor organizations in the nature of trusts?—A. No; because they have not the elements; they do not desire the elements. A labor organization is formed upon the basis of mutual agreement. Our organization is formed for the purpose of arbitration and conciliation.

Q. But are not the details of the organization so that a few men, the officers of your organization, might arrange for the prices for the entire body of coal miners?—A. Yes.

Q. Is not that in the nature of a labor trust?—A. No; not in the nature of a trust, as I take it.

Q. (By Mr. FARQUHAR.) Are not the men that you send to these conferences of operators and miners, delegates from a body, properly elected?—A. Yes.

Q. Do you think the Representatives in Congress are a trust because they are representatives of each Congressional district?—A. They ought not to be.

Q. (By Mr. RATCHFORD.) Do you think a labor organization is more of a trust than a political one?—A. Not nearly so much.

Q. As to supply and demand regulating wages, wherein does supply and demand in the coal industry differ to-day from what it was 2 years ago, when prices were so much lower and the hours of labor so much longer; was there any material difference?—A. No; not any material difference. Both supply and demand have largely increased during the last 2 years, and prices are better.

Q. How about supply and demand of labor; you are speaking of the product?—A. Yes. The supply and demand of labor has not materially changed at all.

Q. (By Mr. PHILLIPS.) There is certainly more demand now for labor than there was?—A. There is more demand for labor, yes.

Q. (By Mr. RATCHFORD.) In your opinion, would the consumption and production of coal be increased from the mines of our country by a cheaper mining rate?—A. No, if we take the conditions of the country. If we would go into other markets of the world, yes; but for our consumption, no.

Q. Speaking of our own country, any advance or decline in price, so long as those prices are within reason, would not materially affect the production and consumption of coal?—A. No.

Q. What is the greatest factor in regulating those prices, and what part do the organizations of both employers and employees play in that connection?—A. A low market naturally brings low prices; a rising market brings rising prices. The organization plays the part of mediator and asks that justice be done; and whenever the market shows that a reduction should take place the organization sees that the reduction is made, doing justice to the market, and, vice versa, in getting an advance on a rising market.

Q. The coal trade could be best stimulated by an association of the employers and employees, treating mutually and voluntarily together, and holding selling prices up to reasonable rates?—A. Yes, I think that the best interests of the coal trade could be solved by a general union of both miners and operators, in respect of organizations meeting mutually for the protection of the industry.

Q. What have you to say of unskilled labor, organized or unorganized?—A. Unskilled labor, to my mind, stands the same as skilled labor, and all labor should be organized for its mutual protection.

Q. Is there a class of men in the mines, generally speaking, known as unskilled men, or are you bothered as much in that connection as the other trades?—A. No; we are not. Generally speaking, a man that can go into the mine and do any of the daily labor that is to be done in and around the mine, can go into the coal face and dig coal. It is seldom that a man is employed in and around the mines—in the mines particularly—that is not a practical man.

Q. (By Mr. PHILLIPS.) How long does it require a man to be what you call a practical miner in the mining of coal to advantage?—A. There are some men who can adapt themselves after they come to maturity. To my mind the practical man is the man who has been raised from boyhood up in the mine—that is, through the different processes that are to be met with in the mine.

Q. Could he not learn to mine coal to advantage in 2, 3, or 4 years, as other trades are learned?—A. He may be able to mine coal in 2 weeks. Take that man out of that vein and put him in another vein, and he would have to learn it all over again; and other work in and around the mine he would not be able to do through the lack of experience.

Q. (By Mr. RATCHFORD.) Enumeration of the several causes leading up to strikes. What can you say to the commission on that subject?—A. I think that what we have said in regard to the position taken by the New York and Cleveland Gas Coal Company and others led up to our 1897 strike. The conditions that we, together with others, were under made living unbearable. Men will only strike when they see they have a good reason for it; when they are forced into it. We were forced to have that 1897 strike. At the mining rate that prevailed we could not live; we could not meet the demands that came against us. When conditions get so, men get dissatisfied, and then decide to strike rather than work under those conditions. That was the state of affairs in 1897 when the last general suspension took place among the miners.

Q. Are the miners, in your judgment, more ready to strike than other tradesmen?—A. No.

Q. Why is it that mining strikes occur so often? Is it because of the natural desire of miners to enter upon strikes, or is it because of some peculiar conditions of their trade?—A. It is on account of some peculiar conditions of the trade. We have more strikes where miners are unorganized than we have where they are organized.

Q. What are those peculiar conditions?—A. Where the employers seek to make a change of any kind it naturally arouses suspicion in the minds of the men, and custom has shown us that when changes are asked by the employers of some kind it is generally for the advantage of the company. Strikes will take place by the companies demanding changes.

Q. What have the screens or weighing of coal, for instance, to do with giving rise to strikes?—A. The screens have a great deal to do with trouble at times. A screen that will be put up to-day, fixed up according to specifications, may get out of gear, may get out of shape. The company may raise it a little—raise the elevation so that the coal will not go over it; sometimes the bars get loose; sometimes they get old and worn. When they get old they will spread, and all these intricacies in the screen give trouble back and forth.

Q. The weighing of coal?—A. It is quite a thing to find out the intricacies of some of the scales, and the weighing of coal has certainly caused us a lot of trouble, and we have mines to-day where, generally speaking, the miners will tell you they do not get any weight at all; they know they are robbed; and yet to learn how they are robbed and where they are robbed is the great mystery.

Q. You have inspectors, have you not, provided by the State, to examine those scales, etc.?—A. The screen law was declared unconstitutional by the supreme court of Pennsylvania, which took the right away from the mine inspector to examine the screen. I think it was in the Steen case, wherein the man had been arrested for false weights, tried in the courts, and was sentenced. He appealed to the higher court. The higher court declared the law unconstitutional.

Q. As to docking of weight for impurities, is this not also a cause of strikes very frequently?—A. Yes. The system is applied at mines where the miners are supposed to accept it. There were lots of mines in the Pittsburgh district that it was not tried on at all. I have seen notices go up at mines saying that any miner sending out dirty coal will be docked ten hundred, and for the second offense will be discharged. They would invariably rather dock than discharge, and as a result miners suffer from that.

Q. And in case of discharge do the miners sometimes strike to have the man who is discharged retained?—A. Yes.

Q. I understand that the legislature of your State some two years ago sent an investigating committee into the mining regions to make inquiry as to the condition of the miners. Have you any information to give regarding that investigation?—A. Yes; they made a report. I expect you could get a copy of it in Harrisburg. That commission reported in Harrisburg that the conditions of the miners were deplorable. It was a surprise to themselves, and they did not think that it was possible for such a state of affairs to have existed as long as it had in and around Banning.

Q. Did they treat the question of screens, stores, and other irregularities that might be found in the district in their report?—A. Yes. In Banning they examined the screen of H. K. Wick. They found the screen to be 80 superficial feet, inch and three-quarter, diamond bar, when the ordinary screen of the Pittsburgh district was 60 superficial feet, inch and a half, flat bar.

Q. In making the investigation did they take testimony from miners and operators alike, giving each side a fair opportunity to present their case?—A. Yes.

Q. What have you to say as to the economic results of strikes and lockouts to the workers, employers, and the community at large?—A. Taking the progress that this country has made during the last 20 or 25 years, notwithstanding the number of strikes and lockouts we have had, they have been a blessing to the country.

Q. Do you believe that the workers are the beneficiaries of those strikes?—A. I believe that both parties are benefited largely by them, that is, as far as it has gone. For the time being both parties suffer.

Q. Do you believe there is, or is not, a wrong inflicted on the great third party who has no direct connection with it, the community at large?—A. In some instances, yes; in an indirect way they are benefited.

Q. (By Mr. SMYTH.) Often strikes are caused for the purpose of reducing the production of coal, are they not, and in that way relieving the market and getting an advance for coal, and thus enabling the miners to get a better price for mining?—A. Not often.

Q. Has it not been done?—A. I do not know that it has.

Q. (By Mr. C. J. HARRIS.) Are strikes ever inaugurated for unreasonable and trivial causes on the part of organized labor simply to show their authority, the power they have?—A. I do not know of an instance where such an experiment would be tried.

Q. Do you not sometimes inaugurate strikes where the matter is itself immaterial, but as a matter of principle, to show that your organizations must be implicitly obeyed in their demands?—A. No. It has been my policy in life, generally, to have good reason. I never wished to inaugurate or see a strike inaugurated where the question at issue was not of vast importance to the interests concerned.

Q. But you would advise your organization to strike simply to assert its authority, would you not, if there was a principle involved?—A. Not to assert our authority. If the question at issue was of sufficient importance to the interests concerned I would advise a strike.

Q. (By Mr. RATCHFORD.) Is it, or is it not, a fact that if it were not for the ability of workingmen to strike, and the fear on the part of the employer that a strike might be inaugurated, that joint agreements would be rendered impossible?—A. It is a fact.

Q. You believe, then, that the strike has done so much in bringing the employer and employee closer together?—A. Yes; I am fully satisfied that it is the power of the workingmen combined that has alleviated his position from what he was in the early part of this century to the present time.

Q. What are your methods of strikes?—A. Our methods of strikes, when a strike takes place with the organization, is for us to seek to have the unanimous support of the whole of the miners. In some instances men disregard the orders to strike and continue to work. In such cases we try to influence those men to come out with us, showing them wherein they are injuring us by continuing to work and dividing our force.

Q. Is it a common principle, recognized by both employers and employees in the mining trade, in a belt of territory, composed of four or five States, which is known as the central competitive field, that a high price can not exist in one part of that field and a low price in another; that is to say, that the same relative price must exist in all parts of it?—A. Yes.

Q. That being the case, your organization is interested in maintaining that relative price at all times, as is the operators' association?—A. Yes.

Q. A small portion of that field, by working at a reduced price, if allowed to continue, will ultimately bring about a reduction in the whole field, will it not?—A. Yes.

Q. The boycott—does your organization resort to the boycott at any time?—A. Yes; not in the sense of a boycott; if it were possible for us to reduce the output of a company by appealing to organized labor not to patronize. That word boycott is a little strong.

Q. (By Mr. SMYTH.) You can not boycott the product, can you?—A. We can limit the output of a mine considerably for local purposes.

Q. Has your organization ever attempted to curtail in the market by means of the boycott the production of nonunion coal?—A. Yes; last year we attempted that as against the West Virginia cheap coal coming in there.

Q. Was it successful?—A. Partly so. It had its effect.

Q. (By Mr. RATCHFORD.) The blacklist, what have you to say regarding it?—A. The blacklist is one of those methods that is generally tried to be kept under the surface. Where a man is discharged and goes around from place to place and can not get any work, sometimes it is found out; as soon as they get his name, after working a day or two, he is discharged. To find out who did it is a hard matter. The laws of Pennsylvania give the men the right to prosecute, if you can find it out. It is practically impossible to find it out.

Q. You have no such terms in your organization, blacklisting your members?—A. No.

Q. (By Mr. SMYTH.) Do you ever blacklist the mine or operator?—A. No; but it is the blacklist that we get.

Q. Do you in turn ever blacklist a mine to prevent miners working there?—A. No; we have never attempted it.

Q. Picketing, patrolling, and other methods of influencing results, whether by employers or employees, and sympathetic strikes—any sympathetic strikes?—A. In some instances, yes. Last year, when the third-pool strike of the Monongahela River was going on, we asked the miners in the fourth pool, who were loading coal for the operators in the third pool who refused to pay scale rates, to not load any coal for those operators—practically a sympathetic strike.

Q. How about picketing?—A. We did some of that in 1897 at the New York and Cleveland Gas Coal Company's mines. When the miners persisted in working up there we went up and tried to intercept them in the morning; talked with them, and tried to induce them to stop.

Q. Any violence used in trying to prevent them from working?—A. None whatever.

Q. (By Mr. RATCHFORD.) The importation of new or foreign labor under contract or otherwise, operation of the law, etc.—what have you to say of them?—A. The importation of foreign labor is very disagreeable to us—new or foreign labor coming in to take the places of men who are striking. Most of our strikes—in fact, the whole of them—being based on fair and reasonable grounds, to see men brought in from other sections, and sometimes other countries, has a tendency to rile men and throw the country into trouble just at that particular time and place.

Q. Your organization is not opposed to the importation of those men when an employer finds it necessary in order to get the amount of labor he desires, is it?—A. No; if everything is right, certainly not. We do not object to a foreigner coming in or a new man from another field, providing there is work there for him.

Q. Providing the labor of that particular section is already employed, there is no trouble there?—A. Yes.

Q. What have you to say of the operation of the law forbidding contract labor?—A. We think that the law should be rigidly enforced—that no man should be brought into this country under contract.

Q. How about bringing a man from one State to another?—A. If it is an evil from one country to another, it is just as bad from one State to another.

Q. Conciliation, mediation, and arbitration, under State law or joint committees, temporary or permanent—what is the position of your organization on those questions?—A. Our organization is favorable to conciliation and arbitration, mutually, by joint committees.

Q. (By Mr. SMYTH.) By law or mutual agreement?—A. No; not by law. I do not believe that State or national law for compulsory arbitration would help matters any.

Q. (By Mr. RATCHFORD.) Has your organization ever expressed itself on that point?—A. Not to my knowledge.

Q. Are you opposed to the creation of State boards of conciliation and arbitration?—A. I have had no experience with them. I am very favorable, as far as I have seen them worked.

Q. Your organization would be favorable to them, you think?—A. Yes.

Q. As to the injunction in strikes, what have you to say?—A. Injunctions, as they have been dealt up to us by the courts of Allegheny County, have shaken the faith of the laboring people in the law—the right of the courts to issue an injunction prohibiting a man to work or go near a work because it displeases the employer.

Q. Have these injunctions been used as against the miners in any of their recent strikes?—A. Yes. I myself was enjoined two or three different times before going on or near the grounds of the New York and Cleveland Gas Coal Company's mine or property.

Q. Enjoined from committing some supposed crime, or enjoined from going on the property?—A. From going on the property or talking with the employees in or around that place.

Q. Did you contemplate destroying the property or committing any acts of violence?—A. Never. I was in that section for a couple of months, and there never was an act of violence while we were there. An injunction was served upon me before I had ever gotten to the place. It was an injunction restraining all the officers of the organization.

Q. This was during the strike of 1897?—A. Yes.

Q. Had you personal supervision of one of the miners' camps during that strike?—A. Yes.

Q. Is it, or not, correct that barrels of beer or barrels of whisky were sent there by some unknown parties, freight prepaid?—A. Yes; a barrel of liquor was sent to Turtle Creek.

Q. How many miners were in that camp?—A. We must have had 2,000 or 3,000 men some days.

Q. You have no knowledge as to who sent the liquor?—A. No.

Q. As the gentleman in charge of that camp, what was your action when that barrel of liquor was received?—A. I did not receive the barrel; did not see it. I heard of it being received at the station, and issued orders to ship it back; that we wanted no liquor about the place.

Q. (By Mr. SMYTH.) In whose name was it shipped?—A. I do not know who it

was shipped to. My information came from newspaper men, that there was a barrel of liquor at the station. I said, "You go back and have that barrel of liquor shipped away."

Q. (By Mr. RATCHFORD.) Where?—A. To wherever it was shipped from; that it would not be received.

Q. (By Mr. SMYTH.) Do I understand, then, that without your knowing to whom that barrel was shipped, you had the power to order it shipped back?—A. It was shipped, I understood, to the camp, and as I had charge of the camp, as soon as I was informed it was there I ordered it shipped back; to be returned; that we would not receive it.

Q. (By Mr. RATCHFORD.) What, in your opinion, could have prompted the shipping of that barrel of liquor by anybody?—A. If that barrel of liquor had been distributed among those men it would have been a very easy matter for the enemy to come into the camp, if he wished to, and pick a quarrel, and lead the men on to do something that would not be tolerated, and would not be done without liquor.

Q. Incite acts of lawlessness?—A. Yes.

Q. Have any of the officers or agents of your organization at any time been arrested for violations of injunctions, to your knowledge, under contempt of court?—A. Yes; I think they have; some of our members.

Q. What was the penalty; do you remember?—A. I think they were all finally settled up in court by paying the costs. There have not been any of the officers, to my knowledge, arrested for contempt of court, while all of them, I think, have been served with injunctions—more or less of them.

Q. The injunction is not regarded by your organization as a fair means employed in influencing results during strikes?—A. No; it is one of the means they take to intimidate the miners and their officers as against any further prosecution of the strike.

Q. As to the wages and methods of payment, what have you to say?—A. I fully believe that a weekly pay should be made in cash. It would largely put the miner in position to keep away from a company store. The evil of the company store would be abolished.

Q. (By Mr. SMYTH.) Have you any sliding scale in the coal mines?—A. No.

Q. Would it not be practicable?—A. Yes; I suppose it would.

Q. It is adopted in other countries, I believe; is it not?—A. Yes.

Q. (By Mr. RATCHFORD.) To what extent does the practice exist of issuing store orders in the mining districts?—A. To a very great extent. Where the company stores exist the miner has to go to the company office and he gets a coupon or store order book, sometimes like one of these monthly passes on a railroad. Different companies have different methods of doing it. They punch until every figure is gone, and they remain there as a relic. They will tear the coupons out amounting to the purchase, and so on.

Q. Is this custom practiced generally in the mining districts, so far as your observation leads you to believe?—A. Yes; wherever the company stores exist.

Q. Is the company store generally adopted by the operators in the different mining sections?—A. During the last year a large number have been opened up, and I believe there are more being contemplated in the Pittsburg district. During 1896 they were pretty much all done away with, but they come on one after another, until the Pittsburg district to-day has a good many of them.

Q. Is that also true of other districts?—A. In the Connellsville coke region to-day, under H. C. Frick's Coal and Coke Company, they have in the neighborhood of eighteen or twenty stores, termed the Union Supplies Companies, and I know that provisions, compared with prices where I live, are from 15 to 20 per cent higher in the company stores than in the stores around our section; that is, individual stores. There is no company store where I work.

Q. Do the mining companies operating those stores usually own or lease the lands upon which the mines and stores are located?—A. In some instances large companies, such as H. C. Frick & Co., own pretty much the surface as well as the mine. There are some places where the companies will actually prohibit a huckster going into the place, and if they see a box of groceries or anything else go to a man, they inquire the reason, and sometimes it causes his discharge.

Q. Is the existence of these stores in the mining communities in any case necessary or indispensable to the successful operation of the mine?—A. No, if an opportunity was given for an individual to come in and run a store. There are many applicants for such opportunities.

Q. Is that opportunity denied individuals?—A. Yes; where they own the surface, certainly.

Q. Where there is no other store in the mining community, miners are obliged

to deal in the store operated by the company—where there is no other store convenient enough to buy any goods?—A. Yes.

Q. Do you know of any instance in which the employer directly or indirectly brought influence on a workman to deal in the store, or punished a workman for his failure to deal in the store?—A. Yes. In years gone by we established in our section a cooperative store, and the manager of the company store came to the manager of our cooperative store and told him if he did not put the prices away up where it was possible for them to live, that he would crush us out of the business. He says, "We can do it, mind you. If you doubt my word, just watch our delivery wagon." We pursued our course, and of course times came around in 1897 when the company practically abolished its company store in that section. The cooperative store sold from 15 to 20 per cent less than the company store did in that section at that time.

Q. (By Mr. FARQUHAR.) Generally, in the Pittsburgh district, are these mines near villages?—A. Well, generally speaking, yes.

Q. And in these villages are general stores?—A. Yes.

Q. Would it be possible for the miners to supply themselves from these village stores?—A. Yes.

Q. Have you such a thing as huckstering or delivery wagons through those districts there selling vegetables and meats and everything of that kind?—A. Yes.

Q. (By Mr. RATCHFORD.) Have you any companies in mind in which huckster wagons or delivery wagons were forbidden to sell goods to the miners where the company stores exist?—A. To-day at H. K. Wick's works at Wickhaven, there are notices up on the boards on the roads going into the company houses, that hucksters and trespassers will be prosecuted according to law; prohibited from going in or around the company houses.

Q. (By Mr. FARQUHAR.) Are hucksters licensed in the State of Pennsylvania?—A. Yes.

Q. Licensed for trade in the districts, on the public highways, and in the streets and villages?—A. Yes.

Q. Are there not, however, mines in isolated places where it would not be even advantageous to consumers to go long distances, and they would perforce have to trade in the company stores?—A. Yes; there are isolated cases of that kind.

Q. For instance, in the opening of new mines in new fields it becomes necessary to put up tenement houses and company stores?—A. Yes; in some cases; very few.

Q. Do you wish to make the statement here that the men that trade at those stores have not one word to say as to the prices of the goods that are sold in those stores?—A. Yes.

Q. So that they are thoroughly under the control of the owners of the mines?—A. Entirely so, yes.

Q. Are those stores usually owned by the owners of mines or are they started by parties who are in interest with the owners of the mines?—A. There are some places where the owner has them entirely; there are other places where he will get someone else to run the store, and he will get 10 per cent for stopping the money from the office.

Q. (By Mr. RATCHFORD.) Have you ever known of an instance in which a coal producer or operator failed to secure all the labor he needed at any new mine that he might open, even though he built no tenement houses and opened no stores?—A. Oh, yes; there are already cases where they can not get all the labor they want—in isolated cases, where there are no houses. That is only a matter of time; if he does that the man will have to build himself a place. Generally the miners, if they get the opportunity at all, would rather have no company houses.

Q. Is the building of company houses and the opening of stores indispensable to the operation of mines in every case?—A. No; not in every case.

Q. You believe that in every case the mines can be operated without either?—A. Either, yes.

Q. (By Mr. FARQUHAR.) You could open a mine in almost any part of Pennsylvania and get all the labor you would want in it whether the company store was there or a tenement house?—A. In a short space of time; yes.

Q. Notwithstanding the walking distance from near villages and markets?—A. Yes.

Q. (By Mr. RATCHFORD.) Speaking of the tenement house and the store and the supposed evils of which the miners complain, what, in your judgment, is the greatest menace to the trade, both from the miners' standpoint and the operators' standpoint?—A. The greatest evil to my mind that the miner has to contend with is the screen. There are so many intricacies connected with it and so many

advantages taken of it that it gives the miner more trouble than any other single thing.

Q. Differences in wage schedules in different States and sections?—A. The different wage scales in different sections are formed according to market prices and the condition of the coal. Various seams of coal have more or less difficulties, and as a result different prices, but they have all the same tendency toward about the same earning power per man.

Q. Have you anything to say as to the relative social condition of labor for the past 50 years?—A. I believe that the social condition of the laboring man to-day is much better than it was 50 years ago.

Q. What has improved the social condition, in your opinion?—A. The shorter workday gives the miner and workingman generally an opportunity to study, to elevate himself. As a result, the more knowledge he gets the higher the standard; he is desiring to better his social condition as the number increases and the conditions improve.

Q. The shorter workday has been secured by your organization, has it not?—A. True, through each other.

Q. Then your organization is one of the influences?—A. The whole of the influence; yes.

Q. (By Mr. FARQUHAR.) Has the miners' organization ever gained shorter hours through State legislation?—A. No.

Q. It has been simply by the cooperation of the owners and others in general conference?—A. Yes.

Q. (By Mr. RATCHFORD.) What can you say of the rates of wages during your experience, during the past 50 years?—A. To go back 50 years, they have fluctuated very much. They are better to-day, I believe, considerably, than they were 50 years ago in the mining industry.

Q. How long have you been in the Pittsburg district?—A. I have been in the Pittsburg district for a little over 17 years.

Q. How are they as compared with 17 years ago?—A. They are not nearly as high to-day as they were then.

Q. What price per ton did you receive, if you can recollect?—A. I think about \$1.05 per ton, or 4 cents a bushel.

Q. What is the price now?—A. To-day it is 66 cents per ton over 1½ inch screens; that is one-sixth of the screen less. It was 1½ inch screen then.

Q. Influence of organized labor on wages; anything to say on that?—A. Well, the influence of organized labor has a tendency to get better wages; that is one of its prime objects.

Q. (By Mr. FARQUHAR.) Previous to your system of conferences did not all your rise in wages come from strikes?—A. Yes.

Q. Since then it has become a matter of mutual agreement?—A. Yes.

Q. (By Mr. RATCHFORD.) Was not a reduction during those days usually resisted by a strike?—A. Yes.

Q. To-day is the same true?—A. No; we have conceded reductions, large reductions, by our organization.

Q. Employment, increased or decreased number of employees, the unemployed. Have you anything to say on that topic?—A. No. At the present time we have not very many unemployed, I believe. The work is generally fair and men are in demand.

Q. What have you to say of the effects of the employment of children?—A. The effects of employment of children are largely minimized in the coal mining in Pennsylvania. We have a law there prohibiting children until in their teens. I think it is 12 years at which the law says he can go in, but the school law interferes there and says until he is 15 years of age he has to go to school. Consequently we have not much evil effect from child labor in the mines; but I well remember when there was lots of it, and I well remember it had a very injurious effect.

Q. Which do you regard as the best law for all concerned, the 12-year limit or a higher limit?—A. Fifteen years.

Q. Seasonal causes, I presume, operate largely in your business as causes of irregular employment?—A. Yes; we have the season of lake navigation, for instance, when the lakes are open—just coming on this season—when all the men are generally employed.

Q. Ship largely from the central coal fields to the northwestern markets?—A. To the northwestern markets.

Q. River shipments also?—A. River shipments when the water is in a navigable state. They ship large quantities of coal down the Monongahela River to the lower markets.

Q. (By Mr. FARQUHAR.) Is it not usual there to have the coal shipments on the lakes about the last?—A. If everything is going on peaceably and fair, I think that they generally try to ship it during the whole of the season, but we have seen—last year, for instance—where they hold off the season very late, and make the larger shipments in the back end of the season.

Q. Was that to make a poor market in the West and bring the supply in late in the season?—A. I think it was contemplated for a reduction, for getting the coal at a reduced rate that year.

Q. (By Mr. RATCHFORD.) The average number of days employed during the year?—A. I do not suppose that the miners will average 200 days per year.

Q. Hours of labor in the several States; Sunday labor?—A. The hours of labor in our section is 8 hours. We have some little Sunday labor; machine mines, where the machines are run night and day. Coal loaded out on Saturday leaves bare places, and men will go in on Sunday night and cut coal; that is, a small portion of them. There are not many and it is not in all mines. In slack times they generally can get along without.

Q. Is this Sunday labor agreeable to the men employed?—A. If they object to it they lose their positions; they either have to do it or go.

Q. (By Mr. FARQUHAR.) What is the position of your organization on Sunday labor?—A. It is not favorable; we are opposed to Sunday labor.

Q. (By Mr. RATCHFORD.) The shorter workday, its effect, the economic and social arguments against it; what have you to say on that?—A. The shorter workday is a blessing to the country as well as the individual. Everybody is benefited by it by raising the standard of intelligence. I approve of the shorter workday in all branches of labor. I believe that the ability to produce is so much larger than the ability to consume that it is not necessary to tax the laboring people to work so long and produce so much more than we can consume in a given time.

Q. (By Mr. FARQUHAR.) Do you not think that a mine is probably as severe a test on the physical energies of a man as any trade there is in this country?—A. The coal mine, to my mind, taxes the physical ability of a man more than ninety-ninths of the trades. They are barred from the sun and pure air, and I do not believe that a man ought to be allowed to stay in a mine more than 8 hours.

Q. On account of the sanitary condition of mines and the hard work, have they not been, in the main, the reasons, both in Europe and this country, why the hours have been shortened and will be shortened?—A. Yes.

Q. It is as much a physical as a moral reason?—A. Yes.

Q. (By Mr. RATCHFORD.) The operation of existing laws as to screens, company stores, etc.; have you any laws in the different States touching upon these subjects?—A. We have no screen law. Custom or agreement has established a uniform screen of 72 superficial feet, with rod, bar, flat surface, with sufficient bevels to keep the screen in good working order; but there is no law, and there are some violations even of this agreement. I have mentioned this mine at Wickhaven, where the screen to-day stands 80 feet.

Q. (By Mr. A. L. HARRIS.) What space between the bars?—A. An inch and a quarter between the bars.

Q. (By Mr. RATCHFORD.) Was there a law in your State totally abolishing the screen that has been declared unconstitutional?—A. Yes.

Q. Is the coal that the miners mine screened before it is credited to their account?—A. Yes. The miner loads his coal into the wagon and sends it out. It is dumped over the screen. The big coal that goes over the top of the screen goes into a bin and is weighed there. The slack is taken out; there are sometimes two or three different grades of coal made out of the screenings.

Q. What percentage of the entire product will pass through the meshes or bars of the screen?—A. I think that the committee that undertook that job proved that 39 per cent did.

Q. Who composed this committee?—A. William Dodge, the vice-president of the miners, and Uriah Billingham, a member of the executive board for the miners. I think Mr. Schluederberg was one of the committee for the operators, with several other gentlemen.

Q. It was a joint committee of both the miners and the operators?—A. Yes.

Q. Of this 39 per cent that passes through the screens, what disposition is made of it?—A. All of the nut coal is sold. The nut coal for domestic purposes is practically as good as the screened lump. For many people they would prefer to have it to having the big lumps to black up. I think the difference is not very much—the difference of price between the nut and the lump coal. Slack, of course, is rated away down much less. The different markets have different prices for those grades of coal; they vary.

Q. The contention of your organization is not to abolish the screen so much as to weigh the coal before it is screened and pay the miner a common price per ton for it; an agreed price.—A. Yes.

Q. Then allow, of course, the operator to screen it and fit it for the market as he thinks best?—A. Yes.

Q. In case this is agreed to, or where it has been agreed to in any case, has the miners' organization been willing to cut down the tonnage price in proportion to the amount of screening?—A. We are willing to deal. We have two prices. We get 42.66 cents for run of mine price to-day, and 66 cents per ton for screened coal.

Q. Does your organization favor cooperation?—Yes; we favor cooperative production.

Q. Any other form of production?—A. Profit sharing. There is a thing that, to my mind, would interest every man, where the producer is to get a share of the profits. It interests every employee to bring all out of the business that there is in it. Cooperation is just the same, to my mind, only in a different form. The same end is obtained.

Q. Have you any cooperative mining plants now that you call to mind?—A. No; we have some in name; but in purpose really their chances of success are limited; and they have actually operated against the best interests of the mine, where it is cooperative in name but not in practice.

Q. What is the effect of immigration on the mining industry?—A. The effect of immigration on the mining industry has been injurious to a large extent. Men without regard to education, morals, or anything else have been brought into the mines, and the person that has been willing to put up with the lowest conditions that were possible for a human being to exist under has been the man that has been preferred in some instances, and can get employment, when a good, practical, skilled miner has been refused. I mind one instance, where I went and asked for employment in the Standard mine at Mount Pleasant, a very large concern, the mine being known to contain a considerable amount of gas, and every man required to work with a safety lamp. I saw four gentlemen get work of the superintendent when he had refused me half an hour before.

Q. What reasons do you assign for that?—A. I think that these men were more humble in appearance, and would put up with conditions that I would object to; but finally I got employment. I went down the cage with those men the next day. Each one of them had a lamp in his hand, going into a gassy mine; never had seen a lamp before, and wanted to get a light, and they commenced to pick the wick away up. They were going in there, taking the risk of every other man's life, who is depending upon the action of each individual that goes in there.

Q. (By Mr. SMYTH.) Are you a native of this country?—A. No; I am not.

Q. When did you come to America?—A. 1881.

Q. Are you a naturalized citizen?—A. Yes.

Q. Still you would be willing now to close the doors to other immigrants coming into this country?—A. No; I would not; I am willing to raise the wickets some.

Q. What suggestions would you make about regulating immigration?—A. That an immigrant coming in here should be up to a certain standard of intelligence; he ought to be able to read and write the English language.

Q. You would not be satisfied with his being able to read and write the language of his own country?—A. No.

Q. That would be prohibitory, then, that far?—A. As far as the immigrants from the Continent of Europe are concerned.

Q. Would it not leave the door open then only to Great Britain?—A. Not necessarily. It would set the people of these other countries to educate their intended immigrants up to that standard.

Q. (By Mr. FARQUHAR.) Do you take the broad view that there is enough of unemployed labor locally in this country without further immigration?—A. Yes.

Q. Do you mean that the restriction would only be temporary instead of permanent?—A. Yes; until conditions change according to the needs of industry.

Q. Are you troubled with what is called padrone or contract labor in Pennsylvania at present?—A. We have this: There is contract labor to-day; that is, those men working for the New York and Cleveland Gas and Coal Company to-day are working under a contract.

Q. (By Mr. RATCHFORD.) Does the non-English-speaking class of immigrants follow mining more than other trades, or less, to your knowledge?—A. I do not know. I think it is generally unskilled labor, and they earn more money if they can get into the mines at all.

Q. Does that class follow mining more than the other?—A. I think they follow mining more.

Q. In treating with this class through your organization do you experience any difficulty in having the men observe your rules and follow a strike order as American miners would follow it, simply regarding it as a fair difference of opinion between employer and employee that is going to be fought out along peaceable lines, or do they regard it as something more in the nature of a hostile uprising?—A. They are not as peaceable in strikes. When you get them to strike their conception is to take things by force. Nine cases out of ten when any trouble arises it is these people that are the cause of it.

Q. Have they any knowledge of the wages that are paid, or ought to be paid, for the standard of living?—A. No; they never speak of the standard of living. If they are satisfied, whether the organization wants them to or not, they are going to do as they please. They have at some times actually made attempts upon the lives of the officers of the organization when the officers have advocated certain peaceable methods.

Q. Have you quite a number of those people in Western Pennsylvania and West Virginia?—A. Yes.

Q. What is the condition of their homes as compared with American miners? Have they families usually?—A. Some of them; yes. We have in our section company, houses, 14 by 16, four rooms, or two rooms 14 by 16, and two 12 by 14. I have known as high as 23 in one of these houses.

Q. Twenty-three men?—A. Twenty-three men, a woman, and two or three children. They will sometimes arrange it with the man of the house. The man of the house, boarding boss, takes them, and the woman works for the whole of them, and the boarding boss buys the whole of their meat with one book. That book has set down under each what is bought, and each man pays the division, whatever that part is.

Q. Has your organization ever taken action in any of its conventions either encouraging or in favor of restricting immigration, or touching the immigration question?—A. No; I do not think that the organization has taken part other than to advise against the contract. I am not positive.

Q. What have you to say as to the sufficiency of public-school facilities in the several States, and suitability to the needs of the working people?—A. In Pennsylvania (that is all I know much of) we are fairly well supplied with public schools; we have nothing to complain of in that regard.

We are very anxious that an employers' liability law should be passed. It is something that is needed. A man who offers his services for the production and advancement of the trade of the country, if at the time of accident or death that trade may not be able to take care of its own men, they are helpless.

Sanitary and personal-safety laws: We believe that the best sanitary conditions that could be gotten should be had. We do not believe that it is money well saved in the shape of putting in inferior sanitary conditions.

Mine-inspection laws, we have not very much to complain of. Check weighman laws: As long as coal has to be weighed we think that the check weighman should have a right to see that every pound of coal that is in a car is credited to the miner. The check weighman there is limited to some extent in that he has not the right to demand that the scales be tested as freely and fully as he ought to. They claim that the check weighman can only test the scales at convenient times; that he is not to interfere with the operation of the mine. If a party is so desirous—and I am sorry to say that we find that at places that is so—the scales can be doctored with a touch, and as long as that coal is there the check weighman has no right to ask that they be adjusted. The coal is there, and to stop to ask that the scales be adjusted and tested would interfere with the running of the mine, and it is the policy of the operators to keep the coal standing at the screen all the time, so that it is only in the morning and evening that the testing can be done, and in one second the scales can be knocked out of gear. We have another system where it speaks of coal being weighed or measured. The system that prevails in the coke region is by measurement. Wagons are built to hold 3 tons of coal, or in that neighborhood. They are built narrow at the bottom and big or wide at the top. Under the system of measurement they demand that a hump be put on the top of the wagon at the pits, and if that hump is not up to the liking of the officials in power the man is suspended—told that he is docked for a slack wagon. The same man that only wants to scale to the full of the wagon is notified two or three times a week, and sometimes discharged entirely if he will not comply with the laws that are laid down. We believe that all coal should be weighed and not measured, and that coal should be weighed before it is screened, and the check weighman should have the right to test the scales whenever he has reason to believe that there is something wrong, whether it interferes with the running of the mine at that time or not.

Q. (By Mr. C. J. HARRIS.) Suppose the miners wanted to change the scales and have them tested about fifteen or twenty times a day?—A. If the check weighman had reason to believe that the scale was out of gear, I believe that it would only be reasonable and fair that it should be tested.

Q. Do you mean to imply that they cheat you with regard to weights?—A. Yes.

Q. Have you definite proof of it?—A. Yes.

Q. Just give any definite proof of it?—A. Well, we sent Mr. Steen to State prison for it, but through some technicality of the law he was let out.

Q. That is one instance. Have you any other instances in that regard to offer? Mind, you make the general charge.—A. I do not know that I made a general charge. I am telling you the possibility.

Q. We do not want possibilities, but facts.—A. Well, I could not.

Q. (By Mr. RATCHFORD.) Do I understand you to say that every operator cheats in weight?—A. No.

Q. You have been asked to point out an instance, and have pointed it out; and now, if there is any further proof required, would you refer the commission to the investigation of the legislative committee of Pennsylvania?—A. Yes.

Q. In order that the position of the organization that Mr. McKay represents here may be more thoroughly understood, I want to ask him one or two questions. Many things have been brought out in the testimony to-day that would lead men without his knowledge of the conditions of the mining trade to believe that there are many injustices practiced. I want to ask if it is not a fact, in his experience, that the average coal operator with whom he has come in contact wants to treat his men fairly, as much so as in other trades, allowing for a fair difference of opinion to exist as between him and those men or their representatives?—A. Yes; generally speaking.

Q. Is it not also a fact that the small operators, even the single operator, such as you refer to in the De Armitt case, who has a large production, can do more injury to the coal trade from the standpoint of the miners, than twenty operators can do good, who have a production equally as large?—A. Yes; that is right.

Q. That being true, then we are to understand that your organization has no fight against the operators as a whole?—A. No; not as a whole.

Q. And that in most cases the operators join hands with the miners' organization to try to reach the evils and remedy them?—A. Yes; that is right.

(Whereupon the commission took a recess till 2 o'clock.)

STATE OF PENNSYLVANIA, *County of Allegheny.*

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

EDWARD MCKAY.

Sworn and subscribed before me this 5th day of July, 1899.

H. R. MCPHERSON, J. P.

WASHINGTON, D. C., *April 12, 1899.*

TESTIMONY OF GEORGE W. SCHLUEDERBERG,

Coal-mine operator, Pittsburg, Pa.

The commission met at 2.20 p. m., Vice-Chairman Phillips presiding. Mr. George W. Schluederberg, coal-mine operator, Pittsburg, Pa., testified, the topical plan of inquiry on mining being followed.

Q. (By Mr. C. J. HARRIS.) Where are you operating?—A. We are operating in the southwestern part of the State on the branch of the Pennsylvania Line known as the "Pan Handle." We are also operating a little east of that, on the Baltimore and Ohio Railroad, on the Wheeling Division, and are operating on the Baltimore and Ohio Railroad, Main Division, just west of the Connellsville district, and we are operating to the north, on one of the branches of the Baltimore and Ohio Railroad, known as the Pittsburg and Western.

Q. Just generally?—A. In the Pittsburg district. We have three localities, of twelve mines: The First Pool Monongahela Gas Coal Company, the Pittsburg Consolidated Coal Company, the Robbins Coal Mining Company, the Willow

Grove Coal Mining Company, the Midway Block Coal Company, the Oak Ridge Coal Company, the Robbins Coal and Coke Company, the Pittsburg and Chicago Gas Coal Company, the Waverly Coal and Coke Company.

Q. What is the number of miners you employ?—A. About 2,000.

Q. What do you know of the growth and general results of trade unions in your part of the State and community?—A. Trade unions, in my early experience, which was some 30 years ago, were very overbearing and caused a great deal of embarrassment; but in later years, since there has been a closer coming together between the laboring men and employers, our dealings in the Pittsburg district with the organization known as the United Mine Workers have been very satisfactory. In the early days of the mining industry things were in rather a crude state. We have learned much, both operator and miner, in coming together in our annual or interstate meetings. We have worked in a harmonious way on lines of conciliation and arbitration; have never had to resort to arbitration, but have always arrived at results by merely consulting, becoming acquainted with one another's condition, and agreeing upon terms. That is my experience in the Pittsburg district; and as far as labor unions are concerned, the only drawback to those who recognize them in a manner, is that they are not strong enough or able to enforce conditions in competitive districts, and thereby we labor under more or less disadvantage, for the reason that we agree, and are in a manner bound to do certain things, follow out certain lines that others in surrounding districts and surrounding States are not called upon to do, and at times it makes it a hardship to operate on the lines that we do.

Q. Where is your chief trouble at present from that competition?—A. The chief trouble lies within our own Pittsburg district and West Virginia.

Q. What is the proportion of employees in the mining industry in the Pittsburg district who are members of trade unions?—A. I am not well informed on that; my opinion is that about 25 per cent of the miners of the Pittsburg district are, properly speaking, members of the labor organization—are proper members—but the miners in the entire district are controlled by them; that is to say, that in case of any question arising whereby the organized board takes a certain stand, there is no trouble in having the nonaffiliated falling right in line and following out their dictates.

Q. (By Mr. FARQUHAR.) What are the competing markets as against the Pittsburg district and other districts that you know of as an operator?—A. The market of the Pittsburg district for 8 months of the year is by rail and water; from the mines by rail to the ports of Lake Erie, from there to the Northwest, taking perhaps 5,000,000 tons during that 8 months in the year. That is a competitive point for the coals for the Northwest—by which I mean landing places—Duluth, West Superior; and from there it is distributed all over the Northwest. Those cities have a competitive market for the Pittsburg district, the Ohio coal, and a part of the Indiana coal, and largely Illinois coal; Illinois coals having this advantage, that they are nearer to the market and can reach there by all rail; we can not. It is also a market that is sought and taken by West Virginia, a comparatively new country without any system, where men do as they please, as we did in the Pittsburg district years ago; where men are paid lower wages and are not fairly treated; and railroads make lower rates and run that coal into what we call our market or our competing point, and it is in that way a disturbing factor.

Q. Is it so that there is an arrangement among the producers in the Pittsburg district for a division of markets, or are you all competitors?—A. We are all competitors with one another, which is an unfortunate condition.

Q. Would you say that the low wages and the less organized features of bodies in the West Virginia mines give them that opportunity to compete as against Illinois, Indiana, and Ohio coal, the Pittsburg coal, say, in the Chicago market?—A. Yes.

Q. The low wages would be a controlling factor, and probably the discrimination of rates?—A. Those are the conditions, the low and unsystematic wage rate, and a low railroad rate as compared with others. That coal not only becomes a competitor in the markets of the extreme Northwest, but also in the markets of Chicago and points a little east of that.

Q. (By Mr. CONGER.) Do you know if the railroads are interested in those West Virginia mines, or what are the reasons for the discriminations?—A. So far as knowing, I do not know whether they are. I think, in some cases, to begin with, these roads are opened up into regions where they have no earning power, and are all depending upon this coal, and I think the road considers it to its interest to haul the coal at a rate which will put it into the market, in order to get the road business and an income, and I think, in addition to that, at times officers of the roads are interested; now, that I do not know, I simply think that.

Q. (By Mr. C. J. HARRIS.) Is there fineness in the quality of the coal—better quality or different quality—that would lead to its driving you out of these competitive points named?—A. As far as the Pittsburg coal is concerned, no. There is not on the face of the earth a vein of coal so well located or complete, and so regular, and that can be so well mined, as Pittsburg coal. Then coming to the quality of the coal, I do not think it can be surpassed. I think the coal coming from West Virginia is inferior to our coal.

Q. (By Mr. RATCHFORD.) Please explain whether coal is mined and weighed on the same basis in West Virginia as it is in competing States?—A. It is not. I have information from there that was gathered particularly for the information of our joint interstate meeting that took place in Chicago. Our information is that the coal, instead of being weighed, is mined there by measure, and that means anything.

Q. Has it been the contention of the operators of your district and of Ohio and other competing districts, whose trade was being injured materially by competition from West Virginia or supposed to have been, that coal mined within that State, under that system of measurement, was not all paid for; that the miner mined considerably more coal each day than he was credited with?—A. That is what I mean when I say being mined by measure; the miner does not know what he is getting, and is not getting what he should get.

Q. What is your opinion in regard to the cars or carriages in which this coal is measured; is there any truth in the charge that when they are replaced by new ones, the new ones are always larger than the old ones and the standard of measure remains the same?—A. That I do not know.

Q. There are three points in which you believed that West Virginia has an advantage over competitors; first, in cheaper tonnage; second, discrimination of freights; third, by reason of the system of measurement instead of a rate.—A. Unsystematic mining.

Q. (By Mr. FARQUHAR.) What is the difference in wages paid in the West Virginia districts and in the Pittsburg districts to miners?—A. I do not think there is such a thing as a West Virginia scale. Each mine seems to make its own prices. Our reports are that at one mine they pay so much per wagon, 83 cents; a wagon may contain 40 bushels, which is 2 tons; we pay for the same grades of coal, run of the mine, 42½ cents per ton.

Q. (By Mr. C. J. HARRIS.) Do you have the same disadvantages to contend against in your own districts with unorganized miners?—A. We have, right at home.

Q. (By Mr. FARQUHAR.) Are the mines of the Pittsburg district generally worked, as far as your miners are concerned, by union labor?—A. To the extent of the number that are, strictly speaking, members of that organization; but we have within our Pittsburg district large mines where union labor is not at all recognized, that are working entirely with nonunion labor.

Q. Do you know of any system of discrimination against union labor in the Pittsburg district, with the exception of one or two mines, on the part of the operators?—A. No.

Q. Is it not a fact that usually the union labor is most efficient in the working of your mines?—A. Not necessarily; we have very good miners that are not union miners.

Q. Is it not an advantage on the part of the operator there to have all the men, through the representatives of the committees, to make arrangements with respect to the scale of wages and the other privileges attached to mine operations?—A. As I have already stated, this is a disadvantage against us. Right in our own district there is a large body working as unorganized men of outside States against us, which makes it a hardship upon us; who believe that experience has taught that this is an unfair way of ruling us. The one fault I have to find with the labor organization is that they are not able to regulate matters so that the entire thing will be uniform.

Q. You would think, if it were thoroughly organized in the Pittsburg district, these conferences would result to the benefit both of the miner and the operator?—A. In view of past experience, yes, if conditions remain about as they are. Labor organizations as well as operators are controlled by human nature. There is a possibility that organized labor, becoming too strong, might become troublesome.

Q. Is it not a positive benefit to the operators in any district in the country to have, for instance, an organization in Illinois which will establish suitable rates and suitable prices for operating mines, and one in Ohio and Indiana; does not that help your district in the long run?—A. It most decidedly does.

Q. (By Mr. SMYTH.) Do you employ any nonunion labor?—A. We employ both. We do not dictate to our men whether they shall be organized or unorganized; some are and some are not.

Q. (By Mr. PHILLIPS.) Do they work mixed?—A. Yes.

Q. (By Mr. RATCHFORD.) Is the strength of the labor organization to be feared so long as its numbers remain the same, if its leaders are equally as conservative as they are at present or have been, and is not greater fear to be apprehended from an organization that is led by hot-headed men, even though it is weak, than from the same organization, strong as it may be, led by conservative men?—A. Organized labor, led by able, conservative, strong men, is the better of the two.

Q. (By Mr. C. J. HARRIS.) Do you think that competition of other districts and the competition arising from unorganized labor has the effect to keep organized labor down within legitimate, reasonable bounds?—A. It does keep them within certain bounds because they are not organized in competing districts; they can not ask quite as much of the unorganized districts as they might or would ask if they were all organized.

Q. (By Mr. RATCHFORD.) Is it a fact that if this unjust competition of which you speak were removed, that the operators of your district could afford, without injury to themselves, to pay a higher price for mining and have equal opportunities to that of the present?—A. That is true. We could afford to pay a little more for mining and make more money.

Q. Then the demands of the organization, whether high or low, are measured by the conditions that surround the miners and the operators, taking into account the competitive price, and those conditions are recognized by organizations as well as operators?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Strikes, arbitration, etc.—A. The question of strikes, I do not know that I can give you any new light on nor the results of the same. I think strikes are always wrong and result in disaster to the employer and employee and to the community at large. The striker may claim victory but he has not gained anything; he is just that much behind—just that much poorer. The employer has his plant upon which there is always a fixed charge and which is really cheaper to be in operation than idle. The community at large loses because the men are not employed. The boarding-house keepers, the storekeepers, and all lose.

Q. (By Mr. FARQUHAR.) Suppose the strike runs 3 months, do fixed charges go on?—A. As at present constituted, yes; before the era of machinery, no.

Q. (By Mr. A. L. HARRIS.) What do you mean by fixed charges in the mines?—A. Our mines at this late day are further underground; we have water to pump whether we are running or idle; we have roads to keep in repair whether the mine is in operation or not; we have certain machinery used in the operation of our mines that is to be looked after and kept in motion; all of which amounts to a great deal.

Q. In your experience what have been the general causes for strikes?—A. In a general way man's unfairness to man. In some cases the operator has been at fault by trying to take advantage of conditions when he thought he could force lower prices, depress prices of mining, thinking he would gain something in the market. On the other hand, men have, for very trivial causes, struck in the past; but I will say this, that since our interstate agreements control the miners, and indeed the mine workers, we have not had this trouble.

Q. Do you find, with the progress of labor organizations, less trouble about strikes, or more, than you formerly did?—A. Less.

Q. (By Mr. FARQUHAR.) The principles that actuate organized labor have not changed in the last 15 or 20 years, have they?—A. The organization of miners has brought about yearly State and interstate conventions, at which miners and operators have met, become acquainted with one another, learned their wants, and become acquainted with the faults of one another; have consulted together, so that we know one another better. We, as operators, are a little more liberal, and fairer; so are the miners in the same measure. There is more intelligence on both sides.

Q. Suppose that in your conferences the miners and operators came together to make a fair living scale for the miner, agreeable to the operator and the miner, to sustain a certain or prearranged amount of product of the output on the part of the operator, would not that mean control of your markets and fixing prices for the consumer all over the country?—A. Well, if we were able to do that, it would certainly be better for both parties. We can not control selling prices; we can simply agree upon a price to be paid the miners, making that all that the business will warrant, the operator taking his chances on making it either a loss or a profit. The conditions surrounding business in the Pittsburg district are such that we can not control selling prices; in other words, there is an overproduction and has been for years.

Q. Suppose that all the operators and all the miners joined; can not they con-

trol the prices then to the consumer all over the country?—A. If it was not for that word "if" they could; but they can not—never will.

Q. (By Mr. C. J. HARRIS.) Would not that state of affairs be hard upon the consumer of your product?—A. Not necessarily, if the same spirit of fairness prevailed that prevails now. Take, for instance, the coal business of Pittsburgh: if it were put in a trust to-day, there could be 10 cents a ton put upon it, to give the operator only a fair price, making it a very liberal price to the consumer, and enabling the operator to pay the miner readily what he is paying now, with perhaps a small per cent of advance.

Q. (By Mr. SMYTH.) You do not object to the trusts, then, on principle?—A. As an individual, I am opposed to the present conditions. I believe in the times gone by, when there was an opportunity for small traders to do business. The conditions surrounding us at the present time are such that we must go with the times or sink. Therefore I am forced into the belief that the only salvation of the coal business is the trust; a trust of this nature, with money enough to buy up the entire Pittsburgh field and put it under one head, and do what I said, raise the price of coal 10 cents per ton, and they can make—what has not been done in the past—they can have an income on the capital invested in the trust, and treat the consumer and miner fairly.

Q. (By Mr. PHILLIPS.) What is to prevent them raising either 25 or 50 cents a ton?—A. They could hardly do that; that could not come about even in the Pittsburgh district. A trust coming in there now could not only buy up the principal mines but perhaps all the mines; but the conditions in the Pittsburgh district are peculiar; we have so much coal which is easily opened that if they went into the business on that basis there would certainly be more coal opened up. It is beyond the scope of any trust to take it all. I do not think that will ever happen.

Q. (By Mr. FARQUHAR.) Is it true, as a business proposition, in Europe as well as in America, that an inordinate high scale of wages, or inordinate price to the consumer, can not be sustained for any length of time?—A. That is our own experience, so far as my information goes.

Q. (By Mr. C. J. HARRIS.) What have you to say in regard to the way these unorganized operators run their business?—A. I am speaking of our interests and our conditions as an individual. I believe in the right to contract, and I believe that I have a right to hire whomsoever I please and discharge whom I please. On the other hand, the workman has a right to work for me or not. I would not under any circumstances allow him to dictate to me whom I should employ, with all due respect, and acknowledging their worth in our dealings. I regret exceedingly they are not able to cover the entire territory of the Pittsburgh district. The fact of their not being able to do that is causing to the operators of the Pittsburgh district—some more, others less—quite a financial loss on their investments, for the reason that certain operators are producing coal with the pick at a price fully as low or less than it is costing us to produce with machines. It costs us a certain number of cents per ton less to produce a ton of coal, to mine it, with the machine than by pick. There are certain operators in the Pittsburgh district who are paying a less price for pick coal, are producing it a little less than those who have machine mines. It is unfair, and it has caused a great deal of trouble and loss to the operator and disaster to the miners at times.

Q. (By Mr. RATCHFORD.) Will you explain how these losses have been caused?—A. The man who is able to operate his mine at from 10 to 15 cents per ton less than his competitors of that district simply walks out and takes in all the good trade and leaves to the others just what he does not want.

Q. In that case does he take contracts that he can not supply in time?—A. He takes all he can get. It is more than his mine can supply.

Q. And in that way makes prices for the others?—A. He does. He has that advantage; and where there is an overproduction, the man that produces at the lowest price takes the contract.

Q. (By Mr. PHILLIPS.) Are there not natural reasons why some mines can produce cheaper?—A. As far as different localities are concerned, no; as far as individuals or different mines are concerned, yes. There is another thing; he may not have water to pump; he may work in light hills that have no expense in perfecting the necessary ventilation; he may have another mine that goes into a deep hill, and have gases to contend with, and have the expense of ventilating it. There are endless points which make one mine more expensive to operate than another. They are scattered throughout the district.

Q. Does the thickness of the vein have anything to do with it?—A. It does. The Pittsburgh district has two conditions; the thin vein striking an average of 4 feet and running up to 5 feet in thickness, and another vein 8 feet and sometimes 9 feet in thickness. They have been disturbing elements there. They are the ones that I referred to.

Q. (By Mr. C. J. HARRIS.) What have you to say about the importation of new or foreign labor in case of strikes?—A. Importing labor in the Pittsburgh district from foreign countries has not been the case. I do not include the Connells-ville district; while it is Pittsburgh coal, it is not Pittsburgh coal proper, lying at the foot of the Allegheny Mountains. They have imported foreign labor.

Q. (By Mr. CONGER.) In case of a strike, have any operators imported labor from other districts of other States?—A. We have; I have; not very recently.

Q. (By Mr. PHILLIPS.) White or colored labor?—A. Both white and colored. We have negroes from the South, and we have taken mixed nationalities from New York.

Q. (By Mr. CONGER.) Were they experienced miners?—A. No.

Q. Did you find them as efficient in the mines as experienced miners had been?—A. After a short period of probation, as it were, teaching them.

Q. About how short?—A. We made them coal miners in 2, 3, to 4 weeks.

Q. It is usually in case of strikes that you import these laborers?—A. Yes.

Q. Are strikes brought on by organized or unorganized labor?—A. By unorganized labor mostly.

Q. What was the cause of this strike?—A. Men demanding greater wages than we could afford to pay.

Q. Were you at that time paying by the day?—A. Paid by the ton.

Q. Do you remember what that price was?—A. We were paying, as far as my memory serves me, 78 cents a ton, and they wanted 91 cents. This was in 1884.

Q. About how many men did you import at that time?—A. We brought 50 negroes from Virginia.

Q. How many from New York?—A. At that time none. Some years prior to that a number of operators jointly brought some 300 Italians from New York.

Q. What was the final result of this strike when you imported the 50 negroes? Did the men go back to work?—A. The final outcome was that the men went back on our terms.

Q. (By Mr. PHILLIPS.) What became of the negroes?—A. They remained right there where they were, and there was not really anybody thrown out of employment at that time, because during strikes men scatter.

Q. (By Mr. C. J. HARRIS.) What has been your experience in strikes with conciliation, mediation, and arbitration?—A. We have had experience in that with the miners for the past 12 or more years.

Q. Have you been able to effect anything?—A. We have always brought about a satisfactory condition of affairs. I think it worked along without any trouble until after the depression began in the coal business, about 1891, and getting worse as we went along, until, in 1897, through the general demoralization of the trade and overproduction of fully 50 per cent, individual operators tried to reduce the price of mining, and there was a rupture between the miners and the operators; really a violation of an agreement that was made, but in a manner forced upon the operators because of the conditions existing in the district that I have already spoken of—that is, a lower price in the district than we had agreed upon with the miners. That is the only trouble we have ever had during all the period of our intercourse with the miners, as far as my experience goes, and to my knowledge and information it has been very satisfactory.

Q. You have been able to settle by arbitration?—A. We have never had to resort to arbitration. It was in coming together and comparing notes and arguing, where demands were made by the miners that were considered exorbitant or outrageous. We simply talked the matter over, and in some cases flatly refused to do certain things, and finally came together with them.

Q. (By Mr. RATCHFORD.) You assign the cause that you have just spoken of as the chief cause that led to the strike of 1897—individual operators cutting the price, and to that extent violating the contracts?—A. That is my remembrance of that affair.

Q. Are you satisfied that the miners' organization tried to avoid that strike or did they court it?—A. I will say for the miners' officials that they did all in their power to avoid that strike. I will say for the operators that many of them saw the injustice and evil of it, but had to fall in because others, who were large producers and were not of the same opinion, were not as liberal, and insisted that they should have as good treatment as anybody in the district.

Q. Do you think, as a whole, that that strike resulted in advantages to the trade, shared by miners and operators alike, or otherwise; do you think it did any good?—A. I do not think it did. The same conditions that existed prior to the strike still exist; that is, the particular conditions I have referred to.

Q. (By Mr. CONGER.) Are not the miners receiving better pay now than they did before the strike of 1897?—A. Yes.

Q. Then the miners must have gained by that strike?—A. Yes, as far as price is concerned, because the effort was made to bring them down to this lower price of the district. They were getting, I think, 65 cents a ton, and the effort was made to bring them down to 54 cents or less. I think that was the price of some of the competitors.

Q. What do you pay now?—A. At that time we worked upon the basis of inch-and-a-half screened coal; now we are working on a recent agreement—inch-and-a-quarter screened coal. We pay 66 cents a ton for that, or 42½ for run of mine. In run of mine we pay for all that comes from the mine. For the privilege of screening that coal we pay the difference between 42½ and 66 cents.

Q. (By Mr. A. L. HARRIS.) Do you give your miners the option of screening or run of mine?—A. We do not; and generally it is not given in the Pittsburgh district. Our markets there require screened coal, and we screen our coal and pay for screened coal.

Q. (By Mr. CONGER.) Do you pay for any coal mined at the rate fixed for run of mine?—A. We have one particular small place where we furnish coal direct from the miners to the railroad, where it is taken as run of mine, and we pay the miners run of mine; just a small fraction of our business.

Q. You do not in any case pay the miners for run of mine and then afterwards screen the coal yourself?—A. No.

Q. Is that practice in vogue anywhere?—A. That is being done in some localities.

Q. (By Mr. C. J. HARRIS.) What is your experience in the use of injunctions in cases of strikes?—A. I have had no experience personally in that line. I have never had an injunction served on me, nor have I ever had occasion to serve one on labor leaders, either organized or unorganized. On the several occasions that I have imported men I made it my individual business to remain with them, and can say for myself that I made it a success in every case.

Q. Wages and method of payment: What system of payment is in use in your district?—A. We pay our miners in cash bimonthly, and I think that is generally done in the Pittsburgh district. There is a law requiring bimonthly payments.

Q. (By Mr. RATCHFORD.) Is it observed generally?—A. I think that the miners are paid every two weeks at all the mines I know of.

Q. Do you mean by cash payment, where men receive the surplus due them in cash after their store bills have been deducted, or do you mean that they receive their earnings in cash free from any deduction?—A. I mean their net earnings. It is customary to deduct from the miner such charges as are made against him—blacksmithing, house rent, coal, etc.; then, where store orders are used, they are also deducted from the miner, and he is paid the net balance. What I specially mean to say is that they are paid every two weeks.

Q. You do not consider a company as paying cash that makes it a practice to run a store in connection with the works and have the men deal in it, and deduct from their wages the amounts of the bills?—A. Yes and no. I do not know of any companies now that run company stores. I know of companies that give orders on stores and deduct the same from their men, and so far as my individual judgment and opinion goes I do not see anything wrong in that.

Q. Is there any compensation given the company for that deduction?—A. There certainly is.

Q. Do the company employing the men and the company supplying them with the necessities of life, even though they are separate, work hand in hand?—A. As far as collecting the bill is concerned the company is responsible for it, and must pay it, and therefore collects it.

Q. (By Mr. C. J. HARRIS.) You see no special objection to that?—A. I do not. I think that where an employee working for an employer is fairly and justly treated as to all that is due him, it is no more than right and proper that he should give his employer the preference in his purchases of the necessities of life, provided that he can buy there just as cheap as he can in competing stores and as cheap as others can buy for cash at these same stores.

Q. (By Mr. RATCHFORD.) Would not that also apply to other lines of business? For instance, an employer engaging in any other line of business, his working-men, according to that process of reasoning, would be under the same obligation to deal with him.—A. The mining industry is somewhat different from a manufacturing or commercial business in a city. There are peculiar conditions surrounding it. The men are isolated from places, and in many instances would suffer if it were not for credits advanced them by the companies.

Q. (By Mr. C. J. HARRIS.) Company furnishes them powder?—A. Not in the Pittsburgh district, as a rule. The powder there does not amount to a great deal, and they buy it with their supplies.

Q. (By Mr. RATCHFORD.) I have not referred to other industries, but rather to coal companies branching out into other businesses.—A. I do not believe in paternalism; but as far as doctors are concerned our experience has been this: At one of our largest mines there is an agreement between our men and the doctor for a stipulated sum per month. He furnishes all the medicines and all the medical attention needed, either in case of sickness or accident. That doctor would not do this unless we guaranteed him his pay, and in that case I think it fair; and I am free to say that in one case only, where we consider it a necessity, we do that; even collect for the doctor. It is optional. The man exercises his own free will whether he will enter into it. He is not forced into it either by the company or the doctor. After he enters into it, it is to our interest and the doctor's to see that it is paid, because when he is hurt or sick he needs attention.

Q. Is it a fact that it is the abuses that the miners have always complained against rather than the custom itself?—A. It is only the abuses that they have complained against.

Q. (By Mr. C. J. HARRIS.) Have you anything to say in regard to sliding scales of wages?—A. As far as the Pittsburgh district is concerned, it is impracticable.

Q. In regard to the living wage?—A. Do you mean what a man should earn to live?

Q. Yes; what would be the lowest minimum wages at which a man could possibly work?—A. A miner should not earn less than \$2 a day at present.

Q. Do they earn it?—A. The price at the present time is 66 cents a ton; the average output of a miner, according to statistics of Pennsylvania, is 2½ tons.

Q. (By Mr. RATCHFORD.) Statistics of the whole State?—A. Of our region; now, that is not \$2. I am giving you my opinion, that a miner who can not mine 3 tons a day should be doing something else; he has missed his vocation. And I do not believe that one man is worth as much as another; that has been one of the faults of labor organizations—not exactly the fault of the miners' organization, because we have a piece price; if a man mines 3 tons he is paid for 3 tons. I do not believe in putting men on equality, because we have men who can mine 3 tons while we have others who, with great effort, can only mine 2 tons; we have other fellows who go in late and come out early, and that is why the average of the Pittsburgh district is so low. In all fairness a man should mine 3 tons of coal a day.

Q. That is, hand mining?—A. Yes.

Q. Can you give any idea as to what is the money cost to the miner of the supplies necessary to produce a ton of coal, such as powder, squibs, repair of tools, purchase of tools, etc., which are a part of his equipment?—A. The expense of a miner, as far as my experience goes, would be in the neighborhood of from 10 to 15 cents a day. That would cover his oil and everything under average conditions. I think that will cover it. The man known as the butcher in mining parlance can smash tools without end. If we would admit a greater expense we would have to increase the earning power, because I am taking him into question when I make the average 2½ tons.

Q. (By Mr. C. J. HARRIS.) Fines and penalties.—A. As far as fines and penalties are concerned, miners are required to mine their coal in the mines and load it clean; that is, not to throw in any slate, and as far as my knowledge and experience goes the weighmaster is instructed to tell the men not to send out dirty coal. If he does he is warned. We have no system of fines and dockage. I do not believe in that, because it does not bring about the desired result; simply docks something from the miner and does not benefit the operator, and causes bad feeling.

Q. Could you get along without some system like that?—A. We must have system and rules. The mine can be run only by one man. Everybody there can not do as he pleases. Personally I do not believe in dockage. I believe a man can be reached better and fairer by warning him, and then, if he will not obey orders, laying him off.

Q. In regard to mine tenements.—A. As far as mine tenements are concerned, the miners should be furnished good houses the same as good mines. Thirty years ago, when I went into the coal business, we had no mining law. The miner went into a hole in the ground. He breathed whatever air was in there. Now we ventilate our mines. We are compelled to, and it is an advantage to the miner and the companies. They have progressed. They should be furnished good, clean, comfortable homes at a fair price. That we do, and all the larger companies in the district as far as I know.

Q. Are your mine tenements in the Pittsburgh district of a permanent character?—A. They are put up, a block of 8 rooms costing, perhaps, \$800, well built, and plastered, with all the modern conveniences, water, etc.

Q. (By Mr. SMYTH.) Do you compel your employees to live in these tenements?—A. Yes, where we have houses; and we are obliged to build houses in some places because there are no others.

Q. That is the fact at some of the mines?—A. Yes; in several cases. We have a case now where, in order to get men enough to run the mine, we are building 50 houses. In this case the men have to live in our houses because the men have no others; and if there were other houses, I would expect our men to give our houses the preference.

Q. It is a fact that there are towns where there are no houses, and the mining companies have to provide houses or tenements for them to live in?—A. Decidedly; I am doing that now.

Q. (By Mr. RATCHFORD.) Can you point out any illustration or single case in which an operator failed to get enough men, even though he had no houses for them to live in?—A. Yes. Our First Pool mine to-day. We are short 100 men. We had plenty of applicants for work, but had no houses to put them in. We are just building 50 new houses.

Q. Is not the capital that is invested in tenement houses, in the coal business, bringing the same returns as capital invested in other lines?—A. As far as the coal business is concerned, the investment from the houses, yes; the coal business proper has not paid.

Q. Then it was a paying investment to build tenement houses around the mines; they are not built alone for the purpose of housing the employees; they are built because there is money in it?—A. In our particular case, the first reason that we build the houses is that we must have them; and we are not doing it for charity; we are doing it to make money out of the investment besides that; but we could not run the mine without these houses.

Q. (By Mr. SMYTH.) Is it a fact that there are mines kept open because of the profit from the company store and rent of the tenement houses, where, if there were no store and no tenements, the mines would be closed down?—A. I know of no such cases.

Q. (By Mr. C. J. HARRIS.) Will you tell us the relative social conditions of mining labor, say from the time you first commenced, and compare it with what it is to-day?—A. The miner is on decidedly a higher plane to-day than 25 years ago. He then, as I stated, not only worked in a miserable hole, but lived in a miserable hovel; and you put a man in an inferior house and he is not going to be respectable. As the time went on and the people became more enlightened and respectable they required better homes. We must build better houses for them. They were not earning the wages they can now. They became educated and required more, and they have it.

Q. Are wages higher on the average now than when you first became acquainted with the business?—A. Prior to the war, in the Pittsburgh district—then it was all shipped on the river—they mined coal as low as 1½ cents a bushel. That is equal to about 40 cents a ton. Just after the war we paid 5 cents a bushel, \$1.30 a ton, then down to 4 cents, then to 3½, making it a little over 78 cents a ton; and now we are paying 66 cents a ton and the men are living better.

Q. Can a miner mine as many tons to-day as he could then?—A. Our miners of to-day do not produce on an average quite as well as they did then.

Q. Do they work as many hours?—A. No.

Q. (By Mr. FARQUHAR.) What nationality predominated in your Pittsburgh district in the early days?—A. German and Irish; some few English.

Q. What is the prevailing nationality to-day?—A. We have so many it is very hard to enumerate. We have a few of the Germans left, very few Irish, very few English. We have French, Belgians, Negroes, Slavs, Italians—pretty well mixed.

Q. (By Mr. CONGER.) Any American born?—A. Very few American born will mine coal.

Q. (By Mr. A. L. HARRIS.) What was your wage based on just after the war, specie payment or paper?—A. In the prevailing currency.

Q. (By Mr. C. J. HARRIS.) What has been the influence of organized labor on wages?—A. Organized labor has held wages to a better standard—better plane—than they would have been without; has helped to raise the miner to a higher plane.

Q. Has there been an increase or decrease in the number employed?—A. The number employed has of course increased in our locality, because in spite of the depressed condition of affairs there have been more mines opened and more men required. That has been cut into by the introduction of machinery displacing men.

Q. (By Mr. FARQUHAR.) What was the difference between 30 years ago and 10 years ago in the output of the Pittsburgh district?—A. I will answer that by referring not to any one particular mine. Then a mine putting out from 700 to 1,000

bushels a day was doing a profitable business, but if we can not put out to-day about 12,000 bushels we might as well not run; and that has been brought about by improved conditions, better mines, and machinery. The profits on coal are so low that we must have a large production in order to exist.

Q. Have any figures been furnished by scientists or practical men as to the possible amount of output the Pittsburg district would stand without exhaustion? In other words, how many hundreds of thousands of tons is it generally supposed the Pittsburg district holds now?—A. I do not think we have advanced far enough to know that. I do not think there is any such information in existence.

Q. Have you no geological survey in Pennsylvania?—A. We have; but it has not been followed up closely. It is only lately that the mining bureau of Pennsylvania has been created. Heretofore the reports from the various districts have come to the Interior Department, and there has not been a close tally kept of them, nor has the geological-survey question been followed up closely; so I do not think the department in Harrisburg has that information.

Q. (By Mr. PHILLIPS.) Is it considered practically inexhaustible?—A. No. I would say for myself that, at the rate we are going, in 75 years from now there will be very little coal left in the Pittsburg district of the Pittsburg vein.

Q. Do you mean it will take up to Freeport, up to Butler and Washington counties?—A. I consider the Pittsburg district proper running from north to south 55 miles, from east to west about 50 miles, and I think 75 years, at the rate we have been going during the last ten, will exhaust that coal.

Q. That would not exhaust Butler or Washington counties?—A. No. The formation in Butler is lower coal. The Pittsburg coal runs only from the West Virginia line on the south, from the Ohio River on the southwest, and then it is cut out on the north by the Allegheny River from erosion. On the north side the coal has been cut out. It does not reach Freeport. In Freeport we have that vein 600 feet below. It does not reach within some distance of Connellsville.

Q. You would consider the outlying counties more inexhaustible than even the Pittsburg field which you have described, would you not?—A. Yes; taking all the different conditions we have.

Q. (By Mr. C. J. HARRIS.) What have you to say of employment of children in your district?—A. We do not employ children. Under the mining law we are not permitted to let anyone under 12 years in the mine, even in charge of his father. We are not permitted to employ anyone under 16 years. We are not permitted, of course, to employ any female; and I do not believe in boys 12 years of age going into the mines.

Q. What are the causes of irregularity of employment in your business and district?—A. Overproduction.

Q. What is the average number of days help is employed there?—A. Two hundred and fifty days a year is a fair average.

Q. What are the hours of labor per day in your district?—A. The hours of labor per day to the miner in the Pittsburg district, under the agreement with the United Mine Workers, are 8 per day; that is to the miner only.

Q. How does that affect the operators, favorably or otherwise?—A. As far as the operator is concerned it was a mistake. It was an agreement entered into in Chicago. It was taken advantage of on the spur of the moment. The change was entirely too radical. It simply means to the operator that under the late improved conditions in the use of machinery his plant can be operated only 8 hours out of the 24, where it should run the 24. It is a loss, to begin with. We had 10 hours before. It is the loss of operating the tippie. What I mean by the tippie, is where the coal is loaded on the outside. That tippie should run 10 hours a day in order to give the operators a fair use of their machinery. The miner has not gained anything by this 8-hour day, in my opinion. The miner is a sort of a free lance; he goes to work when he pleases and he comes out when he pleases. We are not able to control him, and, as far as my experience goes, he works no less hours now than he did before. I hold that he never worked much more than 8 hours before, for the reason that he went and came as he pleased. I do not think it has bettered his condition so much more, and it remains to be seen what his average earnings will be after we get the reports of last year. This has only been in existence since April, 1897.

Q. Would that contract prevent you from running different shifts?—A. No; we are permitted to run different shifts, but it is impracticable in a mine; that is, generally speaking. You can in some particular work—for instance, entry driving—where a few men succeed but a few men, but where we have 200 or 300 men employed we can not have a day shift and night shift. We can not do it in the mine nor at the tippie. We can not operate the tippie at night as we can in the day. It has been tried and found a sad failure. As a compromise (and I do not

believe in working anybody to death), I think a miner can and should work 9 hours a day. That would then give us a chance to run our works 10 hours, and the nature of the work there is not such as would wear a man out or work him too hard.

Q. (By Mr. PHILLIPS.) That would bar him from sunlight almost wholly, would it not, especially in the winter time?—A. That would depend upon what hours he went to work.

Q. And what of the sanitary conditions of the mine—smoke, etc.?—A. The sanitary conditions of the mines are so highly improved under our Pennsylvania mining law that the air furnished the miner must be of a certain quality and kind in the mine, regulated by men under the supervision of the mining inspector appointed by the State.

Q. (By Mr. C. J. HARRIS.) Would you say that miners were more unhealthy than other classes of people—those working in the mines?—A. In my experience, no.

Q. What have you to say in regard to the use of screens?—A. As to the laws on screens, I do not think that any State should undertake to legislate as to what screens should be used at any mine in the State. The conditions of the market control that. I will give you an example. In 1874 the legislature of Pennsylvania passed a law that coal should be screened over a three-quarter-inch screen. Our market had been furnished with an inch and a half screened coal prior to that. There was a heavy penalty. We put in three-quarter-inch screens and ran our coal that way until we gradually lost our markets; then simply violated the law by taking out our screens and putting back the inch and a half. In 1897 there was a law passed making it obligatory to weigh the coal before screening. The objection we have to that is that the miner in mining run of mine coal is not as careful in producing it as he is when he knows his coal is going to be screened. There is no incentive to do good work. He simply has to knock it down, because he gets as much for slack as lump. We want the lowest per cent of slack and offal. This law, by the way, was knocked out on the question of constitutionality by the Allegheny County court, sustained by the supreme court of Pennsylvania. It was unconstitutional because it took away from the parties the mutual right of contract; it made it obligatory to do it in that way only.

Q. Would you use a law abolishing the use of screens and making payments on run of mine entirely?—A. For the reasons just expressed, no. It would simply be the ruination of our business. I am speaking from experience. Before we appealed on that law—we had to, or the miners would not have worked—we took out the screens and ran run of mine coal, where we get under ordinary conditions 64 per cent of lump coal from the miners' product, and we ran down to as low as 55 and less per cent. This would simply result in winding up our business.

Q. We then come to cooperation, premium payments, profit sharing, industrial copartnership.—A. That has been tried in our region and has always resulted in failure.

Q. What are the effects of immigration on your industry in your district?—A. It has had no particular effect.

Q. Has it overcrowded the labor market to any marked extent?—A. No; only during the depression of business. When there was not the necessary demand for coal and the production was too great, of course there were too many mines and too many men.

Q. Could you suggest any regulation for immigration?—A. No; I go on the broad ground that, as in the past, when our forefathers—Irish, German, and others—came in here to a country that was set apart for the oppressed of all nations; it is open and should be open to all respectable people from foreign countries. I do not believe in bringing them in here under contract. They should come of their own free will to better their condition.

Q. What has been your experience with colored labor in the district?—A. As a rule, colored miners are not as good as white. The colored miner likes to play; he will not work on Saturday afternoon; he would rather dance than work. We have some who are very good fellows.

Q. Will he, in the same length of time, do as much work as the average white miner?—A. As a rule, no. We have exceptional cases of colored men where they are better than some whites. That is the exception.

Q. (By Mr. PHILLIPS.) In regard to non-English speaking labor, what effect has that?—A. I do not know of any. I do not see why they should not come in here, speaking their own language, learning ours as rapidly as they can. They soon find it is to their advantage to learn the language, and they soon do, as far as the mines are concerned.

Q. (By Mr. C. J. HARRIS.) Are they a more dangerous, difficult class to deal

with?—A. The raw element has shown itself a little in that way. They do not seem to quite understand or appreciate the conditions and liberties of this country, and I think until they do they will perhaps be a little harder to handle. We have had no experience in that way. I simply speak from what I have heard in different localities. We have a great many in the Pittsburgh field, our neighborhood.

Q. (By Mr. PHILLIPS.) And in the coke fields?—A. That is out of the Pittsburgh field. They have imported them, and I think have had trouble with them.

Q. (By Mr. FARQUHAR.) In case of a sufficiency of labor in your district, do you think it would be advisable to restrict immigration of those people?—A. No; I think this country is broad enough and long enough to hold a great many more. They ought to be made to move on. It is a pity they all settle in cities.

Q. If they were made to move on—go farther West—it would be at the expense, would it not, of the Government and States?—A. They should go at their own expense.

Q. Why should that class of immigrants be an expense to the Government when they are subjects of foreign governments?—A. They should not be, and they should not be foreign subjects. They should come here with the intention of remaining here and help make the American nation. I will say this for people of that class we have had for years, that the offspring, newer generations, grow up, as far as my experience goes, to become good American citizens. They will get out of the low, slovenly, filthy habits that their parents may have had.

Q. Was it your experience that before the alien contract labor law this country was flooded for years with hundreds of thousands of the most undesirable people of the whole world?—A. I think we had, at times.

Q. Under the old open-door system of inviting immigration, taking all that came?—A. Yes.

Q. You think that was detrimental to American civilization and workingmen?—A. It was, because that was brought about by importing them wholesale. I think if they had been let alone and come here of their own volition it would not have been so.

Q. You think the restrictions in respect to paupers, criminals, and everything of that kind would be sufficient; hard workers should be admitted?—A. I would not admit paupers, or idiots, or deformed people under any consideration; but I do not think we should close the door against people who have something to come on. I do not believe in importing them for any purposes, as has been done.

Q. (By Mr. C. J. HARRIS.) Have you anything to say on convict labor?—A. We have had no experience in convict labor, and from what I know, from information received, I would not be in favor of employing convicts in our mines.

Q. What do you say of the earnings of capital invested in your district now, as compared with when you first engaged in business, 30 years ago, say?—A. Then the trade was in its infancy and was not overdone. There was a chance of making something on your capital. I will say, without being specific, that in the coal business then, in the manner in which it was run, that 20 per cent on the investment was a fair average. Now it is anywhere from 15 down to nothing, and perhaps in some cases a loss beyond that of several per cent. I speak only of the Pittsburgh district, and you must remember the peculiar conditions that I have continually mentioned, overproduction and other things.

Q. Is not 15 per cent now as good as 20 per cent was in 1867, before the establishment of specie payment?—A. It would be; but I said 15 per cent down to nothing and worse. I venture to say that if the books of the Pittsburgh coal district were inspected for the year 1897 there would be shown a loss.

Q. (By Mr. FARQUHAR.) How do you account for that?—A. Overproduction, undue advantages some had in the same district and other districts. We were hurt largely by West Virginia, and within ourselves. It was outward competition and the competition against one another. Just consider the statement made before this investigation committee that was appointed by the legislature of Pennsylvania, that a concern with a capital of \$1,000,000, running 1,000,000 to 1,200,000 tons of coal, made \$8,000 in one year, which is next to nothing. This is a fair sample of what the business has been, and shows a deplorable condition.

Q. As a general thing in your district are operators the owners of the land itself?—A. They are in most cases, and that is one of the disadvantages we labor under. If they could take coal on a royalty and pay for it as they mined it, it would be better. For instance, we have had to protect our coal mines, have been obliged to buy two or more thousand acres of coal land at an enormous outlay that we will not reach in 20 years. We are driven to that for fear someone may come in and buy that and cut us off and make our plant worthless. If we could mine coal on a royalty, as they do in England, and pay for it as we take it out, we could make money.

Q. So that the general view taken by the coal operators is that simply it is not the mine and all the attachments of the mine itself that is the cost of the investment, but there is added to that the purchase of adjoining land and the protection of the property?—A. Certainly; it is a legitimate part of it.

Q. (By C. J. HARRIS.) Is there any restrictive or industrial legislation which affects you injuriously?—A. I know of none now since the abolition of this law. There is none in existence now that I know of.

Q. (By Mr. FARQUHAR.) Is there any way to obviate this friction in respect to the screens?—A. There is no way that I know of, and I do not think there should be a way. Speaking of the Pittsburgh district, I think we should be permitted to make the price for certain grade of coal with our men, pay them that and then screen it to that without the State or any other parties interfering. Any interference there would cause disaster to the operator, and it would follow and reach the miner. I think the miner is just a little too sensitive on the screen question, admitting, of course, that he is being taken advantage of in certain individual cases; no more, however, than employees are taken advantage of in any other industry or manufacture or commercial business. In the central part of Pennsylvania they have a coal that is softer than ours. It is all run as run-of-mine, because they need not get lumps, and it comes into the market and is readily taken in that way; but our coal is not taken that way, and there can be no successful interference with those screens.

Q. (By Mr. RATCHFORD.) Do you believe that the miner should be paid directly for all products of his labor having a commercial value?—A. I believe, I know, that we are paying the miner for all parts of his labor. The fact that we pay him 42½ cents only for run-of-mine and pay him 66 cents for the screened coal demonstrates by calculation, experience, and investigation that he is being paid in a proper ratio for all coal.

Q. Is it a fact that where the screens have been abolished by mutual consent he has waived enough of his price to equal the amount of screenings passing through the screens and given that back to the operator?—A. I do not know of any such cases in our district as you speak of; I have no experience in that way.

Q. Do you know of it in Illinois?—A. The conditions there are different. The Illinois coal is perhaps of the same grade of coal, as far as I know, as the Eastern coal that I speak of, and the natural conditions and the artificial conditions are such that that coal can be marketed in that condition. I think that is the situation in Illinois.

Q. Is it a fact that the right to screen the miners' coal is a right gained by strikes?—A. So they tell me; that goes beyond my experience. When I entered the coal business we were screening without any more question about it than now; not so much. I am told that in the early days of the Pittsburgh district each mine took it as it came from the miner, and I am very sorry that it did not continue, because in my experience I remember that we brought it from the mine and dumped it in the yard as we took it from the mine. Competition coming in, an idiot (excuse me if I call him an idiot) introduced a fork with a 2-inch prong and forked all this coal, throwing out all the slack, and the result was that we all had to enter into that; and I imagine the screens that were introduced were simply to enable somebody to get somebody else's trade. That is all of 50 or more years standing. People are accustomed to that coal in the Pittsburgh district and no other will go. I have cited two cases in which the law tried to regulate them.

Q. In the past 2 years have there been some cases in the Pittsburgh district where screens have been introduced as the result of strikes, in which the prices paid for screenings or coal over such screens were determined by the employers, as well as the system of screening itself?—A. There may have been such cases; unless you call my attention to them particularly, I do not know of them.

Q. Do the operators pay for the refuse that passes through their screens, and is the fact that the miners to-day are willing to relinquish a portion of their price to go back to the run-of-mine system a proof that they have received the excess portion when the screen was planed out?—A. They want to come back now because in mining run-of-mine coal they take no care; they chop it down; it requires no skill; anybody can do it, and they get just as much for the dirt as they do for the coal. In mining coal that has to be passed over a screen they have to exercise a certain amount or degree of skill in order that their coal may not be broken up so that it may come through the screen. We want that kind of coal. Our experience has been, notably under the law of 1897, where we were forced into it for 3 months, that on coal mined on the system of run-of-mine we lost all the way from 5 to 10 per cent in the quality of the coal; that is, where we were entitled to 64 per cent of coal we ran down to 55.

Q. Do you agree that the contention of the miners has been that the screen that

is now in use has a tendency to, and does in fact, place a premium upon a poor standard of workmanship?—A. Yes.

Q. Will you explain why the miners so contend?—A. I claim that that does not work out. The man who is a skilled and careful miner will mine his coal and he will produce in that a large per cent of lump, and he will get paid for it. If he is not careful, he will produce less and make less money. Is not the incentive to earn good wages there? Is it not just as easy for a skilled miner or any miner to mine good coal as bad coal, always exercising the proper care? We ask that simply to guard us against the carelessness and cussedness of some people. They are not all of them that way, but some of our employees are.

Q. Take two miners, one who is more careful and practical than the other. The first will make a less percentage of slack and nut coal in the production of a ton of coal; the latter will make a greater percentage. Which of those men to-day, under the screen system, is more profitable to the operator?—A. We want the man that produces good coal. That is why we stick to the screen system.

Q. Can you explain why, in view of the fact that the screenings in a ton of coal passing through your screen is given to the operator without pay—A. (Interrupting.) I do not admit that; it is not. We find that on an average a ton of run-of-mine coal will make 64 per cent of lump and the remainder nut and slack. We pay for that 64 per cent 66 cents per ton. Based upon that same percentage we find, when he has run-of-mine, that he is entitled to 42½ cents for the nut, slack, and lump.

Q. Is it a fact that the coal operators of the States generally are all causing their miners to send out all of their fine coal more generally than ever before?—A. Speaking for ourselves, and speaking for the entire industry of the United States, I can say that we are bringing out about all the coal that can be mined, from the limestone up to the slate.

Q. The fine coal?—A. Everything as it is there. In the early days, when coal was mined by the pick exclusively, the miner bored in about 24 or 28 inches above the limestone, and he left 10 to 12 inches that we then considered not merchantable coal. By the introduction of machinery we mine in on the limestone and we cut up that lower bottom into slack; that is, what we formerly wasted. Instead of waste we now mine all of that coal; and therefore, by the introduction of machinery, we claim to-day that we get out 95 per cent of all the coal underlying the land, where in the earlier days of the Pittsburgh industry they did not get out above 60 per cent, and we make it obligatory to bring out everything in there, because it is of value aside from the commercial value in the market. I consider it a crime against the present generation and those who will follow us to waste that, because it is a loss even if we ourselves do not feel it.

Q. The point is, that under the former system, when there was no screen used, or, if any, a very small one to let slack out, that the employer in those days did not want slack sent out; did not want the fine material sent out among the coal; but under our screening system they want it all. every pound of coal as fine as it may be.—A. Under improved methods and in the use of improved machinery and boilers practically in all factories employed in the manufacture of iron, steel, glass, etc., people are able to use a grade of coal that 15 years ago they would not use. We wasted all this slack, and it was an expense to us to bring it out. It cost us so much for every ton we brought out to throw it away; but under these improved methods of modern machinery there is a market for it. They want it. We pay for it and we sell it.

Q. (By Mr. SMYTH.) You pay for it on the basis of 42½ cents?—A. Forty-two and two-thirds to 66, the difference would be 23½.

Q. (By Mr. FARQUHAR.) The invention of the forced draft has a great deal to do with it?—A. That has much to do with it; and automatic stokers require that grade of coal.

Q. (By Mr. RATCHFORD.) What have you to say about the question of discriminations in freight rates?—A. That is more or less general, and that is something that I am not able to give testimony on as to what I know. I can only tell you what I think. I have never in my experience been able to run across anybody that knew anything on it. Wherever it is done it is done in such a peculiar manner that while we know it we do not know how it is done. We are certainly discriminated against, we think, in our own locality, and principally from West Virginia—hauling coal quite a distance greater than ours; for the distance certainly is in excess of ours in our trade for the Lakes; and they have no back load, while we do, in the Pittsburgh district, furnish them a back load in the way of limestone, ores, etc. In Ohio, in the Hocking district, or from the Ohio fields, they haul coal into the competitive market of the Northwest, a greater distance than from Pittsburgh, for less money and with no back load; and we in the Pitts-

burg district invariably have a back load. That back load will also apply to operations in parts of eastern Ohio as well as the Pittsburgh district. But in the Pittsburgh district it is altogether so. In the Hocking Valley that is not the case.

Q. You regard discrimination as injurious to the trade wherever it is practiced?—A. Decidedly so. There ought to be an open rate and give every man an open and fair chance.

Q. Do you believe that the rate of freight should be fixed by the State or by the companies themselves?—A. I do not believe in the State assuming too much. A time may come hereafter when the State can do that. Under present conditions I think the railroads had better make those rates. They should, however, in a manner be controlled.

Q. (By Mr. C. J. HARRIS.) Do you use machinery, or mine by picks?—A. We use machinery almost exclusively. We were among the earliest users; have been using machines for the last 15 years.

Q. Give your reason for preferring them.—A. Machines were originally introduced into our mines for the reason that they would be more profitable, and they were. There was a time in the early days when there was an advantage to the operator that used machines of perhaps 15 cents a ton, even after counting out interest on his investment, depreciation, etc., but that has got down now to about 8 cents a ton. That is, the operator can produce coal at a cost of 8 cents per ton less with the machines than he can by pick, but it has long since been discounted by reason of overproduction and crowding one another. That has been given away to the consumer, the man that does not want it. It has been forced upon him. I think one of the greatest crimes perpetrated in this country is right in our Pittsburgh district, where we are wasting one of the finest veins of coal on earth. We are forcing it upon people for nothing.

Q. (By Mr. RATCHFORD.) Have you anything to say of the displacement of labor by machinery?—A. The mining machine we use can be run with a cutter and an assistant, called a scraper, and 4 loaders. The machine does in mining only the undercutting, what the miner calls the bearing-in, the full width of the room and perhaps to a depth of 5 feet. That was heretofore done by the miner with his pick. That we consider, in general terms, half the work. The scraper assists him in removing the slack the machine makes, the loaders come after and shoot down the coal and load it. So that 6 men do the work of 10 under the old system. That is about a fair average.

Q. (By Mr. C. J. HARRIS.) Is there no way to remedy this displacement of labor by the use of the machines?—A. There has not been so much trouble in that way, the industry has grown so. We have in the last 10 years built up a trade in the Northwest that last year took 4,000,000 tons, that I remember 12 years ago amounted to perhaps from 5 to 10 cars a day from one mine. Now all the mines in the district are employed in that during seasons of lake navigation, caused by the building up of the Northwest, creating markets for our coal.

Q. (By Mr. RATCHFORD.) Has not the injury been felt in the way of a less number of days per year?—A. I do not think that should be laid to machinery.

Q. Has machinery been a factor in bringing it about?—A. No, not exactly. The people have labored under a delusion that there was a great deal of money in the coal business; that while in England to-day it takes an enormous amount of capital to go into the coal business because you have to dig a shaft there, anybody can go into the coal business in the Pittsburgh district because you have only to dig a hole in the ground and you can make the approaches and bring up the coal; and it has brought about too many mines. It has led miners from other localities into that district that should not have gone there. Less mines could have produced coal with less men. When there was not anything to do in other lines of industry, men have flocked in there who should have been at something else. I do not think that machinery has cut much of a figure in taking work from the men. You will bear in mind that with the introduction of machinery we created new places, engineers, firemen, etc. It is surprising. You would think that a machine mine had no men about it at all, and yet you go to a machine mine and you will find very little difference between that and the pick mine. We produce more coal.

Q. What proportion of the tonnage at Pittsburgh is mined by machinery?—A. I do not know exactly, but there are very few pick mines left in the Pittsburgh district.

Q. Are you of the opinion that if those machines ceased to operate that the miners in that district could have work a greater number of days than they are working at present?—A. No; I do not exactly see how they could.

Q. You have stated that 6 men with a machine will do the work of 10 formerly?—A. If you will apply that to the entire country. If you apply it to the Pittsburgh district, it don't go.

Q. I assume that what is true of the Pittsburg district is true of all.—A. You apply that to the whole country. Of course we have displaced very many men.

Q. To what extent have substitutes for fuel displaced coal-mine labor—electricity, gas, and other substitutes?—A. At one time gas took from us, I may say, the entire consumption of coal of the Pittsburg district, but that has changed. Gas has become a luxury. It is only used by people who can afford to use it. Coal is again used and labor is not interfered with.

Q. Have you anything to say as to the extension of foreign markets?—A. I think we will be driven into foreign markets with our coal as we have been driven into foreign markets with our products of iron and steel and glass. And there is no reason in the world why the Pittsburg coal could not go to New Orleans and from there be distributed along the coast—places within easy reach—to Mexican and South American points.

Q. (By Mr. FARQUHAR.) What nation at the present time furnishes coal for the east coast of South America?—A. England.

Q. All Welsh coal?—A. I think so.

Q. Did they not have that market exclusively up to 10 years ago?—A. They almost have it now. I think the fact of our Government exporting coal for our own use will help to introduce our coal. I claim we have as good coal as they have. We simply want somebody to push it, and we will get foreign markets, as far as coal is concerned, before long.

Q. Do you know of any shipments going to South and Central America now?—A. I do not, but there may be coal from Alabama or the Pocahontas district, but I do not know.

Q. (By Mr. RATCHFORD.) What have you to say of remedial legislation?—A. With reference to employers' liability, the day may come when the employer or somebody will be taxed, or have to pay taxes for the benefit of the employee. I do not think we are quite ready for that yet, and I think the State of Pennsylvania is making a great mistake in trying to pass a bill at present making employers of labor liable. As far as the coal industry is concerned, under our mining law, governing the entire bituminous region of Pennsylvania, we are under the supervision of the State. We have mine inspectors there who are controlled by the chief of the bureau of mines in Harrisburg. We have mine foremen who are officers of the State, but are under the immediate supervision of the inspector and are held accountable for the lives and safety of the miners. We have under them special bosses, known as fire bosses, who look after the welfare of the men in particular, such as examining the mine for gases, bad roofs, etc. So that where we do not employ the particular persons duly certified by the State, and where they do not exercise proper care, we, as coal operators, are liable; and I think for the time being that is about as much as we can afford. On the other hand, I think that the time is near at hand when there should be more provision made for the laboring classes in some way. I am not clear in my own mind how that should be. They are provided for in Germany. We have associations in a local way; we do that. We have benefit associations at our mines to which the company pays some attention, made up by contributions from the miners, that take care of them. There ought to be something more than that, but I have no suggestions to make as to what it should be.

Q. (By Mr. SMYTH.) Are you aware of the effect of the employers' liability act in England on the trade?—A. Not enough to talk of it intelligently.

Q. Have they such an act that affects the coal miner?—A. I think the miners are cared for and protected in some way there.

The sanitary and personal-safety laws are covered by our mine-inspection laws. Check weighmen laws: There ought to be on each tippie, or where the coal is loaded, a check weighman to look after the miners' interests. I believe, with few exceptions, in the Pittsburg district we have them. They should be under a little closer supervision, so as to make them more careful and rigid in the exercise of their duties. I do not at all believe that the State has the right to place them there—neither the State nor the miners. I do not think the miners have that desire; they have not shown it; that is, should have the right to place anyone there who would interfere with the successful running of the mine. The operator would not permit it and has not been asked.

Q. Have you anything to say on the uniformity of mining legislation in the several States and Territories?—A. I think there should be uniformity as nearly as can be. I do not think we can have perfect uniformity between the competitive States, but they should be uniform, as near as can be, in their mining laws, which I think for the time being is enough.

Q. (By Mr. FARQUHAR.) In your conferences of operators has this matter of uniform legislation in the States ever been considered independent of production

and wages, etc.?—A. Not in our interstate conferences. It is merely upon mutual agreement that conditions have been taken in various States and so modified that one would suit the other.

Q. Do you think it would meet their approbation if this commission were to make recommendations for the uniformity of the mining laws?—A. That is rather a broad question. I think yes.

Q. If, after all our findings and going over the whole ground, we find some matter that would be thoroughly a relief—beneficial, in fact, to both the operators and the miners—do you believe that the cooperation of the operative miners of this country could be sought or gained by this commission in going before local legislatures?—A. I do, for general legislation—that is, for United States legislation, governing all the States. I think that this commission is a proper thing; is a great thing; is on a good and proper road; will bring out a great deal of information, and will be able to make some suggestions that I think all well-thinking operators and miners will readily fall in with—that is, such suggestions as can be made by them. They can only be made on a broad, fair basis, and I do not see why they should not receive proper consideration.

Q. (By Mr. PHILLIPS.) Have you in mind any remedial legislation that would be fair both to the employer and employee that does not now exist?—A. I have not, because I am not thoroughly enough acquainted with the evils existing in different States that could be reached by legislation.

Q. (By Mr. FARQUHAR.) Do you think, taking a broad view of the question, that you also serve your own interests by what you do for the improvement of the conditions of the workmen under you, and that there would be a benefit to you, as well as them, to have such legislation?—A. I believe it would be.

Q. Is there not enough fairness in the operators of this country to receive and consider suggestions that might be agitated for remedial legislation, or are you in a competitive mood there?—A. More or less so; but we are getting nearer together—are nearer together—than we were a few years ago, and I think that is the tendency of the times. As we become acquainted with one another, as we find the ills that others have, find that we have not the only difficulties, we feel like sort of mollifying one another and evening up, and in that spirit good results can be reached.

Q. (By Mr. RATCHFORD.) In your judgment, are the best interests of the mining trade served—when I say the trade, I mean those engaged in the trade from every standpoint—by making the conditions as nearly uniform as possible and placing all competitors, so far as possible, upon a relative competitive basis?—A. Laying aside all selfish views, and on the broad ground of fairness, yes.

STATE OF PENNSYLVANIA, *County of Allegheny*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

GEO. W. SCHLUEDERBERG.

Sworn and subscribed before me this 29th day of June, 1899.

[SEAL.]

R. A. GEORGE,
Notary Public.

WASHINGTON, D. C., *April 13, 1899.*

TESTIMONY OF W. C. PEARCE,

Secretary and Treasurer, United Mine Workers of America.

The commission met at 10.30 a. m., Vice-chairman Phillips presiding. Mr. W. C. Pearce, of Indianapolis, Ind., testified. The topical plan of inquiry on mining was followed.

Q. (By Mr. C. J. HARRIS.) What is your official position?—A. Secretary and treasurer of the United Mine Workers of America.

Q. From what mining State were you originally?—A. Ohio.

Q. How long have you been connected with the coal-mining industry?—A. As a miner, all my life; since I was a boy; brought up in mining.

Q. What are the objects of your association?—A. To secure better wages for employment, shorten the hours of labor, and make the conditions of employment more agreeable. I think those are the objects of our trade union.

Q. Are there any benefit features connected with your organization?—A. No. We have a fund, of course, which we try to keep for running expenses. We have no benefit funds of a national character. Locally some of our members have a fund, an accident fund, or funeral benefit fund. It is only local; not of a general character. Our money for running the organization is derived from our members—10 cents per member per month. We use that money principally for paying organizers, officers' expenses, and trying to adjust difficulties and troubles here and there.

Q. What have you to say in regard to the increase of trade unionism in this country?—A. The first organization of miners that I have any recollection of was the Knights of Labor, years ago. In 1881, I think, there was formed in Ohio a progressive union. It was thought by some of the miners that while the Knights of Labor was a purely labor organization, that a trade union would be better for miners than to be affiliated with other trades; and we favored a purely miners' organization in 1881 in Ohio. That spread. For a few years we had a membership in Ohio of probably five or six thousand. In 1890 there was formed the United Mine Workers of America, a national organization of mine workers alone. Since that time the membership has varied, sometimes we had more members; sometimes less; it would run anywhere from seven, probably, to twenty-two or twenty-three thousand. Up until 1897 that was the membership that we had, and after the 1897 strike we gained a little advance in wages, consequently, our membership increased and is increasing yet. We have now nearly 60,000 members enrolled in our organization. The growth, of course, is phenomenal in that respect, and if the organization is managed in a conservative way by the officers in power, we believe we will soon have quite a trade union of miners in this country.

Q. (By Mr. RATCHFORD.) Is the increase in the membership of the organization due to an improvement in industrial conditions, or is it due to the methods of organization?—A. I should say that, in my judgment, it is due to the success, principally, of the 1897 strike. I think during the last two years fully 20 per cent advance in wages has been gained. That, of course, has stimulated the miners to affiliate themselves with our trade union. I would like to say in regard to the statement about the 60,000 members enrolled in our trade union (men in our organization proper), that while we have that many enrolled, it is safe to say that we have probably 15,000 or 20,000 more members. I only state from the books. Sometimes if there are 200 men working at the mine they probably send tax for 150 or 175 members. The others are not reported. It is safe to say that while we have that many enrolled we have 15,000 or 20,000 men who are not paying per capita tax. When the mine is idle, when men are on strike, or when the mine is shut down, we do not expect them to pay a per capita tax.

Q. (By Mr. PHILLIPS.) Was there any understanding, compact, or agreement between your organization and the persons engaged in the coal industry, capitalists and corporations, in regard to that strike?—A. No; there was no understanding between the organization and capitalists or operators that I know of.

Q. (By Mr. RATCHFORD.) Did capitalists or employers receive any notice of that strike in advance?—A. No. I remember the time of the 1897 strike as well as yesterday. They always tried to find these things out previously, but the circular ordering the strike was published and in the hands of our local secretaries before the newspapers got it at Columbus, Ohio, where the headquarters were at that time.

Q. What was, as nearly as you can state, the membership in good standing in your organization when that strike order went out?—A. Ten thousand six hundred and seventy-eight members.

Q. And what was the total number that responded to the strike order?—A. The total number, I think, was nearly 150,000.

Q. The great bulk of the men who took part in that strike had nothing to do with bringing about the strike order, did they or not?—A. The great bulk of the men who took part in our strike had nothing to do with bringing it about; for instance, in 1897 we had nearly 26,000 miners and mine workers in the State of Ohio; we had only 7,697 men organized. Pennsylvania, with 250,675 miners, had only 1,976 organized men on our books. Indiana, with 9,000 miners and mine workers, had only 626 men organized.

Q. That is how many?—A. Eight or nine thousand men. Illinois was a great drawback to the organization. Statistics will show 38,000 or 39,000 mine workers in Illinois when we ordered that strike, and at that time we only had 226 members. In Iowa we had only 79 members; West Virginia, 75 members. This proved conclusively that the majority of the miners who came out in that strike had nothing to do with bringing the strike about.

Q. (By Representative GARDNER.) I understood the witness to say that they

have 65,000 miners, more or less, enrolled, and some 20,000 more that they control. Is that control entirely voluntary; that is to say, men are in the organization or out of it, and there is no intermediate stage in which persons not members are still under obligations to this order?—A. No; they are either in or out.

Q. (By Mr. RATCHFORD.) Is there any course or method used in the control of them, or is their action in the respect which you have pointed out purely voluntary; is it the influence of the action of the organized miners of the country that extends into the unorganized fields, upon which unorganized men go of their own volition?—A. Yes; I can state that, to my knowledge, in 10 years' experience as an official there has never been any method used to bring men on a strike through coercion or force; never.

Q. (By Mr. C. J. HARRIS.) Is your union incorporated?—A. No.

Q. Have you anything to say in regard to incorporation of trade unions—whether advisable or not?—A. No. I have no particular objection to the incorporation, and I have given the question much study.

Q. What have you to say of your relations with nonunion labor and the right of the individual to liberty of contract?—A. Our relation to nonunion labor, as far as miners are concerned, is first conciliatory; we try to reason with them; we send organizers of our men to talk with them—missionaries, if you please. We try to show them that it is necessary for them to be affiliated with other trade unions, from our standpoint at least, and we persuade them along these lines. And, of course, if they do not affiliate with our organization, as I said a few moments ago, we use no force, but we simply do not pay as much attention to them in regard to their prices or wages or conditions of employment as we would do were they members of our organization.

Q. Do you, in some cases, refuse to work with nonunion laborers? Has that been done in some isolated cases?—A. Yes. Some of our members refused to work with a man or men who refused to become members of our organization.

Q. (By Mr. FARQUHAR.) Does your organization invite all unemployed and nonunion labor—that is, competitive labor—men of good moral character, to join your ranks?—A. Yes. Our doors are always open and no questions asked.

Q. It is the purpose of your field organizers to bring as many as possible into the organization and under the regulations of the union?—A. Yes.

Q. (By Mr. RATCHFORD.) Is the refusal to work with nonunion labor a common practice of your union or not?—A. No; it is not a common practice.

Q. The local union sometimes usurps that right?—A. Yes.

Q. (By Mr. FARQUHAR.) When a man has once taken the pledge before the union and has broken his honor, do you positively refuse to work with him?—A. No; if he breaks his pledge, and wishes to come back, he is accepted and added as a member again.

Q. (By Mr. C. J. HARRIS.) Can you enumerate the causes that generally lead to strikes?—A. There are different causes, of course. The principal causes which lead to strikes, of a national character at least, are either to prevent a reduction of wages or demands for an increased wage. The wage question is a factor which causes nearly all of our national strikes—demands for increased wages or resistance to reductions; and sometimes strikes of a lesser magnitude are caused by dissatisfaction with conditions of employment. Conditions of employment around the mines is an important factor for a miner; for instance, in the bowels of the earth, in order to sustain life, enable him to perform his duties, he must have air; he can not work with any degree of satisfaction in a place where there is water that would interfere. Sometimes sufficient supply of timber or material for safety is lacking, and sometimes these things cause dissatisfaction, and men strike sometimes because the conditions of employment are not as they should be or as they think they should be. I am pleased, however, to say to the commission that as far as air, and the timber, and that sort of thing are concerned, we have not had so much trouble within recent years as we had formerly, as some of the mining States have laws which say so and so shall be done, and inspectors come around and see that it is right. Strikes from these causes very seldom occur now.

Q. Do strikes arise sometimes from an overproduction of coal, the market being glutted and prices going down, so they can not pay the miner his wages, and then the strike is called, so that this overproduction may be made an argument in that way?—A. I do not think there has been a strike directly caused by the markets being glutted, or, in other words, an overproduction of coal, alone.

Q. (By Mr. RATCHFORD.) While that may not be the true cause, is it not the underlying cause of some strikes and troubles in the mining industry?—A. Yes. My answer a few minutes ago was, directly; indirectly it does. There are times in this country when the market has an abundance of coal. For a time at least

there is very little demand for coal, and in order to keep the mines in operation our employers sometimes say, "We have not any particular sale; we have all the coal we want; but if you men will work I can give you work at 5 or 10 cents a ton less than the scale rate; if you will accept that, it is all right." And sometimes strikes are caused by the operators trying to reduce wages in that way, from the fact that they have an overproduction in the market.

Q. What have the screens and docking system to do with strikes?—A. I might have mentioned that among some of the local conditions that caused strikes. The screens cause a great deal of trouble. Our coal is mined by us as miners and we are paid for the coal that goes over a screen. The screen is generally 72 superficial feet, 12 by 6, with $1\frac{1}{2}$ -inch space between the bars. What goes through that $1\frac{1}{2}$ -inch space the miner gets nothing for, but what goes over the screen they get paid for. Sometimes these bars will be disarranged; there will something happen that will weaken, as it were, the bearings, and the bars will open, spread, and instead of the space being $1\frac{1}{2}$ inches, it is sometimes 2 inches and over, and of course the wider the screens the more goes through and the less for the miner. Sometimes they have a good deal of trouble with the companies, or with their agents at least, in getting these screens put in order, and oftentimes the miners in different localities strike; that is, these men will remain idle until that work is adjusted. They often have to stop work before the companies will put them in shape. Now, with reference to docking particularly, docking is a great deal of trouble where the coal is more inferior in quality. Even when the miners do their very best, in some cases they have been docked five or ten hundred pounds, and sometimes a ton. That, of course, is unbearable.

Q. (By Representative GARDNER.) What do you mean—the impurities?—A. Yes; sulphur. There is a vein of coal in Ohio 8 feet high, and in that 8 feet there are 3 feet and 10 inches of impurities. There are 2 feet of good coal, and above that there are two slates. Of course that coal is not marketable. It is what we call bone coal—a coarse, rough, hard substance. It is mixed all through the coal. The miner picks up all the best, and often after he has all the impurities out a little will get in the shovel and they are docked as high—sometimes the whole car is taken. This extreme docking is done more when work is slack—when the company has not so many orders.

Q. I understood you to say the bars were $1\frac{1}{2}$ inch. Would not that admit of the dropping through of a great deal of coal sold on the market as pea coal?—A. Yes; and the softer the coal is, the more small coal there is in it, and the more goes through the screen. I am not familiar exactly with the percentages in the different States, but there are some where 30, 35, or 40 per cent of their coal goes through the screen; some cases more, some cases less.

Q. Do you get any pay for that at all?—A. No. The nut and pea coal goes through the screen. For instance, miners in the Hocking Valley gets 66 cents a ton for screened coal; they only get that 66 cents for a ton of coal that goes over the screen; what goes through the screen they do not get anything for.

Q. That would include their product that is sold as pea coal?—A. Yes; nut and pea coal.

Q. What method is adopted for keeping those screens clean?—A. They have a process for keeping them clean. The companies have men and boys there. When they get clogged up they are cleaned.

Q. It is to the interest of the company to keep them open.—A. Yes.

Q. (By Mr. FARQUHAR.) Is not your rate for mining coal by screen enlarged on the part of the proprietors to meet some of the disadvantages you get no pay for?—A. There are two prices. There is what is known as a price for screened coal and a price for run-of-mine. Run-of-mine is all together, small and large. In Ohio it is five-sevenths of the price.

Q. (By Mr. C. J. HARRIS.) The price of run-of-mine is 43 cents; the screened coal, 66 cents.—A. Yes.

Q. (By Representative GARDNER.) So that, theoretically, the coal that falls through the screen is paid for by the increase in price for that which goes over.—A. Theoretically, yes; that is, by the system under which we are working now.

Q. What is the reason for having a screen at all? Why not separate it right there in the mines?—A. The companies have the screens there for separation. It prepares the coal better for the market. It is more economical to separate it when it comes out of the mine. A few years ago, when mining was in its infancy, so to speak, in this country, they used to compel the miners to load coal with a forked shovel instead of having a shovel like they have to-day. They used to have a forked shovel with four or five prongs to it; what that fork brought out was allowed, and what that fork did not bring out the miner threw away; but since that time the screen has been put on the outside, and the miner loads it all.

Q. (By Mr. C. J. HARRIS.) The high-priced product is the screened product of the mine?—A. Yes.

Q. What would be the difference in the price at the mine between screened product and slack?—A. The slack is always the most inferior coal.

Q. I mean screened?—A. I met a retail coal dealer in Sandusky, Ohio, who purchased his coal directly from the Hocking Valley operators. At that time I lived down there. I asked him the price of coal and he told me that the screened coal or lump coal sold for \$2.50 a ton in Sandusky; but he said for the small coal, or the crushed coal, as we call it—little pieces about the size of eggs—he got \$2.75. He said people that bought this small coal would rather take it because it was all broken up; they pay 25 cents extra because it is broken up. This is the coal that goes through the screen—nut coal. At Sandusky, Ohio, they pay 25 cents more for that than for lump coal.

Q. Are you aware that at the mine the screened coal is one price and the refuse that goes through the screens is worth about one-sixth of that price? That is the rule in Tennessee mines; I do not know about Ohio.—A. I think they get \$1 a ton on the car f. o. b. for the screened coal; 75 cents for the nut coal, and the smaller it is, the less for it. I do not think there is much difference, more than 25 cents, between the screened and nut; there may be 50 cents between that and pea coal.

Q. (By Mr. FARQUHAR.) Is there a large market for nut coal now?—A. Seemingly. They sell it right along.

Q. (By Mr. C. J. HARRIS.) The screened product being the highest, it is to the interest of every mine to turn out as much screened coal as possible.—A. The idea, in some cases, is that the company wants as much coal to go through the screen as possibly can. Of course, it stands to reason, from looking at it by a man who is inexperienced, the better coal he can put into the market the better prices he will get for it; but the more that goes through the screen the more profit they get.

Q. (By Representative GARDNER.) If the first grade of coal is selling at 75 cents a ton more than the next grade, the mining price being 66 cents a ton, every ton of coal that would go into the first grade and drop through into the second is a loss of 9 cents to the company.—A. What goes through the screen is divided into three different grades.

Q. (By Mr. RATCHFORD.) Is it a fact that the proposition that Mr. Gardner lays down is positively correct, providing the employer pays the same rate for mining all classes of coal?—A. Yes; if they did that.

Q. Is it the contention of your organization that they should pay the same price for mining the coal, or is it your contention that they should pay enough for mining coal that falls through the screen?—A. That is the contention. All mining is based on the screen basis.

Q. (By Representative GARDNER.) I assume that the market has a price for first grade, and that the first grade must come up to some standard. Is that standard the 14-inch screen?—A. That is the standard.

Q. (By Mr. C. J. HARRIS.) Unless you had these screens, would not operators be damaged on account of getting so much of their product in dirty, small, and dusty condition—what you call slack?—A. The entire State of Illinois is on a run-of-mine basis, operators and miners alike agreeing that it is an improvement on the old system of screening. The impurities we might think men would be careless in loading, simply saying, "I will get pay for this and I will load it"—that does not prove that men do it. The very fact that there are rules and regulations, local agreements entered into by miners and their respective employers, demonstrates beyond any doubt whatever that the miner does not load any impurities willfully, and that it does not interfere with the marketing of the coal when it is mined run-of-mine.

Q. What check would an operator or owner have on a miner if he should dump into the product two-thirds worthless stuff, under the run-of-mine payment?—A. One instance to my personal knowledge was where the miners themselves regarded the loading of worthless coal as injurious to them, and they said that while that man was loading dirty coal he was not only injuring the company but depriving them of work, and we did ourselves one time discharge a man for mining dirty coal. The majority of the miners will not load dirty coal.

Q. Would that be a business formula to go by? Would it be as standard a regulation as the screen, or as efficient?—A. While the screen takes out this slack and the small pieces, you know that in the market what injures the coal is not so much the slack that is in it, but the big pieces of sulphur. That is what interferes with the marketing of the coal; and those big pieces of sulphur are generally in the big pieces of coal. You can see them shining out. The screens were on the mines before my time, of course; I have worked in the mines over the screens.

I have no doubt in the world but what it was brought about by conquest, strikes, years and years ago; established a precedent—one little screen—then their use increased and increased until it is the way it is now. If there could be some way or other to regulate the screens, it seems to me that 50 to 75 per cent of the troubles between the miners and operators in this country can be avoided.

Q. Would the absence of the screens do away with the difference that now exists between the skilled and unskilled miners?—A. As a practical miner, I think it is necessary that the coal should be graded some way. You can not go into the coal market and sell an inferior coal and bring the best price. You can not go to the markets, in a commercial sense, with any products but what there are different kinds and prices. It seems to me that coal, like any other commodity, will have to be trimmed up in such way as to be made marketable.

Q. Suppose one miner is skillful, and his product for the day shows 65 per cent of screened coal; suppose the man working beside him gets out the same number of tons, but in such a shiftless way that 50 per cent of it is screenings. With the run-of-mine scale they would both receive the same wages. Would that be a fair proposition with the laboring man?—A. Mining ought to be, whether it is or not, worked like any other business. The very fact that there are so many unskilled miners is due principally to the operators themselves. Some of the States have laws that a man must have two years' experience before he can have charge of a room or place in the mines, but recently, you know, for years, any Tom, Dick, or Harry, with a broad back, who could use a pick and shovel, has been employed.

Q. Would not the screen be an advantage to the skilled miner?—A. That would depend upon the prices of mining.

Q. (By Mr. FARQUHAR.) What do you think is the general opinion of your union in all the States as to whether it is better to go to 43 cents for run-of-mine or 66 cents for screened, as an ordinary basis?—A. Well, that matter has never been brought up in our convention. Of course I would not care to speak personally on this important question. When I spoke of the five-sevenths I was speaking of the Hocking Valley. There was a test made at one time in this way: A certain number of tons of coal was mined, sent over a screen; a certain amount was mined and not screened—that is, run-of-mine. This was years ago, and the test showed that in the Hocking Valley it ran five-sevenths, and the price of mining was based on that test. Since that time machines have been introduced. There is not near so much slack in the harder coal as there used to be. The miners contend that a thing established years ago is hardly fair under the new order of things.

Q. Is it the contention of your unions to have the abolition of the screens as far as you can?—A. Yes.

Q. Have you attempted that through legislation?—A. Yes.

Q. What has been the result?—A. Where it has been passed by the State legislatures, I think in one case it was declared unconstitutional. In Illinois they had a law passed a year or two ago. The miners and operators agreed to try it, and have been trying it. There was a law passed at the last session of the legislature in Ohio. I understand that the operators in that State are contending against it and will bring it into the court. The operators claim that it is unconstitutional, and the miners, of course, that it is not.

Q. Is it a fact that in all the States they are declared unconstitutional whenever they have come to the test of the courts?—A. Yes; to my knowledge they have.

Q. Are you aware of the usual reasons given by the courts for making these decisions?—A. Only that it interferes with the right of individual contract, or something of that kind.

Q. Are you aware that there is no remedy in legislation unless you can prove a fraud in the screen?—A. I would suppose you would have to prove something.

Q. That that is the only remedy now, except through a conference between the owners of mines and your body, generally understood all over the States, arranged among yourselves?—A. Yes; I believe that is right.

Q. (By Mr. RATCHFORD.) Are the miners more ready to strike than other tradesmen, or less? What has been your experience in that regard?—A. I can speak more practically from a miner's standpoint. I have not been familiar with, neither have I been a member of, any other trade organization than the miners, but according to what I read and what I have seen I think the miners are very slow in striking, and they do not strike unless they have a sufficient cause.

Q. What accounts for the large number of strikes, local or otherwise, in the trade? Is it because of some peculiar condition as compared with others?—A. I would judge that peculiar conditions have something to do with it, such as I have enumerated here.

Q. Is it your observation that a general scale of prices, for instance, covering an entire State or a number of States, is more or less difficult to make than such a scale would be in the iron industry, for instance, or the glass industry, or any of the textile industries?—A. I think the miners would have more difficulty in making a scale for a State. I can not speak for the glass workers or the iron workers particularly. I would not care to do it. But in a State where there are so many different veins of coal and so many different systems of working it would be quite difficult to form a scale that would be uniform throughout that State for the miners. But I am free to say that during the past few years this is being done with a great deal of satisfaction both to the operators and the miners.

Q. Have you anything to say as to the boycott or blacklist?—A. The boycott and the blacklist are twins, I think. The boycott is used sometimes by the employees, while the blacklist is used by the employers.

Q. Does your organization sometimes use the boycott?—A. We have tried it once, to my knowledge.

Q. Have you any knowledge of any employer who is using the blacklist?—A. I would have to be positive about that. I remember one time I had to leave a place because of certain action I had taken. I could not get work. I had to go to another county, and I suppose that testimony can be secured that such a practice has been in force in different places. It is a very bad system.

Q. (By Mr. FARQUHAR.) Does your organization discountenance the boycott?—A. Yes; generally, it is against it.

Q. (By Mr. RATCHFORD.) Sympathetic strikes?—A. A sympathetic strike is sometimes necessary. It may seem strange, but it is sometimes necessary. For instance, supposing the miners of one State are contesting for a certain wage, and the employers of those miners go to the operators of another State and make a contract with them to fill the trade, in such a way as to give them certain parts of the profits. We realize, as a craft, that the miners of one State could strike, in this age at least, with the facilities of transportation, for a long time, provided the miners of another State may work. If the price of any one State is reduced by a strike and the miners are forced to go to work for less wages, it is only a question of time until the other men in the other States will have to accept the same conditions; hence sometimes we have sympathetic strikes.

Q. Has that been the experience of your trade, that a reduction in a portion of any one field competing with other fields brings about a reduction in the whole competitive district?—A. Yes, that has been the case. I remember one instance: In 1896 a company in the Pittsburgh district—western Pennsylvania—for some reason or other was working below the prices paid in the same district by other operators. Consequently, in order to have trade, the operators of the other mines cut their men down to the same price as the other operator had. That went on until the miners of the Hocking Valley, their direct competitors, were idle for months and months, for the simple reason that they were taking the trade from them; and the officers of the organization were obliged to go down into the Hocking Valley in Ohio and persuade those men and try to reason with them on the advisability of accepting a reduction in order to get some work. In order to get something to do to keep their families they were obliged to accept 16 cents a ton less, simply because these other people were taking the trade away. That was a fact in Ohio in 1896.

Q. How about the people in the Pittsburgh district you speak of?—A. They had to accept the conditions paid by the other man. Started in one place and went right along the line.

Q. That lower price was accepted voluntarily in order to meet the peculiar competitive conditions?—A. Yes.

Q. What have you to say in regard to importation of new or foreign labor under contract?—A. Well, we have not quite so much of that to contend with now as formerly. It used to be, years ago, that agents would go to Europe and bring over men to take the places of the men here, under contract; but during the last few years we are relieved somewhat of that. I do not know, but it seems to me that the class of labor that was brought in years ago has not been entirely satisfactory to the operators or the men who brought them here. I generally find, in my travels and in my experience, that the people who are brought in in that way are generally the most difficult to handle when they start to strike. When they get it in their heads that there is something wrong, you can hardly persuade them to anything, and they not only strike, but destroy property, and in a general way break the laws. Of course, the organization is opposed to any such importation of labor whatever, under contract.

Q. The questions of conciliation, mediation, and arbitration—compulsory arbitration or otherwise—what have you to say as to those?—A. The organization

expresses itself, and prescribes that the method of adjusting grievances is by conciliation and arbitration, and, as a last resort, strikes. But conciliation first; do everything in our power to prevent a strike and settle matters; and if agreeable to both parties we arbitrate, and the only weapon after that is the strike.

Q. Is your organization in favor of compulsory arbitration?—A. I do not think that has been brought up in our conventions. I do not think the miners of the country have acted on that question. I do not think we are opposed to compulsory arbitration under certain conditions. The conditions would be, for instance, when a strike of the miners would tie up through business. I think, under such circumstances, compulsory arbitration should be used. In the States where they have State boards of arbitration it has been very satisfactory, and they have been the means of adjusting many grievances. Of course, there are some who believe that compulsory arbitration would make the workers abide by the decision whether they liked it or not, and they would have no means of ridding themselves of it in the courts; their means would not afford it.

Q. (By Representative GARDNER.) Would not that be true?—A. Yes; that would be true; I have not yet seen a case decided by an impartial arbitrator but what public opinion has invariably been strong enough to make the parties abide by the decision.

Q. (By Mr. RATCHFORD.) The form of arbitration usually provided for in your trade is mutually provided for by the disputing parties?—A. Yes.

Q. (By Mr. FARQUHAR.) Can you settle your trouble between your employers and yourselves a good deal easier with the employers than you could with State boards of arbitration?—A. Yes; the miners have had very little occasion to call State boards; sometimes they have, but very, very seldom.

Q. (By Mr. RATCHFORD.) What have you to say in reference to injunctions in strikes?—A. I have often thought that the injunction, as used at the present time by employers of labor, and exercised as it is, under the plea of restraint of trade, is in reality but a part of the machinery to compel acquiescence with the wish of the employers, by depriving men of their liberties. The injunction has been used very frequently during our labor troubles. I do not think an injunction should be issued by any court, presuming that a man is going to do so and so; I believe every man who violates the law should be punished. I do not see why men, because they walk along a certain road, or because they are seen talking to their neighbor, should be enjoined from doing so.

Q. (By Mr. C. J. HARRIS.) Would you do away with it altogether as a legal remedy in every class of cases?—A. It is used generally against the workers.

Q. Does it not prevent violence and bloodshed at times, when things get into shape that nothing else will fill the bill?—A. It may prevent it in time, and, on the other hand, it may curtail a great deal of individual liberty, too.

Q. (By Mr. RATCHFORD.) With reference to the injunction, have you known of any cases where it prevented bloodshed?—A. No; I do not.

Q. Have you known of any cases where it has cost individuals or organizations money to defend themselves or their members in court?—A. Yes.

Q. Do you believe the law which necessitated the expenditure of that money was just to the men who were obliged to pay it?—A. No.

Q. Do you believe that the men who were enjoined intended to commit crime?—A. No; I had no reason to believe they had any intentions of that kind.

Q. Do you believe that the injunction as a legal measure should be used where there is just need for it, or not?—A. Where there is just need for it, yes.

Q. Then it is not the use of the injunction that your organization complains of; it is rather the abuse of it?—A. The abuse of it; going to extremes.

Q. What method of payment is most desirable to the mine workers represented by you?—A. The weekly pay day is the method that the miners would like to see practiced everywhere.

Q. What advantages or disadvantages are there in the weekly pay?—A. As a general rule the advantage would be that the miners would have more ready money to make their purchases. Sometimes opportunities come across our paths which, if we have a dollar in our pockets, enable us to spend it to greater advantage than we could if we did not have it; and we think this way, that the credit system would be, to a greater extent, abolished. The bimonthly pay made a great improvement from the old way of monthly pay. We saw an advantage in that, and we think if a bimonthly pay was an advantage to our people—to have our money twice a month instead of by the month—that certainly a weekly pay would be a greater advantage. Ready money counts with the working people the same as it does with the money power, and for that reason we favor a weekly pay.

Q. Have you any sliding scale?—A. No.

Q. What are the objections to the formation of a sliding scale, if any; and why should such a scale not be agreeable to both parties?—A. A sliding scale would be all right provided there was a minimum below which the price should not go; and that the minimum should be, in my judgment, sufficient to enable a miner to keep himself and wife and family in respectability.

Q. (By Mr. FARQUHAR.) Has your organization ever tried the sliding scale?—A. No.

Q. Are you aware that the sliding scale is one of the best features of the English mining industry?—A. Yes; I am aware of that.

Q. (By Mr. RATCHFORD.) Store orders and payment in kind; is this system of payment practically general in the mining regions?—A. It is not general, but a great many places do practice that kind of payment.

Q. Is that satisfactory to the members of your organization?—A. It is not at all satisfactory, and time and time again they have resolved in their meetings to have it abolished.

Q. Why is it not satisfactory?—A. The store order should be abolished because it is not the equivalent of cash. Store orders are only good for that certain store. You must pay whatever prices they ask; can not go any place else. Other stores will not take the orders. In some places where they do make a little trade in one commodity or another there is generally about 20 per cent discount. Store orders, in my judgment, and payment in kind, ought to be abolished if there could be some way of doing it.

Q. Any other objections to it?—A. Probably a great many objections, but I think that is the principal one; that it is only good for a certain store, and that it is not cash. You can not go any place else with it.

Q. How are the prices in these company stores as compared with prices in other stores?—A. Generally the prices in the company stores are very high, anywhere from 20, 25, and 30 per cent. It depends a great deal upon where the store is located. If a mine is located 3 or 4 miles from a town—generally the miners live around the mine—there is only that one store there. It has no competition with the outside world, and the miners must generally give them their price, no matter what it is. Where a company store is located in a town with other stores, where they have opposition next door, etc., there is not so much difference; but where they are isolated and where the company owns the land and no other store can be allowed, then the prices are very high and are very exorbitant, indeed.

Q. (By Representative GARDNER.) In such cases is the high price due to the money-order system or the isolation of the store—the lack of competition?—A. If they had cash they could probably go a mile or two; they would be more likely to.

Q. At any rate they would feel that they could?—A. Yes.

Q. (By Mr. RATCHFORD.) When this lack of competition exists what is it due to; natural causes?—A. Unnatural causes, I think. There are some cases where the operators own the land for probably a mile or two, sometimes more, sometimes less, and especially is this true in West Virginia. There is not a schoolhouse, barber shop, or meat shop, or anything of the kind that is not almost directly under the supervision of the coal companies, and of course a grocery store or dry goods store or something of that kind. If the operators had that general store, and they deal in this merchandise, there is no other piece of ground sold or house rented in which another man could go in and have a store. They are obliged to go there and deal. Of course, if they had money they might go to cities near about. All they can do is to deal in that store, and they are charged very high prices for the goods.

Q. (By Mr. FARQUHAR.) Have they tried to abolish these stores by law in the different States?—A. I do not know about that; I think they have. I sometimes think they will only be abolished by the trade unions themselves.

Q. Would not a law in the State of Ohio that all wages of employees shall be paid in money, weekly or bimonthly in cash, be a great help?—A. Yes.

Q. Would it not obviate the usual reasons given against laws of that kind, that you can not pass a law against mining corporations that does not apply to the corporations all over the State?—A. Yes.

Q. (By Mr. RATCHFORD.) Are you aware of any influence, direct or indirect, brought to bear on these miners to deal in the company stores?—A. Yes; I know a case directly, and many cases indirectly. I want to be positive of my ground. I worked one time for a man named Robbins on the Baltimore and Ohio track 2 miles east of Cambridge, Ohio, mining coal. My family did not care to deal out of the store. We lived 2 miles from Cambridge. My wife could do better in town, and, like all other good housewives, of course she wanted to make the money go as far as possible. I was there 9 months. I never got my money on

pay day that they did not ask me why I did not deal out of the store, and finally I was cornered out; I was not discharged. What I mean by saying discharged is that I was not told, if you do not deal out of my store you can not stay here. But I was placed so that I could not work.

Q. Do you believe you were discriminated against?—A. Yes; because I took all my money, outside of the powder and oil, in cash.

Q. What was the name of that company?—A. Robbins Coal Company, at that time.

Q. Fines and penalties—have you anything to say on that?—A. The miners have no fines or penalties, only in the way of docking, or something of that sort, that I spoke of this morning.

Q. What have you to say with reference to mine tenements?—A. There could be a great deal said in this particular. The houses built by the companies for the miners are very poor, to say the least. They are generally very small. The location is anything but desirable. They have no sanitary regulations whatever in a majority of cases, and I think there could be a great improvement made in the way of building those houses and having them properly looked after. They are practically the same in every State. In Ohio I believe they have as good houses as anywhere, but they are built principally with straight boards. They go into the timber land with their sawmill and cut the trees down and saw up the logs, and the houses are nearly all built with straight up and down boards, with a slat put over the board. Many of them are not plastered at all; some of them are.

Q. (By Mr. PHILLIPS.) Are they all papered?—A. The company furnishes the paper in some cases; in some cases it does not. As a rule, they paper them.

Q. (By Mr. RATCHFORD.) Is the class of houses built in more recent years improving over the class built formerly?—A. No; not to my knowledge. They are put up very cheap. I know of one case where there were five company houses put up at a contract price of \$95 for each house. These houses were built in 1882, and there are people living in them and paying \$5 or \$6 a month for them. I do not think there is much improvement in that line.

Q. (By Mr. C. J. HARRIS.) Are mining tenements sometimes temporary on account of the mine not being a permanent thing, or are your coal mines permanent—that is, run for a good many years?—A. Yes; this mine I speak of now has been running probably 21 or 22 years.

Q. If they were being used for only 2 or 3 years, they could only afford a cheap house?—A. Most of the mines last anywhere from 15 to 25 years, and some longer than that.

Q. When they are through with the mine the houses are really of no value?—A. That is right; there is nothing there but the mines. Of course, nobody wants to live in them then.

Q. (By Mr. RATCHFORD.) I say, what influence has the tenement house and the company store, either or both of them, in suppressing strikes or giving rise to strikes?—A. Well, the influence, in my judgment, would be more to prevent strikes than anything else. The people who work and deal in the company store so very seldom get anything laid by that they are depending upon their work and consequently upon the store; and then they know if they strike and refuse to work that the company would want them to move out of its houses, and consequently they will be both out of work and out of a home.

Q. Have you any cases in mind in which methods of this kind were adopted?—A. No; nothing more than in a general way. I do not think that I can state any particular case.

Q. Have you any recollection as to any case in which a strike resulted in the eviction of miners living in company houses in any of the States? I mean by eviction the wholesale vacation of the houses.—A. Yes; they did that in 1897 at one or two mines down in West Virginia. When the miners refused to work there the sheriffs and deputy sheriffs went and put their furniture on the wayside.

Q. (By Mr. PHILLIPS.) Can you name the mines or the companies?—A. No.

Q. (By Mr. RATCHFORD.) Have you any recollection of that occurring in any of the other States—in Pennsylvania?—A. Yes; it has occurred in Pennsylvania. I can not remember the names of the companies. It has occurred in Pennsylvania and Ohio and Illinois, to my knowledge.

Q. (By Mr. FARQUHAR.) Did it occur in the Connellsville coke region and among the Scott mines in Pennsylvania?—A. Yes. That was before my official time, I suppose. I read of it and heard about it. I understand they did it there by wholesale.

Q. (By Mr. PHILLIPS.) Have you ever been in the mining camps or at the mines where there have been general evictions?—A. Not at the time.

Q. Or immediately after?—A. No.

Q. (By Mr. RATCHFORD.) As to the difference of wage schedules—different States and sections—have you anything to say on that?—A. Not particularly. Of course, they vary as to prices.

Q. What can you say of the influence of organized labor on wages?—A. I would say that, to my knowledge of 15 or 20 years, the tendency of wages has been downward, and this downward tendency is only checked at certain times by the strength of the miners through their organization. We have gained, as I said this morning, about 20 per cent in the last 2 years. That has checked a little the last 2 years, but the tendency of wages has been downward for years, and the organization, in my judgment, is the only thing that checks the downward tendency.

Q. (By Mr. C. J. HARRIS.) How long did you say you had been in this business?—A. Well, officially, 10 years. I have been in the business 25 years, or all my life.

Q. How far could you go back in business?—A. Well, 25 years.

Q. (By Mr. RATCHFORD.) In this country?—A. No; I can not go back that far. I can go back 20 years in this country.

Q. What have you to say as to the social condition of labor during that time?—A. I think the social condition has improved somewhat.

Q. Have the wages improved?—A. No; not particularly; but the social features of it have. There seems to be a better understanding between the workers than there used to be—more intelligence, which signifies a lot in bringing about a better social condition.

Q. Are the social wants better supplied now than they were formerly?—A. No; I do not know that these people want more than they did formerly.

Q. Their wants are increasing?—A. Their wants are increasing.

Q. (By Mr. C. J. HARRIS.) Is there not a cheapening of articles? Are not sewing machines and other like things far more prevalent now than they were?—A. Yes; but I think, according to my knowledge of things, that it is as difficult now to get a sewing machine as it ever was. While they may be cheap, money is scarce, among the miners especially, and no matter how cheap an article is, if you have not the money you can not buy it.

Q. Do your people have accounts in the savings banks to any great extent?—A. No; I think it takes all that they make to keep them even the way they live, and in many cases I do not think that a dollar or a dollar and five cents or ten cents a day is sufficient to give them much chance to put anything away in a savings bank.

Q. (By Mr. RATCHFORD.) The increase or decrease of the number of employees—excess of employees—have you anything to say on that?—A. No.

Q. Have you anything to say of the effect of the employment of children on themselves and on adult labor?—A. Yes. I think that when a boy or girl goes to work too early it has a tendency to make them physically as well as mentally weak. Especially in the mines, when a boy is in his tender years, the atmosphere is not what a boy of that age ought to breathe, and it stunts him to a great extent, and then when he gets into a mine, starts in there, he generally has to stay there. Finally, of course, his schooling is cut off; he has no chances of educating himself, no opportunities to become intelligent in any way, and this prevents him from developing in almost every faculty he has. If a law could be passed that would even prevent children from going into mines or workshops or factories, mines particularly, under a certain age, I think it would be a good thing.

Q. What age would you propose?—A. I do not think a boy should go into the mines less than 14 years, no matter under what circumstances. I think 14 ought to be the very least a boy should go into the mines.

Q. What causes do you assign for irregularity of employment, mainly?—A. Some call it overproduction, some call it underconsumption, and some ascribe it to strikes and lockouts, market and economic conditions. There are different causes why the work is so poor. I judge, from the miners' standpoint, that we have almost a third more miners than are necessary to mine the coal that is required for consumption.

Q. (By Mr. FARQUHAR.) Do you mean union or nonunion?—A. I mean the miners of the country.

Q. (By Mr. RATCHFORD.) In your trade the season has something to do with irregularity of employment, has it not?—A. Yes; in different localities. There are some localities where the trade is best in the winter for the miners; in others it is best in the summer. It regulates itself in this way: Where coal is shipped by water, on the lakes, the summer is the best time, when it goes to the West and Northwest. Where the market is inland, or where they do not have to go on the

water, generally the winter time has the best trade. The big Hocking Valley in Ohio does most of its work in the summer months, while the operators of Indiana and Illinois do their work in the winter months.

Q. Any other causes of a general nature?—A. No; I do not know. There might be a great many causes assigned for that, but where there is a market there will be coal produced, and where there is no market there will not be any.

Q. Has the introduction of machinery anything to do with it, and electricity and gas, which are used as substitutes for coal sometimes?—A. Sometimes. The gas in the Pittsburg district there interfered with the mining considerably, and of course the more gas there is burned the less coal there will be burned, which will be less work for the miner. Machinery has also something to do with it. They produce a great deal more coal in a day or a week now than formerly.

Q. (By Mr. C. J. HARRIS.) Has there been a large increase in the consumption of nut coal?—A. Yes.

Q. (By Mr. RATCHFORD.) The number of days employed, hours of labor in the several States, Sunday labor—anything to say on those subjects?—A. No. I suppose the statistics will show that for the last 5 or 6 years the working days of the year have varied a very little. I think it is about one hundred and eighty-five or seven—along in there somewhere.

Q. What have you to say in regard to the shorter workday and its effects where adopted?—A. The effects of the shorter workday have not been, to my knowledge, any hardship whatever on our employers. On the other hand, it has given men the opportunity to be with their families a little more; it has given them an opportunity to read, to think, and to study problems that they ought to be familiar with, and in the four States, Illinois, Ohio, Indiana, and western Pennsylvania, where the 8-hour shorter workday has been in force for a year, neither the operators nor the miners wish to go back to the old way, and all seem to be satisfied with it. A man with a family is more at home; socially he is happier; his system is kept up better, and, take it all in all, it seems to me that the effect of the shorter workday has been very beneficial to the workers.

Q. You say that the operators do not want to go back to the longer workday?—A. They did not make any opposition to it in the last general meeting we had.

Q. Was that shorter workday movement readopted at your last meeting?—A. It was readopted at our last meeting; and we will continue to work 8 hours during this year, by joint agreement.

Q. The operation of existing laws as to screens, company stores, etc., cooperation, premium payments, profit sharing, industrial copartnership; anything to say on that?—A. No.

Q. We will go to the question of immigration and education. What have you to say on them?—A. The general effect of immigration from the British Isles, France, and Germany may be other than the overcrowding of the labor market. The people of the above countries demand good wages, comfortable conditions of employment, and readily adopt the highest American standard of living and morals. Slavs, Poles, Hungarians, and Italians are not so desirable, their standard of living being lower. They are a longer time assimilating American ideas. They are the principal menace to our wages and morals in this country. I have come to this conclusion because of my personal knowledge of the people that have been imported here. The standard of living, to a very great extent, is brought about by the people themselves, and you will find that the English-speaking people desire a higher standard of living; they desire to live in more respectability, more comfort, and all that sort of thing than these non-English-speaking people do. I sometimes favor that legislation, if it could be enacted, preventing the employment of any in the mines but those who would stand an examination demonstrating their knowledge of mines and mining; and, providing, that unless they can show conclusively that they have sufficient knowledge to take the prescribed examination, they should be excluded from the mines unless they serve as apprentices to experienced miners for at least a couple of years. There are a great many of these men in the mines that do not understand much about mining; and I believe that it is the inexperienced miners that make all the trouble. They go into the markets with the dirty coal. If they had good miners—practical men in the mines—there would be very little trouble in marketing all the coal; and I think it stands to the interest of the operators and employers, as well as the employees, to see that some kind of a test, some practical knowledge should be required of the man that enters the mines.

Q. (By Mr. PHILLIPS.) What is your native country?—A. England.

Q. When did you come to this country?—A. 1880.

Q. How old were you when you came?—A. I was 21.

Q. (By Mr. CONGER.) You are a citizen of this country now?—A. Oh, yes.

Q. You would be in favor of prohibiting the immigration of all non-English-speaking people?—A. I would be in favor of preventing them from coming, as far as the law goes, under contract. When a man wishes to come to this country, pay his own way, and has sufficient to start him in life—help him, I mean, until he gets employment—I think there should be no objection to persons of this kind.

Q. Do you think the present immigration laws are adequate and satisfactory, or would you change them?—A. They are a great improvement; they have done a great deal for us, as miners, we think. We believe they have prevented a great many people from coming and taking our places. There might be some way of making an improvement, of course, but we can only find that out by experience. I believe the present law has done a great deal for the miners in the way of keeping this class of people out.

Q. You think they are quite sufficient and you do not advocate any changes?—A. I think that if we had the laws now in force for a time, at least, they would be perfectly satisfactory.

Q. (By Mr. RATCHFORD.) Have you reason to think or believe that those laws are not operative?—A. No; I have no reason to think that. I believe that wherever the department of immigration has the least idea that the immigrants are coming here under contract, they are doing all in their power to enforce the law and prevent it.

Q. Do you know of any cases in your district where laborers have come in under contract?—A. I would not be certain about it, but it was reported that there were people in New York who had arrangements made with some people in European countries to bring over some people for the Pana strike up here in Illinois, among the miners. That was only reported, and I know for a fact that the department of immigration had their agents in Pana watching for them, and they also had them watching here at Ellis Island, expecting that if they should happen to slip in or slip through, they would find them at the other end.

Q. (By Mr. FARQUHAR.) Have you any facts to present, or general information of your organization on educational tests of immigrants as a restrictive measure?—A. No.

Q. (By Mr. RATCHFORD.) Have you anything to say on the question of colored labor?—A. As far as we are concerned as miners, the colored men are with us in the mines. They work side by side with us. They are members of our organization; can receive as much consideration from the officials of the organization as any other members, no matter what color. We treat them that way. They are in the mines, many of them good men. There is only one particular objection, and that is they are used to a great extent in being taken from one place to another to break a strike, as we call it, in such cases as we have here now at Pana, where this trouble is going on, and that trouble they had at Virden, Ill. I sometimes think that they are not taken to those places because they want to go. I sometimes think it is their ignorance of the matter. I would rather put it that way. I think it is because of their ignorance of the labor movement and the labor world that they are deceived by those who engage them, and that there are beautiful pictures drawn for them. When they get to a certain place, why they are there, and some of them, I know, many times are sorry for it. But still they are used for that purpose, and I would rather attribute their use to break strikes to their ignorance than anything else.

Q. (By Mr. PHILLIPS.) What per cent of colored laborers are employed in the mines throughout the country; have you any facts or figures?—A. I could not give the facts or figures; I have nothing positive.

Q. Will you give your estimate?—A. I think probably 10 or 15 per cent.

Q. Of all the miners in the United States, embracing both the anthracite and soft coal?—A. Yes; I think that is probably fair from what I have seen of it.

Q. (By Mr. RATCHFORD.) The public-school facilities and their adaptability to the needs of the working people—what have you to say as to that?—A. I think that the rising generation, with the privileges of education they have, will be much better men and women than we are, as laboring people. I think that education will bring about for the workers of this country as much, if not more, in the future as the trade unions will do. The better educated a boy and a girl, a man or a woman is, the less servile they will be, and when they come to find out that there is something to live for, in my judgment they will not work for a wage which will only merely keep them in existence, but they will demand, because of their knowledge of things, a better price and receive better wages than we have. The schools in the principal mining districts are very efficient, but I think that in some cases if there could be some provision made for night schools where the young men could have opportunities to go to school it would be a great thing for them. I know there are many young men who have been deprived

of schooling when young; and, working in the mines in the daytime, they have no opportunities to go to school, and many of them think they are too big to go to schools with little boys and girls. If there were night schools, I think it would be a great help. As to the efficiency of the schools, in my judgment at least, I have no complaint whatever against them.

Q. Have you anything to say as to discrimination in freights, concentrations, and consolidations?—A. The freight rates and that sort of thing—it is a hard matter for a labor organization to get at those things. We are told by our employers sometimes in making our contracts that there is discrimination, and that a certain company or a certain operator, through some influence or other, has an advantage of them in the markets by reason of freight rates. We have no positive knowledge of that. We can hear all these things, but that does not give us the positive knowledge, because the man who has an advantage of this kind keeps it to himself; he tries to, at least. And they do not give us these figures, but it is their business sometimes, although it has never been proved scarcely, for the want of books, etc. There is evidence, however, that there are operators who have an advantage of others, either by being connected in some way with the railroads, or something else. Some of the coal companies in the big coal fields also control the railroads, or have an interest in the railroads, at least something of that kind, which probably is of advantage in freight rates. I do not know how we can get at that positively, I am sure; but that is the understanding and that is the suspicion.

Q. Take up the subject of the present mining machinery and its effect on the prices and profits of labor.—A. There is no doubt but that the present machinery is cutting quite a figure in regard to prices and profits, and it has also quite an effect on labor. I think, however, that the commission could best get authentic figures by consulting Parker's Geological Survey. The machinery has to a great extent displaced labor in our coal mines, and it is here to stay. You can not possibly object to machinery. The improvements will come on, and we welcome them, but we as workers simply want, if we can, to have a share in the benefit of that machine. The machine-mined coal meets in the market with pick-mined coal, and the operators, of course, are taking advantage of these things; and where they used to compete with pick-mined coal, they have now their machines, and they compete, of course, with machine-mined coal. I do not know that the price cuts much figure. I do not know whether the operators are getting much more profits by machine-mined coal than they used to when all the coal was mined by pick, because they are competing with pick coal mined by their neighbors right along.

Q. (By Mr. FARQUHAR.) Is there any displacement by these machines of the numbers of working miners?—A. No; there are more miners. I think there have been more the last few years than there were. The miners of the country are increasing. I would think that this is caused by the new developments in the West and Northwest. We have coal now in a great many of the States where we did not have it formerly. We have in West Virginia now nearly 20,000 miners where we used to have only 6,000 or 7,000. As the States develop, of course men flock to the mines, from one State to another. The increase is slow, but there are a little more in the mines than there used to be.

Q. In mines where these machines are used are there less miners employed now than there were before these machines were put in, for the same tonnage?—A. Oh, yes; less men and more tonnage.

Q. Will you give us just about how much of a displacement of labor it is?—A. No; I can not give the exact figures in that respect; but where they put in machines they generally open out their mines, and where it took two men to work one place one man will be in a place, and that would make more room for the other men, and hence the production is much greater according to the number of men.

Q. (By Mr. RATCHFORD.) If the production of a mine can be increased by the use of machinery and with a less number of workmen in one mine, is not that also true of one State and of the entire country?—A. Yes; it will be the same thing in the State as it is locally.

Q. Would the number of miners employed to-day in the United States produce their present tonnage in mining with the old methods, working the same hours and the same days?—A. No; they could not do it.

Q. (By Mr. PHILLIPS.) If any given mine that works a hundred men by pick were worked by machinery, how many men would be saved out of a hundred?—A. About forty—almost that many.

Q. (By Mr. RATCHFORD.) Does not the relative price of pick-mined coal, as compared with the price for machine-mined coal, indicate plainly the amount of labor displaced by machinery?—A. Yes; that is, nearly one-half, as forty is to a hundred; just about that.

Q. What can you tell us as to industrial or remedial legislation?—A. Most of the mining States have laws dealing with the subject of employers' liability. I think that they are properly looked after; are carried out in their true meaning. I do not know that I could say much on that. I think probably that an employers' liability law could be brought about in a national way.

Q. What have you to say as to sanitary laws, mining-inspection laws, etc.?—A. Where there is mining to any great extent the State has laws governing it, and some of them are about as well drafted for the present as I think they could be. The inspection is done, to my personal knowledge, in a very systematic way, especially in Illinois, Indiana, Ohio, and western Pennsylvania. The mine inspectors have certain duties to perform, and they do them regularly, and the safety of the miners under the mining laws is much better than it was years ago under the old system.

Q. Have you anything to say as to uniformity of mining legislation in the several States?—A. I think the only way that uniform legislation for the several States and Territories could be arrived at would be by national law. The State laws they have now differ a little in the different States, but not much. Their principle is the same and the intention is the same, for the safety of the men and all that sort of thing. But for a uniformity of mining legislation it would have to be done, of course, by the National Government.

Q. (By Mr. PHILLIPS.) In your judgment, which State has the best mining laws?—A. Ohio has been in the lead, in my judgment.

Q. If the laws of Ohio were adopted in the other mining States it would make a uniformity?—A. Yes, of course. I would want the Government to take the best laws if they made a national law. Ohio was one of the first States to have any laws in reference to mining inspection, and other States of course have fallen in line, and it has improved year after year, as they have seen some little changes that were necessary by experience. The last legislature, which has just adjourned, in Springfield, Ill., I understand, has made some very great improvements in the law of Illinois. I have not seen them yet, but I understand they have made some changes, and they may get up with Ohio before they get through with them.

Q. (By Mr. FARQUHAR.) Does your national organization in its annual meetings take up the laws of the various States and discuss them?—A. No.

Q. Are there any formal representations made to your organization of the failure of remedial laws in any of the States?—A. No; they are reported to the State authorities.

Q. Have you legislative committees at the State capitals?—A. No.

Q. Have you any legislative committee at all in your organization?—A. Not a standing legislative committee. In case of a bill like we have now before the Ohio legislature, at least the one that was passed there last winter, it is generally customary, when we have a bill like that, to send one or two men up to try to get it passed—talk to the representatives; but we have no standing committee.

Q. Have you an emergency committee?—A. No; nothing more than our executive board is considered an emergency committee. They look after the organization in detail, but we have no particular committee.

Q. Your organization, in its national or State capacity, does not take up these questions of legislation?—A. Before the legislatures of the several States—no.

Q. How is the legislation secured?—A. Sometimes a miner will be elected to the legislature. He has experience and generally introduces the thing first, and then of course he calls upon the members of his district to help him out, and in that way it is principally brought about. I think the first laws we ever had in Ohio were brought about by one of our officials, a miner, being elected to the legislature, and, seeing the need of these things, he introduced them into the House.

Q. So that the remedies for the evils in the mining trade, as far as the miners are concerned, are brought about more through the organization in conference with the employers than by going to the legislature for legislation?—A. No; I do not think that the employers have done very much.

Q. Have you, in conference with your employers, taken up this matter of wages and sanitary matters?—A. Oh, yes; we do that.

Q. (By Mr. RATCHFORD.) Is it a fact that by your mutual agreement with the operators you have wiped out more screens than by all the laws that were ever enacted?—A. Yes.

Q. Is it a fact that by mutual agreement with your employers you have shortened the hours of labor more than all the laws that were ever enacted?—A. Yes.

Q. You are relying principally upon your organization and upon the joint relationship of both the miners' organizations and the operators' associations—mutual relations—to bring about these improved conditions you want?—A. Most decidedly.

Q. (By Mr. FARQUHAR.) Do you find that it is nearly always a failure for your organization to get remedial legislation?—A. Almost a failure.

Q. That it is declared unconstitutional if you do get it?—A. Yes.

Q. And that in the long run you more generally get these reforms by mutual agreement than in any other way?—A. By meeting together and discussing the matter.

Q. (By Mr. PHILLIPS.) Did you not state that the mining-inspection laws were perfect, or about so, and that you had no reason to complain?—A. I said that, yes; in many of the States.

Q. The point is this: That legislation has been of considerable benefit to the miners?—A. In the way of legislation for air, the general condition of the miner in the mines, and safety.

Q. Could those safety arrangements have been brought about without the legislation you speak of?—A. I do not doubt but what it would have come, but it can be done with legislation better.

Q. Would the present sanitary and safety conditions of the mine have been the same had it not been for legislation, or nearly so?—A. No; I do not know that they would. I think the law helps us a good deal in making these improvements.

Q. (By Mr. RATCHFORD.) Is it true that without such legislation it would be an impossibility to have the ventilation and safety appliances necessary for the protection of life and limb and inspection?—A. I think that if we did not have the laws we could not possibly. I think that the laws help us a great deal. In fact, we could not have the safety of the miners, only by legislation.

Q. To the laws, then, of the States that much credit is due?—A. That much credit is due.

STATE OF INDIANA, *County of Marion*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

W. C. PEARCE,
Secretary and Treasurer, United Mine Workers of America.

Sworn and subscribed before me this 11th day of July, 1899.

JAMES STEVENSON,
Notary Public.

My commission expires August 4, 1901.

WASHINGTON, D. C., *April 14, 1899.*

TESTIMONY OF MR. S. M. DALZELL,

President Illinois Coal Operators' Association.

The commission met at 10.30 a. m. Vice-Chairman Phillips presided, and introduced as a witness Mr. S. M. Dalzell, president Illinois Coal Operators' Association. The topical plan of inquiry on mining was followed.

Q. (By Mr. RATCHFORD.) What is your business?—A. General manager of the Spring Valley Coal Company at Spring Valley, Illinois. It is in the northern part of the State, about 104 miles southwest of Chicago, between Chicago and Rock Island, and 5 miles from La Salle.

Q. How long have you served in the capacity of president of the operators' association?—A. Since its formation; I think it was in November or December, 1897.

Q. Does the association cover the entire State of Illinois?—A. Yes; although there are a number of operators in the State who are not members; but a large majority of them are.

Q. Have you any connection or relation with the operators' associations of adjoining States or competing States?—A. None, except as we have met in interstate conventions.

Q. Please explain the purposes of your association and your meeting in interstate conventions.—A. The Illinois Coal Operators' Association was formed with the purpose of going into the interstate convention of January, 1898. Connection with the association is voluntary, and every one has a right to withdraw on notice.

Q. State to the commission anything you may desire in connection with the comparative earnings of capital invested in mining during the past 50 years.—A. I am unable to go back 50 years. My first connection with mining was in a small way in 1872, and only for a comparatively short time. The earnings of capital in the coal industry at that time were large. I was speaking to Mr. Joseph Forker, an old friend. We were talking about coal mining in the early days when he was mining coal in the Shenango Valley district of Pennsylvania. It was Mr. Joseph Forker. I said, "Mr. Forker, what did it cost you to mine block coal?" He said, "We never knew. We mined 50,000 or 60,000 tons of coal per year, and we divided \$50,000 or \$60,000 per year." The earnings of capital invested in coal, perhaps within the last 10 years particularly, have been, so far as my experience goes, small. I am speaking particularly of the northern part of Illinois, now. I think the same amount of capital invested in any reasonable security would have paid a better interest on the investment than it has paid during the last 9 years; very much better.

Q. (By Mr. PHILLIPS.) Is that also true of other parts of your State and other States?—A. In a general way, it is. There may be special cases where the earnings have been large because of peculiar conditions. I think that has been true of the coal business, as a whole, for the last 8 or 9 years; that is, in the competitive fields. I do not know what it is outside.

Q. What is the percentage of failures in the coal business?—A. I could not say.

Q. (By Representative GARDNER.) Is the period of 8 or 9 years mentioned in a general way, or because of some special conditions which have arisen in that period?—A. It is true that during that time we have been subject to a number of strikes, which have not only stopped the earning power of the money invested in the properties, but have allowed the mines to deteriorate, and it has cost money to put them in order. It is not true so far as bad debts are concerned. I do not know what it is in the East, but in northern Illinois we make comparatively very few bad debts; not usually in large amounts.

Q. Suppose the period were stated at 5 years?—A. It would not improve it.

Q. Would it lessen it?—A. I think it is about the same.

Q. You think it is standing at about a level now?—A. Yes, and has been for about 9 years.

Q. What if you made the period 15 years?—A. During the time previous to 9 or 10 years ago I was not for a number of years connected with the operating and was not in a position to know the earnings of the coal companies, except as I heard men talking, saying whether they were making money or not.

Q. (By Mr. FARQUHAR.) Where do you find markets for northern Illinois coal?—A. Throughout the Northwest. When I speak of northern Illinois it means Braidwood, Streator, Spring Valley, and La Salle districts. A very small percentage of that coal is marketed in Chicago; the balance of it goes to railroads and to manufacturers and retail dealers in the Northwest.

Q. The products of what States come into competition with you in this market?—A. The products of Indiana, Ohio, Pennsylvania, and Iowa, particularly.

Q. Is your transportation nearly all rail?—A. Our transportation is all rail.

Q. Is the quality of your coal equal to the competing coal?—A. It is not equal to the Ohio or Pennsylvania coal.

Q. Does it ordinarily reach as high a price in the market?—A. No; in competition it will not bring anything like the price. The coal of northern Illinois, if it were located in Ohio or Pennsylvania, would not be marketable. We could not mine it at a price which would enable us to sell it in the market if it were mined in the same locality with their coal.

Q. What grade of bituminous coal would you call it?—A. If you take Pittsburg coal as the first grade, Ohio as the second, I think about third or fourth grade.

Q. How far west do you find markets for the Illinois coal?—A. We ship a very little coal into Nebraska and South Dakota. It goes principally into northern Illinois, northern Iowa, southern Wisconsin, and southern Minnesota.

Q. What is its usual consumption—manufacturing or domestic purposes?—A. I can only base my statement upon the output from our own mines. I should think about 65 per cent of it is consumed on railroads and 35 for steam and domestic purposes.

Q. (By Mr. PHILLIPS.) What is the comparative cost of mining coal there and in the Pittsburg and Ohio districts?—A. In our particular field the cost is very much greater. I think the run-of-mine coal, as I remember it now, at Pittsburg is about 40 cents a ton. In northern Illinois, at our property, we pay 63 cents for run-of-mine coal.

Q. What is the cause of the differences?—A. There are two or three causes for

it. The first is that the vein is about 3 feet 8 inches thick. The work is done on what is known as the long-wall system, in which we take out all the coal. In order to haul the coal to the bottom of the shaft we are obliged to take down roof in the entry, and the miner is obliged to handle a certain amount of rock in order to protect his working place or room, and the company is forced to do a very large amount of brushing in the roadways in order to make height that the coal may be hauled to the bottom of the shaft. I presume that we hoist an average of 1 car of rock for every 5 to 7 cars of coal; certainly 1 car of rock for every 5 to 8 cars of coal.

Q. Is that from the roof or floor of the mine?—A. Usually from the roof. We have a great many falls. We are obliged very largely to timber our roadways on account of the soft character of the roof. That adds largely to the expense. We are obliged to sink shafts in our section from 340 to over 500 feet deep and to hoist the coal.

Q. Do you have much water to contend with?—A. At our place we have none at all, except surface water. We do not strike a drop of water in sinking a shaft, except surface water at probably 20 or 25 feet deep in the valley and 50 or 60 feet deep on the prairies. The mines are dry and dusty, and we are obliged to sprinkle the roads to lay the dust.

Q. Do you have gas?—A. We have no gas. There has never been, as far as I am able to learn, a sign of gas in that particular vein of coal. We can work right under the river and not have a bit of water until you strike what is known as salt water, at a depth of 700 feet, and at about 1,300 or 1,400 feet you strike artesian water in the St. Peter sandstone—fine water for drinking. It is very peculiar that we should have no water.

Q. What kind of material do you go through in sinking a shaft?—A. Go through shale, rock, and pass through different seams of coal at various places, in layers, which compels us to timber the shaft from top to bottom.

Q. (By Mr. FARQUHAR.) Is there a State law requiring the timbering of your shafts?—A. Not that I am aware of. We could not operate a mine without it; could not keep the shaft open.

Q. (By Mr. PHILLIPS.) Is your coal comparatively free from sulphur?—A. There is considerable sulphur in Illinois coal—more than we wish there was.

Q. (By Mr. RATCHFORD.) You stated that if the coal mined in your vicinity were mined in Ohio or Pittsburg you could not compete with the coal that is being mined there. Does the advantage of a cheaper freight rate in the northwestern market enable you to compete with these other coals?—A. Yes; our location. It is the location close to the market which enables us to sell coal which otherwise we could not do. To show you how that operates, Pennsylvania and Ohio coal will be taken to the lakes, loaded on vessels, transported to Duluth, hauled to St. Paul by rail, and delivered there at a price, quality considered, with which I can not compete from Spring Valley.

Q. (By Mr. PHILLIPS.) How many acres or square miles of coal lands are there in the State of Illinois?—A. I could not answer that.

Q. Is it opened widely apart in widely different sections of the same vein?—A. The vein that we work is continuous throughout the larger part of northern Illinois, south of Spring Valley and La Salle.

Q. How is Streator located?—A. They have the same vein we have. With one exception they are not working the same vein. Only one mine there, I believe, is open on our vein. The coal is continuous from our neighborhood south almost the entire length of the State. There is a very large coal area in that State. I should think at a rough guess that 65 or 75 per cent of the State is underlaid with workable coal.

Q. (By Mr. RATCHFORD.) How is the price of mining arrived at between yourself and the States named which you are competing with?—A. I do not believe I can go back to the origin of it. When I went into Illinois 9 or 10 years ago, in the northern part of the State we had a mining rate which was, I believe, arrived at in some previous interstate convention. I am so informed. In 1894 we met in interstate convention in Columbus and the mining rate for northern Illinois was compared with the rate in Ohio, Indiana, and Pennsylvania on the basis of screened coal. Since that time the basis in Illinois has been changed from screened to run-of-mine coal. In changing it in northern Illinois, which was at that time the basing point for the State, we deducted just the percentage which had been allowed by custom and which experience had taught us was about the percentage of screening produced in mining coal. I think the reduction was 12½ cents per ton, in the neighborhood of 16 or 17 per cent. I am not sure about the percentage. We have remained on run-of-mine coal since 1897, and at the convention in Chicago in January, 1898, while northern Illinois was not made the basing point, but Danville, in the State convention, the differential for northern

Illinois was continued at the same ratio; and while we did not fix the differential in Pittsburg in January of this year for anything except the Danville district in Illinois, the differential was maintained as it had been.

Q. When you speak of your meeting in Pittsburg and Chicago, to whom do you refer?—A. I refer to operators' and miners' representatives from what is known as the four competing States, namely, Illinois, Indiana, Ohio, and Pennsylvania.

Q. Were those relative prices arrived at through such joint conventions mutually?—A. My understanding is that originally this differential for northern Illinois was arrived at in that way, although it was before my time.

Q. They are maintained in that way at the present time?—A. Yes; that is to say, the basing point in Illinois was made the Danville district in the last two interstate conventions. Previous to that it had named two or three different points in Illinois as basing points, but at the last two it only named one, which was Danville, and in our State convention of miners and operators in Illinois we agreed on different prices, which gave northern Illinois exactly the same relative price that we had in previous years.

Q. Are such prices relatively fair and competitive?—A. I find people who will say that the mining prices in Illinois are relatively higher than they are in the other States. I am not prepared to agree with that proposition. I believe that with the same conditions—they may vary and consequently the prices be out of line in certain sections—as a rule the prices to-day are fairly competitive.

Q. Are they voluntarily agreed to by both parties?—A. Yes, and no. Part of them were voluntarily agreed to, and we were obliged to accept the balance of them.

Q. Is the excessive mining price in your locality, as compared with the price that prevails in Pittsburg, due to a smaller vein, or to differences in your state of mining and trade conditions generally?—A. It is due, I think, wholly to a smaller vein and the more expensive mode of mining. I do not think the trade conditions generally affect it, or the higher freight rates especially.

Q. (By Mr. C. J. HARRIS.) Have you any State laws or anything of that kind that interfere with the coal-mining industry that are oppressive, in your opinion?—A. In Illinois we are trying to have a new general mining law passed. I do not know whether we are going to succeed or not. I am a member of the labor bureau there and, I think, the instigator in drafting the measure in which we are trying to put the laws into shape that will be fair to both capital and labor and protect capital as far as possible, and labor as well; life especially.

Q. (By Mr. RATCHFORD.) Are capital and labor both united on that law?—A. The bureau of labor drafted the proposed law and invited the operators and miners of the State to appear before it and offer their suggestions, the idea being to present to the legislature a bill with the approval of the bureau, as well as the miners and operators of the State, so that it might be passed without question. The miners and operators appeared before the board in Chicago and agreed on a bill, which was presented to the legislature, and in two or three particulars, I understand, the miners have had it amended, which I do not think is acting in very good faith, as long as it was understood that the bill which was agreed to by both parties should be approved, with the intention of having it passed as recommended.

Q. (By Mr. PHILLIPS.) What kind of mine inspection have you in Illinois now?—A. We have in that State nine districts and nine State inspectors, one for each district, whose duty it is to examine the mines a certain number of times in each year. In addition to that, any county producing—I am unable to tell you the number of tons, I think the law fixes it, though—has a right to appoint a county inspector, who works under the direction of the State inspector. Our inspection laws are good.

Q. What bureau of the State government is the inspection under?—A. Bureau of labor; they report to the bureau.

Q. (By Representative GARDNER.) Is the bureau of labor an independent bureau or attached to some department of the State?—A. It is an independent bureau.

Q. (By Mr. FARQUHAR.) Created by an independent act of the legislature?—A. I believe so. It is composed of five men, who are expected to represent capital and labor. They elect a secretary.

Q. (By Mr. RATCHFORD.) Have you any legislation in your State treating with the mining industry that has been of mutual advantage to the operators and miners alike, as far as you know?—A. Not lately.

Q. Have you had any that has been injurious to either of those parties?—A. We have had some that, if the courts had not declared them unconstitutional, would have been; such as the weekly pay law which they attempted to pass, and other

laws of that class that the courts held were unconstitutional, as they had no right to prohibit the right of private contract under the constitution of Illinois.

Q. Have you any laws in your State as to screening?—A. There is the gross-weight law which originally was declared unconstitutional on the same ground—that they had no right to prohibit the right of private contracts; and the second law passed was practically the same. The decision is peculiar. There is no law, in my opinion, on the statute books in Illinois that would compel a man to pay for run-of-mine coal unless he wanted to, and I question whether it is in the power of the legislature to pass such a law which the courts will sustain.

Q. Has what the law failed to bring about in the matter of the adoption of the run-of-mine system been effected jointly by your association and the miners' association?—A. No; it was brought about by the miners. They compelled the operators in that State to accept it.

Q. What influence was used as a means of compulsion?—A. Nothing but a strike.

Q. Did the operators have to sign the agreement to mine coal on the run-of-mine basis there?—A. We do now.

Q. Where was that agreement signed, and when?—A. It was signed, I think, locally throughout the State during the latter part of 1897. It was signed as a State matter in Chicago in January, 1898. Previous to that time it was local throughout the State.

Q. Was it renewed at any other later date?—A. Renewed in Pittsburg in January of this year.

Q. Still in force?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Could you use screens if you wished to?—A. We could if the men would agree to it. At present they will not agree to it.

Q. (By Mr. RATCHFORD.) Were the operators forced to sign this contract with the miners, or was it a mutual contract voluntarily signed by both parties?—A. The miners in the strike of 1897 demanded the run-of-mine basis and refused to go to work until they got it. It was not voluntary on a part of a large part of the operators of that State.

Q. Was the agreement made in the Chicago convention following the strike of 1897 virtually a forced agreement, so far as the abolition of screens was concerned?—A. Yes.

Q. Was there also a money price agreed to at that convention?—A. Yes.

Q. Was that also a matter of force?—A. No.

Q. Was there any other part of that agreement which the operators were forced to sign that was objectionable to them?—A. We did sign one that I think the larger part of the operators believed when they did it was a mistake, and that was the 8-hour day.

Q. (By Mr. C. J. HARRIS.) Did they refuse to work unless they had the 8-hour day, or was that a matter of agreement?—A. That was the demand conceded by the operators.

Q. (By Mr. RATCHFORD.) Was that demand made by the strike order of 1897?—A. No.

Q. Was it made in the convention that followed?—A. That was one of the demands of the miners which the operators conceded.

Q. Were the miners of your State with whom you were treating at the time of the Chicago convention fairly well organized, and what percentage of them were organized?—A. I could not answer that question. I do not know. We believed they were.

Q. What was the condition of the miners' organization then as compared to the time the strike of 1897 existed?—A. We had every reason to believe that the strike of 1897 had tended to strengthen the organization in Illinois to a very great extent. Parts of the State which previous to that time it was understood had not been organized were very well organized.

Q. Were you treating with unorganized labor more generally during the strike of 1897 than you were at your Chicago meeting that followed in 1898?—A. Previous to 1897 we were. In 1897 we treated with our men in northern Illinois as organized labor. The State, as a whole, did not. I would like to explain why we use the word "force." If a body of men refuse to work—in other words, go on a strike—making certain demands, which the employer refuses to accede to, and the strike continues for a number of weeks or months, as the case may be, and the condition of his property, the demands of his trade, and perhaps the condition of his bank account are of such a nature that he is obliged to resume work at his mines and accede to terms which he had formerly refused and which he did not believe were just, we would consider that he was forced to do it. That is the sense in which I used the word.

Q. (By Representative GARDNER.) What are the objectionable features of the weekly payment act?—A. We pay the men by the ton and the wages are figured out by the ton. The labor of making up the pay rolls is heavy, and it is scarcely practical to make them up and pay once a week. The weekly pay law provided that within 6 days after the end of the week the men should be paid. At Spring Valley we adopted the semimonthly pay day, believing that the men were entitled to their pay at least twice a month. We pay on Saturday, and it takes usually until Tuesday and sometimes Wednesday of the week in which the pay is made for us to get the pay rolls in readiness so that we can get our money. We are obliged to ship the money in, have to order the money on Thursday, get it in on Friday, and put it in the envelopes and pay on Saturday. It was not practical in a large number of districts to pay men weekly for those reasons.

Q. When does the period end for which you are then paying?—A. The month divides in the middle. We pay for the labor performed from the 1st to the 15th inclusive, and the 16th to the 31st inclusive.

Q. At what date does the money actually reach the men?—A. They receive their pay for the work done between the 1st and 15th on the Saturday nearest the 1st day of the succeeding month. The work done between the 16th and 31st is paid for on the Saturday nearest the 15th of the following month.

Q. So that it is nearly 2 weeks back all the time?—A. Yes.

Q. If the object is simply to make the payment cover the time nearer the day on which it is paid only, would it be material whether it was weekly or semi-weekly if it came down to a nearer date? In other words, is it really the weekly payment, or is it the payment covering more recent labor that the men are after?—A. I believe that it is payment for more recent labor that they want. In addition to the extra labor entailed on the company in making up a pay, there is a loss of time due to frequent payment. It was formerly the custom in a great many places for the men not to work on pay day at all. I do not know what the general custom is to-day. By the way, that was not the case with us, because we only shut down at noon; we worked half a day and lost half a day on pay day. The general custom to-day I am unable to answer for. With us, working 8 hours, we make no difference between pay day and any other. We quit work at half past 3 in the afternoon, and it gives everyone an opportunity to draw his pay. It being understood when the 8-hour day was adopted that it meant 6 days a week work for 8 hours a day, we have adopted that and followed it out. In addition to the time lost on pay day—and I think it is lost in a great many sections yet—it has been the experience, I think, of nearly all coal operators, that they were always short of men on the following Monday. A great many men did not come to work. Some of them, perhaps, had good reasons for staying out, and some of them staid out because they did not feel like working. That is the worst objection—the lost time.

Q. (By Mr. RATCHFORD.) Are you speaking of the present time or the recent past?—A. I am speaking of both.

Q. Have you any cases in mind where you know that the miners will not work on pay day?—A. No; I have not now. I meant in regard to the taking of Monday as well.

Q. Have you any cases in mind where they will not work and force the mines to be idle on the Monday after pay day?—A. There are a good many of my own men who do not come to work on Monday after pay day.

Q. Are your mines idle that day?—A. Oh, no; we run part; we are not able to run full.

Q. What proportion or percentage of your men follow that custom?—A. I could not tell you that.

Q. (By Mr. C. J. HARRIS.) Is not that a general complaint among the coal mines or any other?—A. It is a general complaint; yes.

Q. (By Representative GARDNER.) If the pay day could be made to cover labor performed one week later than it does now and still come semimonthly, that would relieve it of the objection of the frequency of pay day.—A. Yes; but it is not practical in large mines.

Q. Is yours the only locality where the 8-hour day has been established?—A. It is established in mining pretty generally in four States. There are mines in part of the States that are still working 10 hours a day.

Q. Has the 8-hour day gone into effect in your time?—A. Yes.

Q. So that by observation you have seen both?—A. Yes. The demand for the 8-hour day came from the miners, and it was conceded by the operators. I doubted the wisdom of it at the time and I do yet, for this reason: A large percentage of the men employed in the mines are working by the ton, and the man who is working by the day, while nominally he agreed to work and did work for

a while at 80 per cent of the former wage—in certain lines they did that. The result was what we all expected, that in time he would be getting as much for 8 hours as he formerly did for 10; and the outside laborers, I think, are very largely getting as much for 8 hours' labor as they did for 10. They are not underground, as a rule, and the former agreement still stands as to underground day labor. To the day men, in the long run, I believe it is an advantage, but I have been unable to see where it is to the advantage of a man working by the ton to agree to reduce his possible earning capacity 20 per cent.

Q. Has that been the result?—A. It reduces his possible earning capacity 20 per cent, yes. He can not do in 8 hours more than four-fifths the work, speaking in general terms, you understand, that he could in 10.

Q. Do you know what the comparative earnings of the men mining by the ton are under the 10-hour and 8-hour system?—A. We know what the rate per ton is. I am not saying that it has reduced his earnings; I have not said it did reduce his earnings that much, but I am saying that it reduced his possible earning capacity.

Q. (By Mr. RATCHFORD.) Has the output of the miner been reduced 20 per cent?—A. That I can not answer. I think in many sections of the country that the men have mined just as much coal working the 8-hour day as they did in 10, on account of the possible capacity of the mines being a great deal larger than the demand. Take the past March, when we ran our mines as full as the car supply would admit of, and that was almost continuously, and compare it with March of last year, when the conditions were practically the same, except that at one time we were working 8 hours and the other 10. In March of this year we produced about 94,000 tons of coal as against almost 102,000 tons during March of the previous year. We had increased our ability to handle coal at one mine by the addition of a double-decked cage in place of the single decked, which enabled us to hoist 2 cars at a time instead of 1 and gave us an opportunity to get out more coal in a given time than we could before. Whether those men mined more coal I am unable to say, because I do not know the number of men at work in the two different periods.

Q. Had you the 8-hour workday through your State last year?—A. Almost all over the State; there is a part of it working 10 hours yet.

Q. The year previous did you have 10 hours?—A. Yes.

Q. Has the product of your State during the past year been reduced 20 per cent or has it been increased?—A. None of us can answer that definitely because the statistics are not yet in.

Q. Are the advance sheets out?—A. Not for the last year. We do not report in our State until July. The reports cover from July to July in our State. If I answer that from what I believe, I should say that there was more coal produced in Illinois, but it is hardly a fair comparison because in 1897 we were on a strike several months. In a general way, I believe, the trade has been better during the past year than it has been at any time since 1893. The general condition of business has been better, and I think the demands for coal have been better than they have been for several years.

Q. Do you believe the product has been greater?—A. It is only guesswork; I believe it has, yes.

Q. Did the product of your State fall off in 1897, because of that strike, compared with the output of 1896?—A. I can not answer that question.

Q. Did it fall off in all other States, compared with 1896?—A. I can not answer that question. Now, I really believe that the men in Illinois, take them as a whole, during the same months of 1898 and 1899, as against the months they worked in 1897 and 1898, on the 10-hour day, earned better pay, and that has been due to improved trade conditions; but you take it in a large part of that State and the mines were able to produce a great deal more coal than they could find a market for. Capacity has been developed beyond the demands of the business. I think that is generally true of coal mining throughout the competitive States.

Q. (By Mr. PHILLIPS.) If the men work underground 10 hours per day, would they not be excluded almost wholly from the sunlight?—A. In the winter they are.

Q. Have you observed any effect on the physical condition of the men?—A. I really believe that the 8-hour workday for the miner, if he is willing to reduce his possible earning capacity, is to his advantage—to the advantage of his health—and I do not believe that it is any disadvantage to the producer of coal, and, provided it should be made uniform throughout the country, I would strongly favor it. But it has been local, to the disadvantage of people who are producing coal in competition with districts where they were still paying 10 hours for 10 hours work. It has been to their disadvantage locally; that I do not think can be gained. I honestly believe 8 hours is as long as a man ought to work under ground if he can earn a living wage during that time, and whenever the 8-hour workday

for mining can be made effective throughout the country he can earn just as much money working 8 hours as he did working 10.

Q. You have a strong suspicion that he is aware of that, too, have you not?—A. I never thought of it in that way.

Q. In that connection, have you ever talked to all your men?—A. No; just as I would pick them up indiscriminately, and on the street as I would meet them.

Q. (By Mr. FARQUHAR.) Is this agreement on the 8-hour day an agreement between the coal operators and the miners without State legislation of any kind?—A. There was an 8-hour law passed, I think, in Illinois at one time, but that met with the same objection, I believe, from the supreme court that other legislation of that class has—an attempt to prohibit the right of private contract. This arrangement of the 8-hour day was not brought about by any legislation, but by agreement between the miners and operators.

Q. As to the proportion of labor and capital in the industrial products, what have you to say?—A. I have nothing to say on that subject.

Q. Have you anything to say on the character, extent, and effect of taxation in different States?—A. I have only one thing to say: In Illinois (in certain parts of the State I do not think it is done) they are now attempting to tax mining rights; whether there is any law for it I do not know; we are paying the taxes. We have believed that it is unjust for this reason: We buy the coal underlying a farm. We suppose there is coal there; there may or may not be; you can not always tell; and they attempt to assess a value on that and have us pay taxes on it; I do not think that is fair. The theory is that they will reduce the assessed value of the surface land to the same extent to a like amount, but we do not find that they do. We find that where we own coal under the land the surface is assessed at the same price as the adjoining land owned by a farmer. We do not believe that the assessment of a mining right is a proper assessment. We buy the right to mine the coal. That is, we buy from a farmer that owns, say, 160 acres; we pay him for 160 acres of coal, assuming that he has it there; but we have no right to take that coal out from his property without afterwards buying from him the surface rights necessary.

Q. (By Mr. PHILLIPS.) Do you fix the price for that in making the bargain?—A. No; that is done when we want to use it; we make no bargain for it when we buy the coal.

Q. (By Representative GARDNER.) You do not think the mining right ought to be assessed?—A. No; unless they can prove that the coal is there.

Q. Suppose the mine is opened in the meantime; how are you assessed then?—A. Just the same. If our company owns the mining rights around the mine, we are assessed for the coal there. If we own it 10 miles away where we have never had a drill hole or an opening and may not have one in 50 years, 10 years, or 5 years, and may never be able to find any coal, they still assess us, because the records show we have deeds of the mining rights.

Q. (By Mr. FARQUHAR.) Is the assessment on the general profits?—A. I have tried several times to learn how it was assessed. I went down and asked the State board at Springfield and they could not tell me. It is not uniform throughout the State; it is only done locally.

Q. (By Representative GARDNER.) You do not believe it is right to assess property under the earth that the assessor does not know exists?—A. No.

Q. That is he knows nothing about its value until the mine is opened and the deposit discovered, the value can be nothing more than nominal?—A. That is all.

Q. What is the rule in Illinois as to assessing mines?—A. In our section of the State, in some townships, they assess mining rights where we have simply the deed for the right to mine coal, they assess that at so much an acre. In other sections, in other townships, they do not assess at all. They will assess us for all the personal property we have, the same as assessing any other corporation or individual. They will assess for the machinery we use, for the buildings and for the land we have, for the pit cars, and all the appliances connected with the mine. And we have had assessors who simply put a lump sum, an arbitrary sum, on a certain piece of land because a coal shaft was on it, sometimes very much in excess of any value that should be placed on it as compared with other assessments. Those things the local assessors are to blame for and not the law. In our State, you know, there are no State assessments; it is all made by the local township assessor.

Q. (By Mr. FARQUHAR.) In the State of Illinois does the county board of supervisors correct this assessment, spread it over the property in that district?—A. The former practice was for the assessor to assess values and fix them himself; that is, he was supposed to do it. You take stock and those things; the assessors would meet in the county seat and would say we will assess horses for so much,

and we will assess cows so much, and so on, and then they would go out and make their assessments. And the party owning the property had a right of appeal from the assessor to a town board composed of the supervisor, the town clerk, and the assessor; from that he had a right of appeal to the board of supervisors of the county, from which there was no appeal. The new law went into effect last year, but I am not well enough acquainted with it to explain it, but it changed things materially. The party to be assessed is now supposed to fix the value of his personal property himself and swear to it, and the assessment is to be one-fifth of that.

Q. (By Mr. RATCHFORD.) Have you any suggestions for the modification of such tax methods?—A. Nothing, except that I do not believe it is fair to fix a value for assessment on a piece of property no one can see and that no one is able to say exists.

Q. (By Representative GARDNER.) Are they bought and passed for a consideration?—A. Yes.

Q. (By Mr. RATCHFORD.) What can you say with reference to discrimination in freight rates?—A. I guess the Interstate Commerce Commission is looking after that pretty well nowadays. The interstate-commerce law says that no interstate rates shall be greater for a shorter than for a longer haul, I believe.

Q. Have you anything to complain of in transportation rates?—A. I have a complaint regularly with the railroad company on something; it is a part of our business. I think that the interstate-commerce law in regard to freight rates has been to the advantage of the public generally, certainly to the advantage of the shipper; more to the advantage of the shipper than it has been for the consumer.

Q. Have you any knowledge of discrimination being practiced in transporting the product of the mines?—A. No.

Q. Have you heard it complained of?—A. I hear these complaints, but where we are located we have the only mine located on the Chicago and Northwestern road in Illinois, and we have no one to complain of locally.

Q. (By Representative GARDNER.) No local competitor?—A. Not particularly. Of course at all junction points we meet them, and there it is a matter of agreement either with the railroads as to what the rates shall be, or in case they do not agree they will make us a rate and we must either sell coal based on that rate or stay out of the market. We find the railroads disposed to be fair in that matter and we have no complaint to make about it. The complaint that the coal trade generally is making on freight rates to-day is the low rate made from West Virginia to the Northwest, which is proportionately a very much lower rate than we get in our section of the State. We complain about that, but I do not know any way to regulate it; and we complain to the roads of the rate of freight we are obliged to meet in northern Iowa from local mines in Iowa. Those are things the railroads have to fix the best they can.

Q. (By Mr. RATCHFORD.) Is that complaint as against the freight rates of West Virginia of a general nature? Do the other operators of other States complain of it?—A. I think that is generally complained of; yes. For instance, I am told that the freight rate from certain West Virginia mines to St. Paul, Minn., is \$2 a ton. The rate from our mines to St. Paul is \$3 a ton.

Q. From northern Illinois?—A. Yes. The general rate from northern Illinois, however, is a dollar and a half. Our rate to St. Paul is 50 cents higher than that of other mines in that part of the State.

Q. What is the reason for that?—A. The coal from Ohio and Pennsylvania has driven us from St. Paul, and we do not care whether the rate is \$2 or \$5; we can not get it. We have not pressed for a reduction in the rate, because I do not think, unless it was some special case, I could sell coal in St. Paul, anyway.

Q. (By Mr. CONGER.) Is this rate from West Virginia to St. Paul a rail or part water?—A. Yes; in a sense it is an all-rail rate. It is a rate made to a certain point on the eastern shore of Lake Michigan, and the cars are thence transported across the lake on what they call lake ferries; the cars are transported across the lake without breaking bulk and taken up by the railroad and carried through.

Q. Is not this exceedingly low rate from West Virginia probably brought about by being part water transportation?—A. No; I do not think it is.

Q. (By Mr. PHILLIPS.) They give the West Virginia operators lower rates than they do the Hocking Valley or the Pittsburg, in order to reach the lake?—A. No; I am inclined to think that the ferry would only be allowed a fair proportion of that through rate.

Q. Does this rate remain the same winter and summer?—A. I do not think the rates change, although there may be times when they can not transport coal across the lake.

Q. Have you ever heard of any lower rate from West Virginia to, we will say, Lake Erie, and there by vessel to Duluth, than to put it into cars and ship by rail

to St. Paul?—A. I think it has been; yes. That is common talk—that it is done; I have never seen it done myself.

Q. In that competition what fixes the rail rate from West Virginia to the Northwest?—A. I presume that it is an attempt to compete with part rail and part lake freight.

Q. (By Mr. FARQUHAR.) Are you one-third closer to St. Paul than West Virginia is?—A. Oh, yes. Our mines are perhaps 400 miles, in round numbers, from St. Paul.

Q. (By Mr. PHILLIPS.) How far is it from Charleston or Wheeling, W. Va., to your mines?—A. I have to guess at that; it must be 800 miles.

Q. (By Mr. C. J. HARRIS.) About three times the distance it would be from your place?—A. I do not think so, by the route they take. I think, perhaps, 1,000 miles against our 400 would be nearer right.

Q. (By Mr. KENNEDY.) How far are your mines from Chicago?—A. One hundred and four miles. We do not go by lake.

Q. (By Representative GARDNER.) What road takes the West Virginia coal to the lake on this through rate of \$2?—A. I can not tell you.

Q. What road takes it west of the lake?—A. The Wisconsin Central is now doing it. I do not know whether there are any others or not.

Q. Would these roads have other coal in large quantities to haul if they did not haul West Virginia coal?—A. I do not know why they could not get a portion of the coal that comes in by lake.

Q. Is it true that if those roads did not haul that coal they would have none, or very little coal, to haul at all, and that the low rate is made in order to get business and enable the companies to compete in that far Western market?—A. I can not answer as to the roads east of the lake.

Q. (By Mr. RATCHFORD.) Is it true that the coal roads entering the State of West Virginia and transporting her product to the lake and to the Northwest also enter the mining fields through the State of Ohio, from which State that product is transported?—A. That is true, with one or two exceptions.

Q. So that they have the product of both States to take to the Northwest?—A. That is the initial road. Shortly after this \$2 rate was published I saw the general freight agent of the Wisconsin Central and asked him how they could afford to do it, and he said he had been unable to get the operating department to tell him the difference between the cost of hauling a loaded and an empty car, and that was all he said.

Q. Is discrimination regarded by the coal men as being injurious to the trade?—A. This low rate from West Virginia has injured us very materially.

Q. Would that not also be true of any other State, if it existed?—A. Yes. You take it locally, and, so far as I know, there is very little discrimination between the mines located on the same line of railroad. I think they are usually given for the same class of business about the same rate of freight.

Q. Do you think it tends to disturb the conditions of the trade, prices, and in that way give rise to labor trouble?—A. I do. This low rate from West Virginia does undoubtedly.

Q. (By Representative GARDNER.) Do you think this discrimination is the result of railroad competition in that case?—A. No; I do not. I do not believe there is any other combination they could get up that would pull coal that distance and do it for the money. I have never dealt with roads that would, at least.

Q. Is there anything in the intimation that they have the loaded cars to take back to West Virginia?—A. I can not answer that. I have not been over the roads, and I do not know the condition of their traffic.

Q. (By Mr. PHILLIPS.) What is the cost of mining in northern Iowa, as compared with your section, and the value of the product there?—A. I can not answer that, because I do not know exactly the rates they pay, nor the screen they use. The price they obtain at the mine is usually reported to me by the traveling men, who will say the coal from the Iowa mines at such a point costs so much, and we can not compete, as our prices are higher. It does not bring me down to the actual cost of producing it.

Q. Is it better or worse than the coal you mine?—A. I do not think there is any coal in Iowa that is as good as our northern Illinois coal; but the locality gives them an advantage over us, as their location enables them to get into certain markets against Pittsburg, which has better coal than we have.

Q. (By Mr. RATCHFORD.) What have you to say of concentrations and combinations in your trade and their effects?—A. In a combination of properties, whether mining or manufacturing, the intent is to reduce the cost of management and the general expenses, and, if they can combine a sufficient number of industries, to increase the selling price of their product. Temporarily, at least,

it may be a good thing for capital; temporarily, it might be a good thing for a certain part of the labor; but the tendency is to throw out of work a large number of men who have been keeping books, who have been selling, who have been managing properties, and in very many instances owners of certain properties which were not as productive possibly as others, and throw out workmen, and I look upon the whole movement as being wrong. I do not believe in it; I do not believe in a trust. I do believe in men in the same line of business getting together and trying to arrange prices so as to get a fair remuneration for the product they have to sell, but I do not believe in a trust. I think it is contrary to our American ideas. It has a tendency to destroy competition and to limit the number of men employed. It is a menace to the country, and I think would be a dangerous one were it not for the fact that the American people have a way, when the proper time comes and things become unbearable, of rising up and facing them and putting them in their proper places. Only for that I would look upon this movement of forming trusts as a danger to the Republic.

Q. (By Mr. PHILLIPS.) Are your coal fields in Illinois in trusts and combinations?—A. No; so far as I know, they are not.

Q. (By Mr. RATCHFORD.) What have you to say on the subject of producing capacity and economic effects of modern machinery?—A. In our work we do not use mining machinery. We have never yet been able to find machinery that we believed was adapted to our particular class of work. I see no reason why it is not to the advantage, in the long run, of not only the producer but the wage-earner, to improve the mining machinery just as it has been in improvements of all machinery in all classes of manufacture; I can not see why it is not to their advantage. Temporarily it undoubtedly gives the operator who has machinery an advantage over the operator who is not possessed of it. I see no reason why under ordinary conditions the man who has not machinery should not put it in and be in position to compete with his neighbor who is progressive. That is perhaps to the disadvantage of the property that I operate, because we are unfortunate in not being able to get machinery. This is as I see it, as I look upon the question.

Q. Do you look upon the advent of machinery in the mining trade as something beneficial to all concerned?—A. I think in the long run, yes, to the large majority.

Q. Are you of the opinion that the prices fixed as between hand and machine labor are relatively fair?—A. I can not answer that question; I never used machinery and I do not know.

Q. When you stated that the man who employs machinery has some advantage over his neighbors who do not, were you speaking of operators?—A. Yes.

Q. If it be a disadvantage to his neighbor in the way of taking any portion of his business of producing coal at a lesser price, is that disadvantage also carried into the miners' side of the question?—A. Yes; it affects both alike. I believe, on the whole, that in mining, where machinery has been introduced, it is in that particular mine to the advantage of the operator and the miner alike, or the men operating the machines. That has been the impression or opinion I have formed in talking with people who are informed on that subject; I am not personally.

Q. Have you any statement to make on overproduction or underconsumption, and their effects?—A. The cause of overproduction is opening too many mines; the cause of underconsumption is because people will not consume it. I can not give you any better answer.

Q. Have you anything further to say on industrial and remedial legislation?—A. I do not believe in employers' liability laws that compel the employer to assume the ordinary hazards of a business. I see no objection to liability in certain cases, but I do not believe in any liability law that would hold an employer liable for an accident which might be due to the neglect of an employee to take the necessary precautions for his protection, or for any accident that might befall him if he was violating either a law of the State or a law or a rule adopted for the government of the men. I do not think the employer ought to be held liable.

I do not believe that laws can be made too stringent for the protection of life. It has been our practice to adopt anything that looked to protection of life or limb. I am in favor of any fair law that will protect life; any law that can be enforced; any legislation they can pass, or anything they could throw around an employee, which will tend to protect life. I believe in it.

I think that the mine inspection laws should be rigid, as we have attempted to make them in our new mining law in Illinois, and that the inspectors should be men thoroughly competent, and men, if it was possible to get them, who were nonpartisan, who were beyond the control of any political party that might for the time being be in power.

I have always favored the employment of a check weighman, not because I believe, under ordinary conditions, miners gain a cent by it, for I do not believe the employers of labor are men who are trying to cheat the employees, but it satisfies the men that they are getting pay for their work, and for that reason I have made it a practice to insist on our men having a check weighman, and when they neglect to hire them, I have gone so far as to say they must furnish a check weighman within a certain number of days or we would close down.

I am inclined to think that children are allowed to go to work too early in life. I think the law of our State says 14 years. I do not believe children should be allowed to go to work in a factory or mine under 16 years of age. I think they should have at least that time to develop mentally and physically, or perhaps a longer time.

I am unable to say anything on the school laws; I am not well enough acquainted with the subject, except this: I believe in the common school, and believe in doing as much as can be done to improve it. No tax that I pay, either personal or for the company, do I pay as willingly as I do the school tax.

I do not believe personally that the run-of-mine law or run-of-mine agreement between a coal producer and employees is a good thing. I look upon the gross-weight law, as it is called—that is, the run-of-mine—as being a premium on bad labor. I have always believed so, and believe so still. I know in my own experience that the better class of our men were better off under a screen rule than they are to-day, where they are paid for run-of-mine coal. On the other hand, I know that the poorer class of workmen and the dishonest workmen are better off under the present law. I believe that in the interest of the better class of workmen, the more intelligent workmen, a screen law, a uniform screen law, throughout the United States, rigidly enforced and maintained, would be to the advantage both of the employer and the intelligent, honest employee.

Q. To what extent would the variation in the nature of the different coal veins operate against the justice of a uniform screen law?—A. I do not think it would work any injustice.

Q. Some of your coal veins are much softer and some harder than others.—A. That does not change the cost at all, because the present run-of-mine rule was based, when it was fixed, upon the percentage of slack that was produced over the screen.

Q. Do you believe in a uniform screen brought about by law, and the price of mining being determined for the coal passing over that screen, based upon the amount that passes through it?—A. I think that is to the interest, not only of the employer, but of the intelligent, honest employee.

Q. (By Mr. CONGER.) Does your belief in a uniform screen law entail a uniform price per ton for mining in all mines?—A. No; that would have to be obtained by finding out the percentage of slack coal that would go through the screen, the thickness of the vein, and everything, just as it is found out now. It would not change the regulating of the price.

Q. It would be affected by the soft and hard conditions of the coal.—A. Yes; just as it is now. We do not operate a company store ourselves. When I went to Spring Valley 9 or 10 years ago, the president of the company, Hon. William L. Scott, now dead, said: "We have a store in Spring Valley, Mr. Dalzell, put in there for the accommodation of our employees." At the time it was put in I understand there were no other stores in town. I think the president said—it may have been the secretary; it was between them, at least: "We do not propose to allow merchants in Spring Valley to make prices on goods, and we are going to run the store in the interest of the employees as far as possible, and we will make the prices on the goods that are sold in Spring Valley," and we did. It ran on until 1894, for the amount of business done there was comparatively at a small margin of profit, and Mr. Taylor, who became president after Mr. Scott's death, said to me: "I think the miners complain so much about company stores that we will sell our store; we will quit; there is no money in it; we are in the coal business; we will close the store; we do not now derive any profit from the store except the rent of the building." It is still run in connection with the company, and the men buy coupon books on the store, if they wish, which are honored just as cash; and twice a month, instead of giving the money to the miner we give it to the storekeeper, and in giving him business the only condition we make is that if we find him charging exorbitant prices we will discontinue the arrangement.

Q. Is the company paid any percentage for honoring those coupons?—A. Not a penny. I think I said that before.

Q. No connection with it?—A. No interest in the store whatever. We own the building; we lease the building to the party, and we give him the cash on pay day instead of giving it to the miner, exactly the number of cents the miner

would have, without any discount of any kind. I think that in a good many localities and under a good many conditions company stores are an advantage. Company stores in some cases are very much to the disadvantage of the miner. Where an employee is coerced into dealing in the store it is wrong, or where he is asked to pay a higher price for his goods than he would be asked to pay at an outside store it is wrong; but where a company store is operated as we operated ours, the men had the privilege of trading there or not, as they pleased. It was to their advantage.

Q. You say an employee was never asked to deal there. If there were no other stores in the town and no other town or stores adjacent to that place, was it necessary?—A. That was only when the property was opened.

Q. Could you state whether the effect of the company store generally is injurious or beneficial, in your judgment?—A. I can not; because there are two classes of employers; I can not divide them. I do not know how many treat their employees fairly in that respect and how many do not. If the stores are operated as they say they are operated in West Virginia, I would say they are very much to the disadvantage, not only of the employee, but of the coal trade generally. If they were operated as in Spring Valley, they are much to his advantage.

Q. Have you anything to say on the laws regulating mediation and arbitration?—A. Yes; I have a very decided opinion on that. If it is possible to get legislation to cover it, I believe it a sensible way to settle differences between capital and labor by means of mediation and arbitration. I do not believe in strikes; I do not believe, as a rule, there is occasion for a strike. I do not think it is a good thing for capital or labor. I think on the whole that both are losers by it, and if the figures could be obtained I think they would prove that strikes, particularly in the coal industry, have been a loss to both parties, take it right through. A strike is a good deal in the nature of a man meeting one on the highway with a club and telling him to stand and deliver. It might have done a hundred years ago, but in this enlightened age a strike means a loss on the investment; on the use of the money and damage to the property on the one hand, and on the other hand the loss of the employees' time, which, when lost, he can never regain; a day lost we never pick up. We are only going to live in this world once and only a short time, and we want to keep busy at what we are doing while we are here; if we don't we never can make up for the lost time. I am inclined to think that even without legislation, capital, at least, and, I hope, labor, have gotten to the point where they should be willing to settle their disputes amicably: if they can not do it among themselves, by arbitration.

Q. Do you prefer voluntary arbitration boards jointly chosen, or by the States, or a compulsory arbitration?—A. I do not believe in compulsory arbitration. I think "A man convinced against his will is of the same opinion still." I have given the subject of arbitration a great deal of attention and I must confess I do not know what the remedy is. I have every law, I think, that has ever been passed in this country on the subject. I do not know what to say is the proper remedy. If a law could be framed that would form a nonpartisan board, permitting of voluntary arbitration or of the selection of boards outside, if they desired, and that would compel the carrying out of the work of the board where both parties had joined in asking for it, it would be a good thing. The difficulty about arbitration to-day is that on the one hand you have capital, which can be compelled to carry out its agreements; on the other hand you have the labor organizations, which you can not compel, as they are not incorporated; and, in order to get them on an equal basis, I believe that a labor organization should be incorporated and have a paid-up capital proportionate to the members of the organization. This does not apply to coal mining alone, but for any class of labor. In other words, that the labor organization which was not incorporated and did not have the paid-up capital required should not be allowed to interfere. I believe that if all labor organizations were compelled, in order to exist, to incorporate and have a paid-up capital, and deposits with the State, either in cash or in bonds, as insurance companies are obliged to put up their securities in the State in which they are operating, they could be sued just as capital can, and it would be a long step in the direction of avoiding strikes. That, with arbitration, should do away with strikes.

Q. (By Representative GARDNER.) What you are getting at is legal responsibility, is it not?—A. Yes.

Q. In view of a general scheme of arbitration, if trade unions were incorporated with sufficient capital to make them responsible, would it not be true, first, that the employer would agree with the labor corporation for employees; second, that the labor corporation, in order to protect its capital, would be compelled to have contracts with its individual members; third, that the labor cor-

poration would be compelled to seek remedies against its members which the employer would seek, if liabilities were equal? Hence (a), would not the relation of employer and employee be brought about between the labor corporation and its members; (b) would it not become necessary for the labor corporation to be able to compel specific performance by extreme remedies?—A. I think I can answer one of those, that is, the first: I would say, yes. The other questions would be a matter for the labor organizations to decide for themselves, and I would not like to pass upon them. That would be a question for them to decide, not for the employer.

Q. (By Mr. CONGER.) Has it occurred to you that in case the labor organization refused to carry out the award of a court of arbitration, in addition to confiscation of its capital, canceling its charter might be made the penalty?—A. That might be made the penalty as well, and if that was done and there was no organization, the law of necessity would have to be strong enough to prohibit an organization without a capital; then the organization could not afford to refuse to carry out its agreements, because it would not only be liable, as you say, to cancellation of its charter, as any corporation is, but would be liable for the damage either as fixed by the board of arbitration, which might say to the capitalist and to the laborer, if you do not carry it out you will have to be fined so much; or it might be done in the courts.

Q. The forfeiture of the capital stock of the organization, and the possible forfeiture of their charter, in your idea, would bring about more pressure on the members of the organization, which would put them at work following the award of the court?—A. Yes, as it would the capitalist.

Q. (By Mr. PHILLIPS.) To prohibit an organization of men, unless they were capitalized, would a law have to be enacted?—A. Certainly.

Q. Would that be legal?—A. I am not sure that the combination of labor is not as much of a trust as a combination of capital.

Q. (By Mr. KENNEDY.) Is there not an almost insurmountable obstacle in carrying out your suggestion in the fact that the miners, for instance, and other labor people, get such a small wage that they can just barely live on it, and it would be out of the question to form a capital?—A. I hardly think so. While it is only hearsay, I understand that the miners' organization in Illinois has over \$50,000 in cash in its treasury.

Q. (By Mr. RATCHFORD.) You are inclined toward the incorporation of trade unions?—A. That was simply a suggestion.

Q. The purpose is to secure the observance of all contracts made with the organizations?—A. By both parties.

Q. Do you suggest also the incorporation of the employers' organization?—A. No; because you have the remedy against the individual employer, who is responsible.

Q. If the employers who met the mine workers in Pittsburg last January saw fit to violate the contract made there, has the miners' organization recourse at law?—A. No; because the miners' organization has no standing in law, as I understand it. They are not an incorporated company.

Q. As individuals, each miner has some redress at least.—A. Certainly.

Q. If the miners' organization had a standing in law and the operators' organization were constituted as at present, would they then have recourse at law?—A. Against individuals they would.

Q. Have individual operators signed this agreement?—Yes; they have.

Q. Does the association of operators that now meets and does business with the miners' association have any more standing in law as an association than the miners?—A. No. But the parties forming that organization have a responsibility which the miners who form the other organization have not.

Q. But has the association of operators?—A. You are working on the wrong line; I have not said that it was the proper thing. I have simply offered a suggestion, and only having offered a suggestion, I would not like to say it was necessary, that causes were sufficient to warrant it, when I have not said it was necessary to do it.

Q. Have you, in your experience as a coal operator, known of the miners' organization, State or national, to voluntarily agree to arbitrate, and reject its terms?—A. No.

Q. Have you known of the operators in any case to do so?—A. I have heard of one case, but there was a dispute by the operators as to the scope of the arbitration; and that was in the Virden district, Illinois, but as I am not informed of the facts, I can not tell you whether that is right or wrong. Those people refused to carry out or abide by the agreement made in Chicago, and withdrew from our association. When they withdrew they were simply dropped.

Q. Is it pretty well understood in your State by both miners and operators that each party to the Virden dispute voluntarily placed the matter in the hands of the Illinois State Board of Arbitration?—A. I understand they did.

Q. Is it true that that decision was in favor of the miners and that the operators refused to accede?—A. They took exception to the arbitration, in the way it was done. They claimed it did not cover the ground to which they agreed.

Q. When were these exceptions taken; after it was arranged?—A. I can not say.

Q. In speaking of the incorporation of these two great bodies, capital and labor, employed in mining, you suggest that such be done in both cases as a means of forcing respect to all contracts made in every trade?—A. If it was done, that would be the right idea.

Q. Have you ever given any consideration to the difficulty that might be experienced in bringing it about as you suggest—capitalizing labor organizations?—A. I do not know why there should be any particular trouble.

Q. Would not that be one of the insurmountable things?—A. I do not think there would be any trouble at all, if it was the desirable thing to do.

Q. (By Mr. FARQUHAR.) Do you think that arbitration, when made by two parties in interest, operators and employees, is better than arbitration brought before a constituted board of arbitrators, a board ignorant, often, of the technicalities of trades or business?—A. If the State board is a political board, I should not want to submit a case to it, even if I knew I was right.

Q. Could you find a State board of inquiry in the United States to-day that could take up a technical question belonging to labor and give a fair and judicious opinion on the troubles that caused the strike?—A. I do not know. I believe this: If an arrangement to arbitrate legally could be made, it would be preferable to any State arbitration board you could get; each party selecting the arbitrators.

Q. Is it not the usual experience in these arbitrations that one or the other think they are unjustly treated, and when so, it gives occasion for the first outbreak?—A. Well, I presume that would be true; I have had no experience and can not answer that question properly.

Q. (By Mr. RATCHFORD.) Would you care to state whether the miners engaged in the Virden strike, and also in the Pana strike, are fighting for a price arbitrarily fixed by the organization or a price mutually fixed by miners and operators of your State?—A. A little explanation of that, perhaps, would be better. At the time the Illinois Coal Operators' Association was formed, in the fall or winter of 1897, we appointed a committee to take up and fix what we believed to be a fair differential in mining prices for Illinois. For that purpose we divided the State into some nine different districts, and selected men from each district on this committee. They took the matter up and worked over it for a good many days, spent a good deal of time over it, taking into consideration the expense of mining the coal in the different districts, the earning capacity of the mines in the different districts, the relative position in regard to freight rates and market conditions, so as to come as near as possible in fixing a wage scale that would put each operator for each district in a position to compete against the other. As a result of that, the differentials were fixed in the State on the part of the operator. After the interstate convention in Chicago we met the miners in State convention and submitted what we believed to be the fair differentials between the different districts. They appointed a committee; they had, in many instances, different ideas, but the result was, when we were through, that the miners joined with the operators in adopting the differentials which the operators had fixed for the State; the people of the Virden and Pana fields opposing it all the time, and the operators left our association and said they would "paddle their own canoe," to use a homely expression, refusing to pay the price agreed upon between the miners and operators. Those are the facts in the case.

I know nothing of convict-labor laws.

I believe that uniform mining laws, so far as varying conditions would permit, would be proper. It would be a good thing. The conditions in mining in different States might make that an impossibility, requiring in one State what would be objectionable, perhaps, in another.

Q. Have you any suggestions to offer as to legislation?—A. No.

I have a very decided opinion on relations of nonunion labor and rights of liberty of contract. I believe that the employer should be allowed to employ any man he pleases who he thinks is competent to do his work, regardless of whether he is a member of a labor organization or not. I further believe that when a labor organization attempts to say that a man must belong to the organization in order to obtain work, it has exceeded any right that any man or any association of men should assume.

Q. Does the miners' organization, State or national, deny that right by resolution or constitution, or by any of their principles?—A. When I finish the statement, I think you will have the answer you want. I believe that it is wrong for a labor organization to attempt to coerce any man to join the organization contrary to his own free will. I believe that every man in this country should be at liberty to sell his labor at the best price he can obtain, individually, if he prefers doing it that way to doing it collectively. I think whenever a labor organization attempts to compel men to join the organization or force them in any way, that they are then making out of those men slaves, as you [addressing Mr. Gardner] talked about this morning. When you take the liberty of action away from him you convert him back to his original position. We have treated with labor organizations. Perhaps I have not made it clear; I have not said that I did not think a labor organization was a necessity or that it was a good thing of necessity. I believe at times that it is a good thing for both employer and employee—up to a certain point. We have believed that the miners' organization, as now constituted, was a good thing to treat with, and have treated with it as an organization. How long it will remain I am not prepared to say; that is for the miners to say. I favor going into convention, either national or interstate or State, and agreeing with labor, if we can do it, to do certain things and carry them out, and up to that point I think it is the best thing labor and capital can do. When it comes down to a question of meeting in an interstate convention, spending a couple of weeks making your agreements, going home and having a State convention, spending a couple of weeks more trying to agree on things you supposed you had already agreed on, then going home and spending two or three days locally rehashing things you thought you had already agreed upon, interstate and State, it is a question whether there is much gained. One settlement ought to settle it. I do not know the constitution of the United Mine Workers, as I have never seen a copy of it. I understand the sessions are secret. I do not know anything about what they have or have not done. I do know this, that in the State of Illinois—I do not care to say where—operators have told me that men stood at the mouth of their pit and demanded to see the union cards of their employees before they would allow them to go down the shaft to work. Whether that is by the authority of the national or State organization I do not know. I have no means of knowing.

Q. Have you ever requested that a copy of that constitution be sent you?—A. I have not, because I did not suppose I could get it if I did.

Q. Is it a fact that the coal producers at times enter into mutual agreements to maintain a certain price for their product?—A. That is done occasionally, locally but not nationally, and, with the possible exception of Ohio, I think, where they tried to do it, I do not think it has ever been tried by a State. The interests are so diverse and the markets so diverse in any particular State as a rule, with the possible exception of Ohio, that it is almost impossible to do it.

Q. What do you know of the Pittsburg field in that regard?—A. I have heard they talked of it.

Q. Is such an understanding in operation in Danville, Ill.?—A. That is only a few mines in one district. They have there, I understand, one company that sells the coal from that field.

Q. Is such an understanding in operation in almost every mining district mining the same coal and where conditions are equal?—A. Not in Illinois. I do not know how it is in the other States.

Q. You said that such has been the case, at least, in one or two instances, and, in view of that concession, where is the consistency in saying that labor has not an equal right? You say that the laborer should be free to contract individually as he pleases?—A. Certainly, but I believe in each coal operator having the same right.

Q. Has the laborer that right?—A. I do not know how far your organization controls him.

Q. You do not deny that he has that right, however?—A. I do not.

Q. (By Mr. C. J. HARRIS.) If they object to those men going down the shafts, they certainly would not have that right, would they?—A. They would not, in that case.

Q. That is not a common occurrence in your State?—A. I really could not answer that question. I have only heard two or three operators speak about it.

Q. (By Mr. CONGER.) Is that the condition at your mine?—A. No.

Q. (By Mr. PHILLIPS.) In a case where there is no labor organization, and a man employs say 100 to 500 men, how do you arrive at the price; does the company fix it arbitrarily, and the miner agree to what the company fixes?—A. In northern Illinois for a number of years previous to the present, or for a time at

least, while I think nominally there was an organization, I do not believe it had any binding effect or amounted to very much; that was my understanding of it; it was our custom to ask the men to meet us in mass meeting and discuss these matters and make our propositions of what we believed we could pay for a certain time.

Q. When the company fixes the price it can pay, do you consider the individual as contracting, or as accepting the offer made?—A. I think the individual should, if he is going to agree to it for a definite time, be a party to it; if it is only going to be for the time being, and either party can change if they wish, I know of no reason why it should not be proper for the producer to say what he can pay, but if they are going to make an agreement for a year I think both parties should be heard and be parties to the agreement.

Q. (By Mr. RATCHFORD.) If this principle we speak of, the right of men to sell their labor for what they please, and to sell their product for what they please, belongs to each miner and operator alike, how is it possible to maintain those joint relations between the miners and operators of the different States?—A. I do not see that that would change it at all, whether an agreement is made by one man, or a number of men should delegate their authority to make an agreement.

Q. Explain how it would be possible for all the miners of Illinois to meet all the operators of Illinois.—A. I would not suggest anything of that kind. Supposing the miners would instruct their representatives to arrange for a certain wage scale, they would be parties, would they not?

Q. Is it not a fact that if such principles were exercised that it would be impossible for any representative to represent more than himself?—A. I do not know. I am not a member of any labor organization. I may be yet.

Q. In order to maintain joint relations between miners and operators, must there not be uniformity of action at all times?—A. That is true, but the point I made was that when they attempted to say that any man who did not belong to an organization should not work, it was wrong. I think it has been the experience that where less than a majority—very much less than a majority of the miners in a mine—have declared a strike, that all of the men in the mine have quit.

Q. How can such a small minority, which has been referred to, rule the majority?—A. They will hold a meeting and vote a strike, and the rest come out on a strike.

I do not believe in the boycott, nor the blacklist, nor picketing, nor patrolling of property when men are on a strike. I think they are all wrong, whether resorted to by employer or employee. I think a law prohibiting them would be a good thing.

I do not believe in the importation of foreign labor. I believe in a law that forbids the importation of foreign labor. I also believe that our immigration laws, as I understand them, are not properly constituted. I think the law that keeps out the pauper and the criminal is all right, and I believe that is attempted to be done by the present laws. It is all right as far as it goes, but I believe there should be an educational and property qualification before any more people are brought into the United States.

Q. (By Mr. CONGER.) Would you make that property qualification very high?—A. I would make it high enough to prevent the possibility of people coming in here who might become a charge on the State.

Q. (By Mr. KENNEDY.) Would that not practically close foreign immigration?—A. Very well; let it close.

Q. (By Mr. RATCHFORD.) Has any such foreign labor been imported to your State?—A. I do not know.

Q. Has your company imported any?—A. I have been there myself 10 years, and I assure you I never have. I do not know what was done before my time, but I have no reason to believe any were imported before my time.

Q. (By Mr. CONGER.) How about the importation of labor from one State to another?—A. I do not know of any way that can be stopped under the Constitution of the United States. As long as that is the case it is useless for me to express an opinion on it.

Q. (By Mr. PHILLIPS.) Have you imported colored labor, or large bodies of it, in case of strike?—A. No; I never have. I employ a white man or a colored man as he comes along, if I need him, and my superintendent, who does the employing, thinks he is the proper man to do the work. The only thing that we require is that a man, before being employed, must be able to understand the English language.

Q. (By Mr. CONGER.) You insist upon that?—A. I gave that order in 1894. I gave instructions to the superintendent who hires the men that, while we would

continue to employ the non-English speaking men then at work, men who could not understand the English language, that in the future—no difference what the requirements of the company were as to labor—under no circumstances whatever to employ a man who could not speak the English language sufficiently well to understand the orders that were given by the pit boss. That is a positive order. I will say this, that I think, while the superintendent has tried to carry it out, there have been men who got into the mines who could not speak the English language. We require a man to show a card showing he has been given work. They may have gotten in through some one who could speak the English language. I know of no other way in which they could have gotten in.

I know of no reason why, if a laboring man is violating the law, he should not be enjoined under the law the same as a capitalist is. It is a poor law that don't work both ways.

Q. (By Mr. KENNEDY.) Do you think they should be enjoined from committing a wrong somebody else thinks they will commit which they have not made any start toward committing?—A. In the same way as if you thought I was going to take some of your property or encroach on your land. You would enjoin me from moving your fence if you thought I was going to do it. I think the same laws which govern capital in that respect should govern labor. I do not see any reason why it should not.

Q. (By Mr. C. J. HARRIS.) Is there not a mistaken idea on the part of labor as to what an injunction is?—A. Yes; I am inclined to think that a good many laboring men look upon an injunction in an altogether different light from what it is intended to be—from what it means.

Sliding wage scales in mining are not, as a general proposition, practical. They have been adopted in some localities for some particular reasons; for instance, some works being supplied by a mine which the people who own the works open and operate for their own purposes. I understand that in such cases they have at times agreed to pay the miner according to the selling price of the product.

Q. How does that work?—A. I should think it would work to the advantage of the people who were manufacturing the iron, if they were manufacturing iron.

Q. I understood you to say it had been used in the coal business?—A. I said, I think, it is known where a man owning a mill has a coal mine has made such an arrangement, and, unless I am very much mistaken, in the hard-coal regions—I do not want to be understood as giving this as a fact, I am not quite positive about it—but I am under the impression that in the hard-coal regions they have some kind of a sliding scale, but I do not know what it was based on.

Q. Does it cut down to the living wage when times are hard?—A. The man who earns the wage, I think, is the best man to judge as to what is a fair wage to him. I think I prefer to judge as to what is a fair wage for me.

Q. Is there a good deal of variation as to what the living wage is?—A. I guess there is. I believe that a producer of coal can earn more money when he pays a high wage than he can when he pays a low wage, and that if wages for mining coal were uniformly higher throughout the United States, profits would be better.

Q. (By Representative GARDNER.) Why would that be true?—A. My experience, which, of course, is not as extensive as that of some others has been, is that when we pay the highest prices for mining we earn the best profits.

Q. Did you or did you not at that time pay the high prices for mining because the demand was exceptionally good?—A. I presume that is true.

Q. Then were your profits due to the high wage or the exceptionally good demand?—A. If the demand had not been exceptionally good we could not have paid the high wage, and that proves what I said—that when we paid a high wage we made the best profits.

Q. You don't mean to say that if you paid a high wage all the time the general result would follow?—A. No; trade conditions will control prices in spite of anything you can do.

Q. Would it or would it not follow that if by general agreement the wage was raised all over the country that prices would rise too; so that if it resulted in no profit to the miners it would result in no loss?—A. In good times it would; in bad times, I rather doubt it.

Q. (By Mr. CONGER.) What wages do you pay your miners now?—A. Sixty-three cents for run-of-mine coal.

Q. What is the average product of each miner per day; how many tons can he mine?—A. I do not like to answer that question, because there are so many men who are not practical miners. Let me give you an answer in this way: At one time we made a careful estimate of the number of men working in one particular mine—good, bad, and indifferent. We estimated that there would be at all times 10 per cent of those men out of the mines, either sick or on account of a fall, or

for some other reason, and that we should get an average of $2\frac{1}{2}$ tons of clean lump coal from the men. We were getting that—good men and bad men. The present basis is about 14 per cent less. At present run-of-mine coal would run something over 3 tons per man, about $14\frac{1}{4}$ to $15\frac{1}{4}$ per cent screenings; so you would have to add that.

Q. (By Representative GARDNER.) How do miners' wages compare with 10 years ago?—A. They are not as good as 10 years ago. Nine years ago, in northern Illinois, we paid $82\frac{1}{2}$ cents in the summer and 90 cents in the winter for mining coal.

Q. Was that run-of-mine or screened?—A. Screened lump coal. That was $86\frac{1}{2}$ cents average for the year.

Q. (By Mr. PHILLIPS.) Why did you pay more in the winter than the summer?—A. There was a better demand for coal. There was no particular reason for it, except we agreed to it.

Q. (By Representative GARDNER.) At the same time I understood you to say that the profits of the manufacturer were less than they were?—A. You did not ask me that question.

Q. You said for the last 10 years you thought they were less than an investment in a good security?—A. I did.

Q. Then competition has brought the profits and wages down together?—A. Yes; profits are down with the wages.

Q. (By Mr. A. L. HARRIS.) What effect does competition have on the price of coal in the markets?—A. My experience is that competition in coal generally is the sharpest competition there is, and that people will sell coal when occasion requires, in competition with each other, at less profits than almost any other commodity.

Q. What effect has that small profit caused by competition have on the pay of the miner if there should be no contract with the miners' organization?—A. I do not know.

Q. Would it have this effect, that the competition would cause the operator to take low contracts and then go back to the miner and ask him to reduce his pay because the margins were so close he could not sell his coal for a higher price?—A. I would not be surprised if it did in many localities.

Q. If all operators have an annual contract throughout the entire country with the miners, would or would not the operators be disposed to cut under each other when they knew the loss was going to come on the operator?—A. They would cut prices just the same, but I do not think they would cut to the extent they would if they thought they could coerce their workmen into accepting less wages.

Q. Has or has not this close competition been the cause largely in the reduction of the wage of the miner?—A. No, I think not. I think the competition was just as sharp 8 or 9 years ago as it is to-day. I say "to-day," while trade conditions are better for the moment than they have been for a number of years, and of course competition is not quite so strong when trade conditions are so good.

Q. (By Representative GARDNER.) Is there much difference in the consumption of soft coal at different parts of the year?—A. Yes; more soft coal is consumed in the winter than in the summer, although it does not follow that there is more mined in the winter than in the summer. I think the people in the Ohio and Pennsylvania districts mine more in the summer, because they ship it by lake, while we who ship it by rail mine it as we need it.

Q. Is it not most always true of the retail market that coal is half a dollar cheaper in summer than winter?—A. I know nothing of the retail market.

Q. (By Mr. FARQUHAR.) Will you answer whether the prices of coal are or are not regulated by competition and not by combination?—A. Regulated by competition. In certain localities they may regulate the price by agreement, but the general price is regulated by competition.

Q. (By Representative GARDNER.) Could or could not the price be as well regulated by a number of individual operators signing an agreement as it could by the formation of a trust, so-called?—A. Locally?

Q. Yes.—A. Combinations could; yes.

Q. What reasons are there why organizations and agreements could not regulate prices as well as trusts, in all cases?—A. We have tried a little experiment in agreeing among ourselves at times as to what we would sell coal for, and we found that a reasonable price could be obtained temporarily, but as soon as there was a slacking in the demand some fellow quietly slipped out and, in order to get advantage, cut the price, and demoralization was the result.

Q. Is the reason why operators can not combine to regulate prices as well as a trust can regulate them because of the inherent dishonesty of the men—they will not keep an agreement?—A. I do not know any other reason. With reference to

colored labor, I know of no reason why a colored man, being a citizen of the United States, should not be entitled to every consideration as a workman that is accorded to his white brother, whether he is a citizen or not.

Q. (By Mr. PHILLIPS.) In your State are there many colored laborers employed in the mining industry?—A. There are some in different sections of the State. I should say, as a rough guess, that we have 50 colored employees out of perhaps 1,600 or 1,800. We hire them as they come and go, just as any other class of people.

Q. They work with the other miners, side by side?—A. Yes.

Q. What per cent, would you think, of the total in the State is colored labor?—A. I have no means of knowing that.

Q. Are there any mines wholly worked by colored miners?—A. I do not know of any in Illinois. I am very much in favor of public libraries and reading rooms. I think they are a good thing and should be encouraged.

Q. (By Mr. CONGER.) How many hours a day do your men work now?—A. Our under-ground labor works 8 hours, and the majority of the outside labor—blacksmiths, carpenters, etc.—work 10 hours. They do, generally, I think. It is necessary to do certain work after the mines have closed for the day in order to have it ready for the next day. Miners' tools must be sharpened and repairs are to be made.

Q. (By Mr. RATCHFORD.) You stated, I believe, that there were a great number of your miners who were not experienced men, practical men?—A. They were not raised in the business.

Q. Do you think that has a tendency to reduce the standard of wages?—A. I do not think so. It has a tendency to reduce the earning capacity of the average man. It reduces the average for the total number of men mining.

Q. Does it require a greater length of time for a miner to be experienced in mining your coal vein than other veins?—A. I do not believe it does. They do not use any explosives at all. Still, I find this—that the men who have been raised in long wall work do better work than men who have been in room and pillar work, raised in it, and are called good miners in that work; that the men raised in long wall work will make a better tonnage than those who have not.

Q. Is that not also true of the man who has been raised in the room and pillar work?—A. Yes; I think that is true. I have had but a limited experience in the actual mining of coal on the room and pillar system. For a great many years that I was in the coal business I did not have anything to do with the mines. I simply took care of the selling of the coal, shipping, and transportation, and did not come in contact with the other.

Q. Could you state whether or not the mining in your field will require a month or 6 months' or a year's longer experience to learn the peculiar nature of that mining than elsewhere?—A. I can not. I have not had the experience in the other work.

Q. You have claimed, however, that the low standard of workmanship stands in the way of giving a fair average as to the wages of all?—A. That is true.

Q. The testimony has been given before this commission at a previous time that a coal miner is made in 2 or 3 weeks' experience.—A. That might be true in room and pillar work; I do not know.

Q. If that is true in room and pillar work, you are not able to state whether it requires a greater or less experience in your vein. How, then, does that affect the standard of wages?—A. I do not know whether it is true in room and pillar work.

STATE OF ILLINOIS, *County of Bureau* :

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

S. M. DALZELL.

Sworn and subscribed before me this 21st day of August, 1899.

CHAS. W. KNAPP,
Notary Public.

WASHINGTON, D. C., April 14, 1899.

TESTIMONY OF MR. THOMAS W. DAVIS,

Vice-President of the United Mine Workers of America.

The commission met at 10.30 a. m., Vice-Chairman Phillips presiding. Mr. Thomas W. Davis, of Indianapolis, Ind., appeared at 4.20 p. m. and testified. The topical plan of inquiry on mining was followed.

Q. (By Mr. C. J. HARRIS.) What is your official position?—A. Vice-president of the United Mine Workers of America.

Q. What was your original field of work in the mining business? What district are you most familiar with?—A. I am pretty familiar with the mining conditions of what is known as the central competitive district, as well, possibly, as the anthracite district of Pennsylvania.

Q. Where were you before you became an officer of this organization?—A. Before I became an officer of the United Mine Workers of America and previous organizations of which I have been an officer, I was a miner in the anthracite region of Pennsylvania.

Q. What have you to say regarding the constitutions of trade unions, their general tenor and import?—A. I desire to confine myself to the miners' organizations, and possibly at this time to the United Mine Workers of America, unless in the way of general information there may be some reason to mention past connections with other organizations. I presume that the constitution of our organization has been handed to the commission. I think you have; that and the regulations of the trade are embodied practically in the agreements that exist, and which have been recently reaffirmed in the Pittsburg convention, and I presume the commission is also in possession of that document; if not, it can be very readily put in the possession of the commission.

Q. In regard to the growth of your trade union, we have had testimony from your officers; so you could just speak generally on that point, if you wish.—A. In a general way, I think that our organization dates with practically the balance of them, along toward the year 1868. Especially is that true of the anthracite miners. There were, I believe, organizations at times previous to that, but it was in 1868 when the anthracite miners established what is known as the Workingmen's Benevolent Association, which for 5 or 6 or 7 years exerted considerable influence among what is known as the lower and central anthracite miners. After that, along, I think, in 1869, an attempt was made to establish a national organization. It was more or less successful in the States of Illinois, Indiana, Ohio, and the Pittsburg district of western Pennsylvania. That for a time flourished, had a considerable membership, but eventually passed out of existence. That was succeeded by another effort which practically followed the same lines and practically covered the same territory, possibly not as extensively as the first one. Then there was another attempt in 1883, or 1884, I think, to form what was called the American Federation of Miners. That was not more extensive in its jurisdiction than the previous organizations. In 1886 preliminary steps were made under the Knights of Labor to establish a national district of miners. That was more or less successful in Alabama, and portions of Tennessee, some portions of Kentucky, as far west, I think, as Wyoming, including possibly the States of Ohio, Indiana, Illinois, Missouri, and Kansas, with a scattered membership through the entire State of Pennsylvania, or at least through the mining regions of Pennsylvania. In 1889, I think it was, we attempted to form from the old American Federation of Miners and National Trade Assembly 135, the rival miners' organization at that time, a national organization called the National Progressive Union, and that met with more or less success, but in—possibly I am getting my dates a little wrong—in 1889 or 1890, the present organization was formed by the unification of National Trades Assembly 135, Knights of Labor, and the National Progressive Union. That is the basis of the present national organization of miners.

Q. Is there any national organization that has a larger membership than you have now?—A. No, there has been no national organization. While perhaps the membership was more scattered, I do not know whether our membership is as extensive at this time as to States as it has been under the National District, but our organization in membership is much stronger at the present time than were both organizations previous to the present one.

Q. Are you in favor of the incorporation of the trade unions?—A. I have not given that question as much consideration as I would like to. In fact, organiza-

tions have for some years, among the miners, been rather an unsettled quantity, and my efforts have been directed to building up the organization among the miners. I have not thought so much about the legal phases: I have not thought so much of legislation unless we ran up against some adverse legislation—something that had been enacted that prevented us from bringing around a certain condition or a certain end—and I have not, as I said before, paid possibly as much attention to the question of legislative enactment as a great many of my colleagues have. I have believed more in the effort of the trade-unionists to regulate their own affairs than I have in the question of legislation. As an abstract proposition, perhaps, I can not see why they should not be incorporated.

Q. Can you see any special benefits that would arise?—A. Possibly there would be some advantages by giving them a legal standing.

Q. What are your relations as a trade union to nonunion labor, and the right of liberty of contract?—A. While I do not know that you might call it antagonistic exactly, yet it is well known that all the labor organizations use their influence to organize all unorganized people in their trade or calling. I know we do it. We employ a force of organizers for the purpose of disseminating the principles of our organization—its aims and its objects—among the unorganized miners of the country.

Q. Will you go so far as to advise organized members refusing to work with unorganized laborers?—A. Not exactly; not along that line exactly. We go so far, of course, as to use every argument we can possibly use to advance the cause of organization. We try by every fair means at least to have all nonunion men join the organization. In times of strike we use every means within our power legitimately to induce nonunion men to become union men.

I do not understand what is meant by the liberty of contract in your question.

Q. (By Mr. FARQUHAR.) Do you surrender any of your liberties when you join a trade union?—A. No; I do not understand it so; but this is the reason why I asked this question as to the liberty of contract: I do not know how it is with others, but I know in the coal-mining business we are frequently asked to sign a contract for certain things. In this contract the conditions have been prescribed by the employer. I believe that such a contract is now in existence in what is known as the William P. De Armit mines in Pennsylvania, and other contracts have been published from time to time in the United Mine Workers' Journal from employers in Iowa and, I believe, in other sections of the country. I have never regarded such as a fair contract at all, because of the conditions surrounding it. For instance, employment was made conditional upon the applicant for employment signing this contract. His alternative was refusal to be employed. Possibly his circumstances are of such a character that he must have employment at once. Rather than have no employment, taking his chances of getting on farther and seeking employment, he signs the contract. He has not been a party to the provisions of the contract, has been unable to stipulate any of the conditions it has, but as a choice between tramping in search of employment and signing that contract, he signs it. We consider that an unfair contract. Our organization so regards it.

Q. (By Mr. KENNEDY.) Did you go into the miners' union with the idea that you should make or have made for you a more advantageous contract than you could make as an individual miner?—A. Yes.

Q. There is no doubt in your mind but what you have succeeded in that respect?—A. That is right.

Q. Are you at perfect liberty at any time to walk out of that miners' union and work for an operator who would offer you 10 cents or 5 cents a bushel or a ton less than you work for as a member of the miners' union?—A. Yes.

Q. So it seems your liberty is in no way curtailed?—A. No way curtailed.

Q. Is your trade union ever ordered not to work where nonunion laborers are employed?—A. Not that I know of; nothing in our constitution to that effect.

Q. Is it a practice that ever obtains anywhere, in your experience?—A. As I said before, if there are nonunion men in the mines, the union men will do all in their power to unionize them. I have not seen that power fail where the majority of them are union men.

Q. In case they can not persuade them otherwise do they resort to this or not?—A. I have not known of such a case as that. Perhaps there is one explanation for that, now, that will clear up that ground more or less. Our contract stipulates that certain provisions shall be observed between the operators and the miners. Sometimes a check-weigh fund covers the business, and every man working in that mine is supposed to contribute a certain portion of his earnings for organization purposes. That unionizes every man in the mine, and it is the same with the trouble you are trying to get at.

Q. Unskilled labor, organized and unorganized; have you anything to say on that?—A. No, unless I say, as a general proposition, we try to organize skilled and unskilled labor in our trade; but I do not suppose coal mining is classed as skilled labor, though it will take as much skill to perform it in a proper way as it does any other labor.

Q. What, in your experience, are the several causes leading up to strikes?—A. My experience has been that strikes are either defensive ones against reductions or what the operators term an offensive, aggressive strike for an increase of wages and better conditions of employment. These three heads, I believe, cover in a large measure the causes leading up to general strikes. There are, perhaps, other questions in a local way that cause the local strikes, such as screens, and whether the mine is properly ventilated, and so on—many little questions of difference that arise between individual operators and their miners, which cause more or less friction between them, and result in a strike; but I do not regard them as general.

Q. (By Representative GARDNER.) What have you to say of the general results of strikes in your experience? Are they beneficial to the workers, the consumers, and the operators?—A. The strike question appears to be a large one. If you would take the history of the strike of 1897, you would find a general average of a loss of 78 days' work. Considered from that standpoint it would be considered an economic loss. But when you consider it from the competitive standpoint, then it is not such a serious loss for this reason: Take the figures in the four competing States known among the miners as the central competing district, and we find that the loss of time has only been anywhere from 1 to 13 days as compared with the year 1896, when there was no strike. Now that is the position. Take, for instance, the State of Ohio, and I think that our mine inspector's report gives the working days, in 1896, 156—I may not be quoting the exact figures, because I am quoting from memory and have not the figures exactly at my hand—and, in 1897, 144 working days in the year. The difference, then, between 144 and 156 is only 12 days, and there can be only 12 days' loss ascribed to the strike; yet our strike was 72 or 78 days in that State. Indiana, on the other hand, increased its working days in 1897, as compared with 1896, 1 working-day; yet Indiana, in the block coal field, was 72 days idle, and in the bituminous field they were 72 days idle. And as to Illinois, I think 184 were the working-days in 1896, and 185 in 1897, but this should be taken into account as regards 1896 and 1897 in Illinois: The statistical year in Illinois, as I understand it, ends some time about the 30th of June. Our strike in 1897 was not declared until the 4th day of July, 1897, and it will take the statistics of 1898 to arrive at a comparative understanding of the conditions in Illinois between 1897 and 1898, in order to get at the proper strike statistics. As the statistics are at present compiled, Illinois shows an increased tonnage for the year 1897—that is, the statistical year—over 1896, and yet the former was the year we had the strike. Now, judging from that standpoint, neither miners nor operators lost very much money by reason of the strike. There was simply a change of time of shipment. Here is a fact that perhaps is overlooked in mining statistics: In the year 1897 we produced 200,221,765 tons; the average time worked was 174 days. If we can produce that tonnage in 174 days, and if we were working every working-day in the year—dropping the 52 Sundays out and the 7 legal holidays would give us 306 working-days; basing, then, the possible production on the actual time worked, we can produce in these United States about 370,000,000 tons, and we have never yet found a market for more than 212,000,000 tons, which is the aggregate production of 1898, while in 1897, as I said before, it was 200,221,675 tons in the aggregate.

Q. (By Mr. PHILLIPS.) That is bituminous coal?—A. No; that is the whole of it. Now, coming to the anthracite, it shows up this way, the anthracite in 1897 only worked 150 days. They produced in that 150 days a little over 52,000,000 tons of coal. Less than one-half of the working-days of that section of the country were worked, and they produced a little over 52,000,000 tons in that time. It is very evident that they could produce a tonnage equal to about 100,000,000 or 110,000,000 tons. That is the position of the anthracite coal trade.

Q. (By Representative GARDNER.) Are you acquainted with the manner in which statistics of loss by strikes are generally made up by the various bureaus of the States or the National Government?—A. Yes; I know what they claim to be the systems.

Q. Is it true that, as a rule, the statistician, in estimating loss by strikes, takes the time that the works were idle in consequence and computes the wages of the men for that period, together with the loss to capital for idleness in that time and adds the two together and states that as the loss caused by the strike?—A. Yes; that is the way of it.

Q. And under the view which you have been giving as to the coal mining, it is

true, is it not, that that method of computation as to the results on the laborer is entirely inaccurate?—A. Yes.

Q. That those idle days are replaced by days of labor that would otherwise be idle days?—A. Yes. Let me say something a little further now. It is my business as a national officer to become acquainted with the facts of the coal mining business not only in the anthracite but every place where there is mining done, though I am sorry to say I can not reach that degree of perfection in connection with these things that I would like to reach. I am only doing the best I can. I am a student of the conditions of the mining craft, however.

Q. (By Mr. PHILLIPS.) Has your experience been chiefly in the bituminous or anthracite?—A. The last 12 years in the bituminous. I was born and raised in the anthracite and bear the marks upon my person of that coal; consequently I know something about it. As man and boy, I have worked up there for 16 years, and I have mined coal from Missouri to northeastern Pennsylvania.

Q. (By Mr. FARQUHAR.) You were just making a statement in respect to this loss of wages?—A. I think that Commissioner Gardner's definition of the way the statisticians get at it is correct, and I do not think that it is the proper solution. I think it is simply, in our business, transferring the working time from one time to another, and the shipment from one season to another. I have tried to make that plain, because those strike statistics come up very frequently to the front as great economic losses; and they would be if it was a question of steady employment, but it is not. The miners have not averaged more than 204 days from 1890 to 1893; these 4 years from 1894 down to 1897, the time has been about 100. I do not know whether it is 78 or 87. I can not remember really what are the figures, the average working time for the miner.

(By Representative GARDNER.) Did the same result reach the operator as the miner in that respect; did he make good the time lost by the strike in shipping before the year was out just as much coal as he would have shipped if there had been no strike at all?—A. Yes; I think that that is true, generally speaking. The year 1898, just closed, is the greatest in the history of this country in coal production. The next greatest is the year 1897; the total of 1897 was greater than in any year in our history previous to that, and yet we had the greatest strike in our history among coal miners in that year.

Q. Do you know whether or not it might not be very injurious to the operator by loss of trade, owing to his inability to fulfill his contracts; that is, the forfeiture of contracts in consequence of the strike and inability to get the coal at the proper time?—A. That is a feature of the business that of course I am not in a position to judge of so as to answer positively. I have an idea that there may be embarrassments caused to operators by reason of that fact. If the commission had time, I would like to illustrate something in connection with the transferring of our tonnage from what I regard as its natural market under ordinary conditions to another market under the extraordinary conditions of a strike.

Q. You mean a different market, or the same market at a different period?—A. A different market. I will use the strike of 1897 as my illustration. The central region of Pennsylvania ordinarily ships to the city of Buffalo, N. Y., and it is transported, I suppose, to the markets of the Northwest. In 3 weeks after our strike was inaugurated, the papers proclaimed the fact that the cities of Chicago, St. Louis, Cleveland, and other cities were fast becoming depleted of their coal stocks and that unless relief came from some place the industries would have to close down. In 5 weeks after that, the coal papers devoted to the coal trade said that the situation was less alarming and that the famine was not so stringent, etc. The miners expected success upon their ability to create a coal famine. That was their hope of success. At that time it was a subject of inquiry with me from where the stringency had been relieved in 5 weeks, when it was so acute in 3 weeks, and I found that a shipment that under ordinary conditions was going to Buffalo and there transported to the Northwest, was being diverted down to relieve the stringency along the lake ports and to Cleveland, etc. The same condition was true of St. Louis, where they diverted the shipments from Missouri and from Kansas and Iowa down in that direction to relieve the stringency there. West Virginia and Kentucky coal came in and relieved the stringency in Chicago. This was the condition, and consequently after 5 or 6 weeks of strike there was less stringency in the markets that properly belonged to the central competitive district than there was in 3 weeks, and it was due to that fact I have tried to point out to you—the possibility of production in this country as compared with its consumptive needs.

(The commission adjourned until Saturday, April 15, 1899, at 10 o'clock, at which time the commission again met and continued the examination of Mr. T. W. Davis.)

As to the boycott, so far as we are concerned we have only had, to my knowledge, one boycott in the coal business. Its results have been, in my estimation, rather indefinite. There seems to be a great deal of trouble to establish an effective boycott on nonunion coal. The points of distribution are so far removed from the scene of production and the inability, possibly, to follow the production around and establish an effective boycott has rather made it, in our estimation, a questionable proceeding. Possibly a considerable tonnage may have been diverted from its usual market or from the market, possibly, that it could have obtained, were it not that there was a boycott on that coal by the organization.

Q. You found the boycott ineffective, did you?—A. Possibly our efforts were not continued sufficiently long along those lines to establish its efficiency or inefficiency. That is about all I have to say on the boycott.

Q. What do you think of the principle of the boycott?—A. I think that the boycott is a severe weapon, myself, and should be used only in extreme cases and where every other method has failed. I justify it when every other reasonable method has failed to secure audience and redress from employers.

Q. (By Mr. KENNEDY.) In view of the fact that the courts have invariably held that the boycott, when put in operation, was a conspiracy against those whom it was intended to affect, and the fact that the courts will undoubtedly follow precedents set already, do you think it is advisable for labor unions to countenance the boycott at all?—A. I do not think it advisable for labor unions to defy the law; I do not think they can afford to do it; but if there is such a way of constructing a boycott so as to keep within the law, then in such extreme cases, where every reasonable method is refused, I would be in favor of it; but if it is a question between violation of law or the endurance of a wrong until the law can be remedied, I would rather endure the wrong than violate the law.

Q. (By Mr. FARQUHAR.) You mean by that that to have a boycott within the terms of the law would be directly ineffective?—A. Well, possibly, as the law is constructed at present; but it would be effective if it were possible to construct a law that would allow a boycott. I do not know whether that is a possibility or not. I am not up on this legally.

Q. (By Mr. C. J. HARRIS.) Do you find blacklisting is prevalent at all?—A. I have had no personal knowledge of or experience with that. It has been told to me, however, that miners are compelled frequently to move from one community to another by reason of being blacklisted for what is known in general parlance as their unionism. I think that is frequently charged against operators of West Virginia in particular; and down in the Indian Nation, at present, our organization has a strike; the original cause of that is the refusal of employers to allow union miners to work in their mines. There may be other causes, but that is the principal and, as I said, the original.

Q. What can you say of the boycott, picketing, or patrolling, and other methods of influencing results?—A. When my organization is on a strike, it uses all the means it can to influence results. We think that our ability to shut off the supply of coal entirely is the successful method.

Q. (By Representative GARDNER.) Then you do picket?—A. Yes; send out men to influence others.

Q. (By Mr. C. J. HARRIS.) What are your methods? Just describe them.—A. I think it is facts you want. I have never done, personally, any picketing. I understand that picketing is where men attempting to work are reasoned with and influenced not to do that, because it is an injury to their fellow-miners.

Q. What methods of persuasion do you use?—A. Language.

Q. Abusive or conciliatory?—A. Conciliatory.

Q. When conciliation does not work do you resort to abuse?—A. I do not think they do; there might be extreme cases of that kind.

Q. Is it not apt to run into violence, from your experience?—A. Not in a general sense. There may be some cases of violence where passions become aroused and possibly supersede reason.

Q. In your anxiety for success is it not your candid opinion that sometimes a thing goes too far?—A. Possibly there may be cases where we may exceed what would be called good judgment.

Q. (By Mr. KENNEDY.) You have not said just what picketing means. Do you mean you send committees to meet incoming miners and talk with them before they have a chance to go to the mines, and also meet those who have already been at the mines?—A. That is my understanding of picketing.

Q. And patrolling is turning out on the highway to show your strength and make demonstrations?—A. Possibly.

Q. (By Mr. PHILLIPS.) To place men out around the works?—A. I should say our organization has no constitutional provisions nor rules nor regulations cover-

ing that matter. It is simply a question of legal expediency. Take the case of Virden, for instance. Our miners were to meet these people that came in and try to influence them to return to their homes again. That, in that sense, is picketing and patrolling.

Q. (By Mr. FARQUHAR.) Did not your organization in Illinois take these miners who intended to take the places of the Illinois miners to Springfield, and talk with them there and advise them to go home?—A. Yes; they chartered a train and sent them back—those that were willing to go; sent them back to Birmingham, Ala. After they kept them a day or two in the room there at Springfield they chartered a train and returned 50 or 60 people at the expense of the miners.

Q. (By Mr. C. J. HARRIS.) The rest that would not go home—what methods or means did you use with them?—A. I do not know what we did with them.

Q. Were you there?—A. No.

Q. There was violence somewhere?—A. Not with them.

Q. What have you to say about sympathetic strikes; do you think they are advisable?—A. It would depend upon conditions. On the general proposition, possibly it would be questionable whether sympathetic strikes are advisable or not; under certain conditions they may be.

Q. Would it not have the effect of arousing public sentiment against labor unions for men who are well treated, having no complaints, to throw the public into confusion with a strike, simply because somebody else is striking and in trouble?—A. That would depend, it appears to me, upon the public's knowledge of conditions leading up to the strike. Take our great strike of 1897, when the slogan was "A living wage for a fair day's work." The public outside the labor organizations were largely in sympathy with the object of that strike. The condition of the miners had become so poor, the wages had been reduced to such a low amount, that it was almost impossible for the miner to obtain for himself and family the necessities of life. These conditions the American people were made aware of. Statistics were produced showing the amount of earnings, etc., that the miners received for their labor, and public opinion favorable to the miners was created, and everybody insisted that the miner should be paid a fair day's pay for his labor. In some communities the citizens got together and passed resolutions that they were in favor, if it was necessary, and if the miners could obtain it, of an advanced price on the selling price of coal, in order that the miners might obtain for their labor a living wage, and so on.

Q. (By Mr. FARQUHAR.) In what district did this strike first start?—A. The strike order probably affected four States—three States and the western district of Pennsylvania, what is known as the Pittsburgh district. And in talking of Pennsylvania in connection with our strike we will bear in mind that I always refer to what is known as the Pittsburgh district, and not to the State at large; practically the counties of Allegheny and Washington, in that State.

Q. (By Mr. KENNEDY.) You believe, I suppose, as most workmen, in the old motto, "The injury of one is the concern of all, and the interest of one is the interest of all," in organization of labor?—A. In a general way, yes; I do believe that. I do not think it would be a good policy to injure all, however, for the one.

Q. If the most of the unions in the American Federation of Labor and the railroad unions were to go on a strike on a certain day for the 8-hour workday, for instance, do you believe miners would be apt to go on a sympathetic strike with them if they were asked to?—A. I do not think that would be a question of legislation. If the American Federation of Labor had determined upon it, and it would be legislated by that body, we, being affiliated with it, in case we were not working 8 hours a day, would feel obliged, of course, to observe its enactments in that direction. I presume that would be true of the affiliated organizations of that body. It would be a practical legislation of the convention that would determine upon that, I presume.

Q. You have the 8-hour workday?—A. Yes. Possibly in that condition it would be foolishness for us to strike for something we were enjoying.

Q. Supposing the railroad wanted the coal to carry on their business, you would be furnishing the weapons to the enemy; they would perhaps, under circumstances of that kind, ask you to strike in sympathy with them. That is my idea of a sympathetic strike.—A. I do not know what we might do in a case of that kind. That would be a matter for the legislation of our convention.

Q. (By Mr. C. J. HARRIS.) Is it your idea that that would be a reasonable mode of procedure? What might be proper in the coal mining 8-hour day might not be so reasonable in other lines of labor.—A. Possibly that might be so, but I think 8 hours of labor reasonable in our class of labor. There are probably additional reasons why miners should obtain it over a great many other workmen, by reason

of the greater amount of work, or rather the disadvantages of their occupation, as compared with a great many other occupations.

Q. (By Mr. PHILLIPS.) What are those disadvantages?—A. Possibly their working places, impurities of the air they are frequently compelled to breathe, and the great physical strain caused by reason of the hardships of the work.

Q. Does being shut out of the sunlight have any effect on their situation?—A. Naturally would. Sunlight and pure air are conducive to health.

Q. Do you observe from your experience as a miner that ill effects result from the causes that you name—lack of sunlight and impurities of air?—A. I have observed among miners in the anthracite region of Pennsylvania there are diseases such as miners' asthma. Hundreds of miners become afflicted with it at a very early age, some of them as young as 30 years, and possibly younger than that; others, men of strong constitutions, endure mining for a longer period of time.

Q. What effect does that disease have upon the constitution; is it similar to the ordinary asthma?—A. Similar disease; for instance, the difficulties of breathing are similar. It has been known to result very similarly to tuberculosis or consumption. Some men endure it for a number of years; others pass away very rapidly with it.

Q. It really proves fatal, does it, in a great many cases?—A. Yes. It is a very prevalent disease up in that section, and was more so among the older classes of miners than with the present class, for the reason that the mine-inspection laws have resulted in an improvement in the ventilating systems of the mines.

Q. Is there any disease peculiar to the mining of bituminous coal?—A. No; except, perhaps, the same disease, but not in as acute and as extensive form. There is more or less disease in the mining of coal in both the anthracite and bituminous regions, but in the bituminous regions my experience is that miners are not as readily used up and exhausted physically as in the anthracite.

Q. What is the effect on the eyesight, being shut out from the sunlight, if any?—A. I do not know. I am not sufficiently posted on that. I have not paid any attention to that phase of it.

Q. Do you find they are affected especially by the use of artificial light?—A. The miners who have been working with the safety lamp claim it injures their eyes. I have not had a great deal of experience with the safety lamp; in fact, I have never used a safety lamp other than to test my working place. I never worked by the safety lamp alone. All miners claim, where they have been for years using the safety lamp, that it does affect their eyes injuriously.

Q. The chief effect you think is upon the lungs in both instances?—A. Yes.

Q. (By Representative GARDNER.) Do you know any statistics from which these facts could be gathered?—A. No; I do not know particularly, and yet it appears to me that the Medical Review, possibly the year 1894, had an article along these lines, as to the injurious effects upon the health of the miners—continuous occupation of the mines.

Q. (By Mr. FARQUHAR.) What is the average of the working years of the miner?—A. I am unable to answer.

Q. If a boy goes into the mine at 16, how long, ordinarily, will he stand mining continuously?—A. I do not know; perhaps I would better give you my own experience. I went in as a boy of 8½ years, and I worked in the mines, I think, about 25 or 26 years, and I was beginning to feel the effects on my breathing apparatus very much. I have known, however, other boys who possibly went in the mines as young as I, and they are still there, and are physically, so far as I am able to judge, all right. There are others I have known as boys, who started in with me, who are now dead as a result of the disease that I have mentioned. I presume in that, possibly, as in other businesses, it is largely a question of constitution.

Q. What proportion of old men are there in the mines as miners?—A. I do not know.

Q. (By Mr. C. J. HARRIS.) In regard to importation of foreign labor, is there much of that now?—A. No; I do not think there is. I am not in favor of any of it.

Q. Is there not a possibility that as much injury can be done by importation of labor from one State to another as by the importation of labor from foreign countries?—A. My supposition of the immigration law is this: That it was built for the purpose of protecting our home labor as against foreign labor. We have, as laboring men, considered that a reasonable proposition. Is there not a probability that it is just as reasonable to protect our citizens against other citizens? I am only asking this myself as a question that perhaps somebody will be able to define to my satisfaction at some time. As to free coming together of our own citizens

between the States, I think it is right and proper; but here, as it was in the case of Illinois, our laws prevented those people from going across the water or to any other foreign country and contracting for labor to come here, yet they could go to Alabama and contract for labor of that State to come to Illinois. That was not free intercourse between American citizens; it was a contract intercourse, and it had the same result or effect exactly as if the labor had been contracted for in a foreign country. The question in my mind is whether, if we have a right to prohibit the importation of contract labor from other countries, we have not the same right to prohibit contract labor between the States? My own opinion is that certainly the intercourse between the States has the right to be governed in a general way. We do not prohibit people coming to this country who are coming here seeking employment in the ordinary way, of their own volition. Our national laws do not do that, but our national laws say that they shall not be contracted for to come here. It is a question of liberty, which I look at in this way: If a man comes from Alabama and goes to Pennsylvania or down to Illinois of his own volition to secure work there, all well and good; but if to defeat certain parties, or to bring around a certain condition, the employers there, through agents or directly, go to Pennsylvania or to Alabama and by reason of misrepresentation, etc., contract with these people to come down, I think that they should be prohibited.

Q. (By Representative GARDNER.) Leaving the legal question out, you advocate, if possible, the passage of an anticontract interstate law?—A. Yes.

Q. (By Mr. PHILLIPS.) Whether individually or collectively?—A. Individually or collectively, if it is a contract.

Q. (By Mr. C. J. HARRIS.) What has been your experience with conciliation, mediation, and arbitration?—A. My experience with these methods has been confined exclusively to my connection with my organization. The constitution of the organization provides three methods for adjusting difficulties—conciliation, arbitration, and strikes. We offer to conciliate the conditions that may arise between our employers and us. We think it a reasonable, humane, and proper method of doing business. In case we can not conciliate, our next movement is to arbitrate, and, where both of them are refused or are failures, we think we are justified in strikes.

Q. Do you find employers as a general thing ready to discuss matters with you?—A. As a general thing, especially when the joint-movement methods are in vogue, yes; aside from such seasons as that, no. Usually, when there is a way to put it, they want to prescribe conditions of employment and all the other conditions and provisions about the mine, prices, etc.

Q. Do you bring in State boards of arbitration to any extent, or do you rely upon boards of arbitration picked out by yourselves?—A. We adopt both methods. My own preference is for boards selected by ourselves.

Q. Are you in favor of compulsory arbitration?—A. Under certain conditions, yes. I think that where the trouble involves a large number of people, outside of the people directly interested, that there should be some way of compelling parties to submit that difference to arbitration; and, as a point in view, let me give one illustration: Some time ago, during the great strike of the American Railway Union and the Pullman people, Mr. Pullman said emphatically that there was nothing to arbitrate. His opposition involved a great many people. The position of the Railway Union was that they were ready to arbitrate, wanted to arbitrate. I think if there had been at that time some way of reaching Mr. Pullman and compelling arbitration, that it would have been a public benefit. I have not paid enough attention to the question of compulsory arbitration to recite instance after instance where possibly such conditions would be favorable, but it appears to me that there was, in that instance at least, something deficient, when a man could not hold out against the demands made upon him in that way.

Q. Suppose we had compulsory arbitration, and they decided upon a certain amount of wages. The laborer could accept it or not, as he pleased. He could go somewhere else to work, and would not really be compelled to work at that price.—A. I presume if it had been established by arbitration that all parties to it—that is, reasonable people—would agree. I have not known of a single instance where our people, as miners, have not been obedient to the decrees of arbitration. We may at times feel possibly we have been worsted in the deal, but we have acquiesced.

Q. In that case the operators could be held, being financially responsible, and your trade union, if it was incorporated and had capital, could be held by the courts?—A. Perhaps; I do not know.

Q. (By Representative GARDNER.) Would you favor compulsory methods of enforcing the arbitration upon men?—A. Where the conditions would justify

compulsory arbitration it appears to me that compulsory enforcement would be also included.

Q. (By Mr. PHILLIPS.) How could you compel a man to work?—A. I do not know; that would be rather hard; possibly a penalty would have to be prescribed by the people who made the law on these lines.

Q. (By Mr. C. J. HARRIS.) Have you any objection to the use of injunctions by the courts in case of strikes? If so, state them to the commission.—A. Yes; I have objection to the injunction in case of strikes; at least, I have this objection: I have an objection to the courts curtailing my rights and privileges as an American citizen. Let me give you an illustration of how the injunction affected me personally. I went into the State of Maryland during the great strike of 1894, to the town of Frostburg. My object in going in there was to address a miners' meeting. I was going to explain to them the objects of the strike and what we could expect to gain by it. The meeting, however, did not materialize, and I was going from Frostburg to Lonaconing and to the depot for the purpose of taking the train there, when an official walked in with an injunction which he read to me, saying that I must not interfere with the working of the Consolidated Coal Mining Company's plant, and so on, and restraining me from interfering. I did not know where the plant was; did not know a thing about it. I had not made, at that time, a talk to the miners; had not met more than half a dozen people, miners, though I am free to admit it was my intention, had there been a meeting of the miners, to talk at that meeting.

Q. (By Representative GARDNER.) Do you know whether that was an injunction issued by the State or United States court?—A. I think it was by a county court. I was to appear, I think, in 30 days, in some place, and show reasons and causes why I should not be enjoined. However, I did not appear.

Q. (By Mr. C. J. HARRIS.) What is your idea of the best method of payment?—A. I think our organization, up to the present time, has been pretty well satisfied in establishing the semimonthly pay. We have not asked in our contracts beyond that, though our preamble specifies that one of our objects will be to secure weekly pay days. Up until a few years ago we were only getting monthly pays, and the fact that we now have a semimonthly pay may be a cause for our present satisfaction.

Q. Do you think pay every 2 weeks is pay often enough for anyone?—A. I think a man should have his pay every week.

Q. Why not every day, every hour?—A. It would be a good thing, possibly, to have it every day.

Q. Is there not such a thing as carrying the point too far?—A. Possibly, under the contract system, the number of tons constituting a day's work might be hard to compute by the hour; might be put on the number of tons earned during the day and paid at night. I do not think it would work any additional hardships on our friends, the employers, if they were to pay weekly. You will understand that even under the semimonthly pay there is 10 days to 2 weeks' time held in their hands. They brought the same arguments to bear against the semimonthly pay as were tried here yesterday against the weekly pay—that it was expensive, impracticable, and that the men did not need it, etc., and yet they have been able to do it; it has given entire satisfaction; and possibly the best argument made in favor of the weekly pay is the fact that a man who has his money weekly has the advantage of having that money in his possession and is able to buy in the cheapest cash market, whereas, kept out of his money a greater length of time than that, he is frequently compelled to buy on the credit system, and by reason of that loses the advantage of cash markets.

Q. It has been alleged that the less frequently the payments are made the more apt men are to save up their salaries and the less apt they are to spend in drink a large portion of their wages, and as a consequence lose perhaps the following Monday or Tuesday. Is there anything in that argument, to your mind?—A. No.

Q. Absolutely nothing?—A. No. There may be isolated cases here and there where such is the fact, but I have regarded it in this way: That if a workingman were to spend his entire earnings in drink he would not have much to spend. I do not approve, however, of a man spending his money in drink, but if he were to spend his entire earnings in drink he would not spend a sum exceeding \$300 or \$400 a year. Possibly the average expenditure per man would not exceed that, because our earnings do not exceed that. There are not earnings enough to be very elaborate in dissipation. This idea of mine workers being dissipated men is disproved at once by the amount of their earnings, and possibly the best way to get at the average miner's earnings is from Parker's Report, of the Geological Survey. He is very elaborate on that question.

Let me turn back now on that matter. Possibly the greatest opposition to the

semimonthly pay and to the weekly pay arises largely from this fact: That most of the employers have stores in connection with their mines, and I believe it is some advantage to the employers to make their pays as infrequent as possible, in order that the employees might be compelled—not perhaps as a mandate, but as an indirect method of obtaining what money is going to the employees, by reason of that fact.

Q. Your work in the mines is nearly all paid for by the ton?—A. Yes.

Q. Have you anything to say of the sliding wage scale in coal mining?—A. Not a great deal, only this: That the tendency that I have observed in the sliding wage scale has always been downward. In the anthracite region they do work at the present time on what is known as a sliding scale. Possibly if the conditions at the present time were the same as when the sliding scale was established there could not be very much objection to it. I will give you the conditions in that connection: When this sliding scale was agreed upon, in 1868, I think, it was fixed on the selling price of coal at certain points. The base was fixed in the Schuylkill region, at \$3 a ton for coal at Schuylkill Haven, and in case of any difference from that base the miner was to secure his proportionate share of it, the operator his share, and the railroad its share. And if it decreased from that rate, the result was distributed in the same way. The miners at that time were organized and were allowed representation on this board that determined the average prices. The divisions were made along these lines: If it was a 25 cents advance, the miner got 8½ cents, the operator got 8½ cents, and the railway company 8½ cents. This was the agreement between the transporting companies, the operators, and the miners. Since that time the miners have been denied representation on that board. Since the great strike in 1875, when the miners were whipped and the organization was dissolved, the miners have had no representation upon it, and the prices are fixed entirely by the employers, the men saying that they are not fixed honestly. They are fixed entirely by the employers. We contend that in a question of wages we have a right to be heard; that we have a right to representation upon any board that fixes our wages.

Q. What have you to say of fines and penalties for turning out bad coal, docking, and things of that kind? If a man turns out a carload that is two-thirds slack, fine coal, not mined in a workmanlike manner, is there much trouble from that?—A. Yes; there is considerable docking going on; considerable friction between miners and operators as to these docking questions. Provisions are made for it, even among the miners, in a local way. The position of the organization is this, that they insist that miners shall load as clean coal as possible.

Q. In regard to tenements about the mines, are these generally owned by the companies?—A. Yes.

Q. Have you any special remarks to make on that point?—A. I have a general condemnation to offer for the homes provided by the coal companies for their miners. I have a general protest to offer against the amount of rent that they collect for these homes. Some mining communities have fair homes. Possibly the best miners' homes that I know of are to be found in the anthracite region of Pennsylvania.

Q. Could you expect to find as good homes in temporary mining camps as you could in cities and villages and towns that depend upon a variety of employment and work?—A. The word "temporary" is hardly applicable. Most mines have a life of 25, 30, 45, or 50 years, and some of them longer, and I think the man who builds a house, knowing that his coal supply is going to last that length of time, ought to build a comfortable house for his employee to live in. For instance, take the State of West Virginia; a majority of the houses are of two or three rooms—an upright board, with a clapboard put over the crack. There are no conveniences in the houses; no cupboards are provided; nothing but the bare walls. Whatever shelving the miners need, whatever cupboards they need, they must either buy or improvise in some way. Many of their homes have not proper outbuildings; have not the proper facilities for water; have no conveniences at all around them. Sanitation is never thought of. All those conditions which enter so largely into the comforts of life are never once thought of, and yet these people are expected to pay what I regard as a very exorbitant rent for such houses as that.

Q. Did it ever occur to you that the cabin you have described and the surrounding circumstances not only are true of the coal miners but of all the people in that mountain country, from West Virginia to northern Alabama and Georgia?—A. My experience in West Virginia has been largely among the miners, more largely than any other class of citizens. I believe it is true of the mountaineers that their homes are of the most crude sort. The miners are worse housed than the people who do employment of other kinds where there are little

towns built. They are worse than that. I do not think the comparison is as fair between the mountaineers and the miners as between the miners and other classes of labor.

Q. What rent do they pay for these houses?—A. They pay all the way from \$2.50 to \$6 and \$8 a month. I believe the general rent rate is \$2 a room. I think that is the general rule followed in collecting rent. Two dollars a room possibly would not be objected to so much by the miners if they had houses that had some of the characteristics of some houses in towns; if they were properly built and plastered, and had little cupboards built to give them some of the conveniences; proper outhouses and conveniences around; things that enter largely into the comfortable conditions of life. But all these things are in most cases wanting. Take it along New River, West Virginia, and possibly other places. Let me say for West Virginia, in Tucker County, under the Davis Coal and Coke Company, there is a very fair class of houses. They are two-story houses, four and five rooms, and the rent is, I think, for a five-room house \$10 a month, four-room house \$8 a month. These are not cabins in any sense of the word. They are very fair houses, weatherboarded on the outside, nicely ceiled on the inside—not plastered, but ceiled—and make a very fair class of houses. Aside from that exception, I have never seen in West Virginia what I regarded as comfortable mining homes.

Q. (By Mr. KENNEDY.) Is that the company that Senator Elkins is interested in?—A. I do not know whether the Senator is interested in it or not. His father-in-law is—Henry G. Davis.

Q. (By Mr. A. L. HARRIS.) Are there any gardens or tilling privileges connected with the miners' houses?—A. I think not. I am not positive about that. It seems to me that the topography of the country is entirely against the gardening idea; it is right up on top of the Allegheny Mountains, and these houses I have reference to are strung out at the base of the mountain for a distance of a mile or a mile and a half—from Coketon to Thomas. Thomas is a mining town, built up on the side of a mountain. I did not see any gardens there. These matters of tenements are matters in which I feel considerable interest, and if this commission can devise any way or means to provide these miners with comfortable homes, I would be glad to know it was done.

Q. (By Mr. C. J. HARRIS.) What of the relative conditions of wages from the beginning of your acquaintance with mining to the present time; has there been a change for better or worse?—A. From 1865 to 1868 there was a continual downward tendency. In 1868 the labor organizations began to be formed, and they began to interpose their influence against any further reductions, and for a number of years there has been a gradual tendency, influenced by the organizations, to a better rate. Our struggle, however, has been largely to maintain those better rates against a continual tendency in our business to seek a lower level.

Q. On the whole, is it better, then?—A. No; I do not think that would be a proper definition of it. I am not prepared to say as to the conditions, only from 1872 or 1870. The conditions from 1870 until 1894 were better than they have been from 1894 to the present time.

Q. How about the social condition; has that improved in your recollection?—A. I am hardly prepared to answer that. Let me say as to the educational facilities that they have varied according to the communities, systems, etc. In some mining communities, where there are a large number of people—towns and villages—the educational facilities are what I would term very fair. A boy or girl who can go through their schools comes out of them with a very fair common-school education. But there are mining communities in this country where the school term does not exceed 6 months in the year. That would be a very poor school facility, in my opinion, where there was only 6 months or less, possibly, of school provided in a year for the children. I think that that is a condition more frequently met in the South than in the East or West.

Q. (By Mr. KENNEDY.) Has there been a noticeable decrease of intemperance among miners in your time?—A. I have never found that miners were more intemperate than any other people, and, as for increase or decrease of intemperance, the question has never come up.

Q. I did not mean to insinuate that they have been.—A. We want to get plain on that question. As to the question of intemperance, I do not know whether it has increased or decreased; can not tell you.

Q. If you had noticed a decrease it would indicate an improvement in social conditions?—A. I have tried to explain my ideas on dissipation among miners.

Q. In regard to employment?—A. In our business there has been an increase of employees, I believe, as compared with the increase in tonnage. There is an increase, you know, every year in our tonnage, and possibly the percentage of increase of employees will exceed the percentage of tonnage increase. I am only

giving that as a general opinion. I have not studied the statistics carefully on that subject. There seems to be quite a number of people that have no employment in our trade certain months in the year.

Q. Do you believe in the employment of children in the mines?—A. No children should be employed in the mines.

Q. Are they employed to a harmful extent, do you think, at present, or is that a matter which has been regulated already?—A. In some of the States—in Ohio, I think, for instance—a boy must be 14 years of age before he goes into the mines. I do not know whether that is a law in the other States or not, but I do know that in the anthracite regions of Pennsylvania when I was a boy there were some very small boys in the mines. I myself went into the mines at 8½ years of age, and there were plenty of boys as young as I was. You can see at once that it was an injustice to the boy who was compelled to go into the mines at that early period of life. It prevented him from acquiring the physical and mental development that he was entitled to. Boys are not sent into the mines now, as a rule, as young as they were before, and they should not be sent in. Some say that they should go in at 14, others at 16. My opinion is that a boy 18 years of age is young enough to work in the mines. If it were possible at all, my idea is that no boy should work at any calling until he had graduated at least from some of our common high schools. That is my idea of education; and if it is possible, follow up that with higher education. A boy or girl should be educated to the full extent of the parents' ability. Anything short of that is a great injustice to them.

Q. (By Mr. PHILLIPS.) Is it not more at the desire of the parents than of the employer that the children are employed?—A. This is a fact; that the conditions in which many families find themselves, the inability of the father to earn sufficient money to maintain the family, compels him to take his boy with him in order that the boy may assist in the breadwinning for the family.

Q. Then they are not sought so much by the employers as by the parents?—A. I do not know how that may be in other occupations, but there are some occupations that boys can do in the mines and employers are very ready to get them to do it, because of the cheaper wage rate paid a boy; but I think in most cases that the fact is due to the inability of the breadwinner to get enough money to maintain his family as he would like to maintain them, and the boy is compelled to assist in that way.

Q. (By Mr. C. J. HARRIS.) What are the causes of irregularity of employment in mining?—A. The principal cause of irregularity of employment in mining is overproduction, or underconsumption possibly—the market requirements of coal.

Q. Any Sunday labor?—A. Not as a general rule. It is an unusual case—where there is something that must be done.

Q. What have you to say of the shorter workday and its effects?—A. I think I said that we were unable, by reason of the recentness of the establishment of the shorter workday, to get at a fair knowledge of its effects from the statistical standard. However, I said last year we had increased our tonnage about 12,000,000 tons. It is very evident to me that we did not suffer very largely by reason of the institution of the shorter workday.

Q. Cooperation, premium sharing, industrial copartnership—ever have any experience with these?—A. No.

Q. (By Mr. RATCHFORD.) Possibly you may be able to give us direct information in regard to screens, because of your general knowledge of mining conditions throughout the United States.—A. Screens are as various as the conditions of mining.

Q. Do you regard the screening system as a beneficial one?—A. No. The organization has practically declared against screens—has always declared in favor of the mine-run system of weighing. We think that the mine-run system is the fairest and that it ought not to be a question in the pay of a miner as to whether the coal would go over a three-quarter screen, or inch screen, or inch and a quarter, or 3 inches; that that is a matter of preparing for the market, a matter that the operator himself should be interested in. However, the conditions confronting us at various times have been of such a character that we have waived that principle and have agreed with our employers on a double standard. In other words, we have agreed to accept pay for screened coal and for mine run, but it was because it appeared to us the only thing to do in order to establish our contracts with our employers and to make our agreements with them. We were waiving certain things we considered we were entitled to and it was right we should have in order that certain other things might be obtained.

Q. How about the unorganized men of your trade; have they expressed themselves by action or otherwise in favor of or against it?—A. I have never known

a miners' meeting where the question of payment for coal came up that the miners were not unanimously in favor of the mine-run system, without respect to organization or unorganization. They demand the mine-run system at all times. In fact, it is one of the universal demands of the craft.

Q. (By Mr. C. J. HARRIS.) Have you anything to say on convict labor?—A. Outside, I think, of one State we are not very much troubled with convict labor in our particular business as miners; however, as a trade unionist, and as a man who believes it as a matter of principle, I do not believe that the production of the convict should come into competition with the production of the free man. It has a demoralizing tendency on the markets that practically belong to the free people.

Q. (By Mr. PHILLIPS.) About what per cent of colored people are engaged in the mining industry?—A. I do not know; possibly 10 or 15. Our organization does not draw the line on colored people.

Q. (By Mr. C. J. HARRIS.) What is the effect of the use of machinery in mining?—A. I am going back to the Geological Survey Report, which offers possibly the best solution for this question. The effect has been on the one hand to reduce the number of employees in the mines. The object, I believe, in introducing machinery was to increase profits and lessen the probabilities of strike. I think possibly these were the two objects. Whether they have lessened the possibility of strikes or not I do not know, but they have cheapened the production. The benefits they expected to get, so Mr. Parker says, from the introduction of machinery have not been realized because of the cheapness of the production; in other words, the consumer has had the benefit, and not the operator, while it is possible the introduction of machinery has displaced everywhere from 30 to 50 per cent of the employees. I am only giving you this as a rough estimate.

Q. (By Mr. KENNEDY.) Can you state in what year that report was made by the Geological Survey?—A. 1897.

Q. (By Mr. C. J. HARRIS.) Has the machinery used in coal mining been improved much since it was started?—A. Yes; there has been an improvement. I think the chain machine is an improvement over the old punching machine, as we called it.

Q. Some improvements being made all the while?—A. Yes.

Q. (By Mr. RATCHFORD.) If the machinery displaces labor, how is it possible that the increased number of miners, as compared with last year, is greater than the increased production, as compared with last year or any former year?—A. I do not know. I do not think I made that as a positive statement. I said I thought that the percentage of increase of employees was greater than the percentage of increased tonnage. It appears to me that possibly if we could base it entirely on the pick mining it might not be; but the fact that the machinery comes in, displacing the pick miner, makes as against the total production and the total number of miners. The increase would be greater. Possibly that is the explanation I should have given. I think that the question of foreign markets is largely one of cost. If we can get into the foreign markets cheaper than our competitors, then the foreign markets will come to us. If they can beat us they will take them. That is, in a general way, my idea of foreign markets, if the commission intends by this question of foreign markets to refer to foreign countries.

Q. Can you say anything as to the relative cost of producing a ton of coal in the various coal-producing countries?—A. No; I can not at this time; but it appears to me that that table can be obtained by the commission from the report I have frequently quoted—Parker's Geological Report.

Q. You would regard it as a good thing for the mining industry to extend these markets if possible?—A. Certainly; anything that would tend to increase the consumption of coal is a good thing.

Q. What have you to say as to industrial and remedial legislation?—A. I do not know as to the employers' liability law. I think most of the legislatures provide in some manner for such an emergency. As to the sanitary and personal-safety law, so far as our business is concerned they are usually placed under the various State departments of mining and come under the supervision of the mine inspecting force. Check-weighman laws, I think, in most of the coal-mining States are provided for. I am not positive of that statement. I think it is true of the States of Kentucky, Indiana, Illinois, Ohio, Pennsylvania, Iowa, Missouri, and Kansas. Aside from that, possibly, I would waive any opinion in the matter.

Laws regulating the employment of children are rather difficult laws because the conditions of the family, etc., enter largely into it. I do not think myself, as a general proposition, that any boy should be employed in the mines until he has reached the years of 16 or 18.

Q. As to sanitation and personal safety laws, the ventilation laws would come under that.—A. I presume that is what is meant there—ventilation laws. I think the States of Pennsylvania and Illinois lead in that principle.

Q. What has been the general effect of these laws within your recollection? Are greater precautions taken for the protection of the miners and for the ventilation of the mines to-day than some time past?—A. Yes.

Q. The laws have brought about an improvement in that particular, have they?—A. Yes; there is a vast difference between the ventilation of the mines at the present time and that which was formerly in effect, when I was a boy. At that time the old furnace, perhaps, if there was anything outside of natural ventilation, was the means. At the present time we have the fan and other improved methods of ventilation, which I, as a boy, did not see; and, on the whole, there has been a great improvement in this direction, due, of course, to the mine-inspection laws of the various States.

Q. Have you any suggestions to offer for remedial legislation?—A. I stated before the commission yesterday, in effect, that what the law did not enable me to obtain the power of the organization can obtain. I do not know that I am so particular for legislation, unless it would be to further strengthen and support the action of the organization. We got the 8-hour law, not through legislation, but the power of the organization and the methods adopted. In that connection, possibly, it might strengthen our position to have legislative enactments. There are, I believe, some State enactments, some national enactments, along these lines. Every sentiment, however, of all the labor organizations, as well as ours, is in favor of the 8-hour day. They have been unable, up to the present time, to secure that legislation which appears to me necessary to get the full extent and scope that the old custom of labor had.

Q. (By Mr. PHILLIPS.) What States have the best laws for the mining industry?—A. I am unable to say that. All the States have some good features and good laws, and possibly the best way to learn that would be to devote some time to the question of laws and study the various laws of the several States and make a synopsis.

Q. Has not the condition of the miner been vastly improved by State legislation?—A. Yes.

Q. What about sanitation?—A. The system of State inspection has done wonders to improve the sanitary conditions of the mines. Most of the States provide for mine inspection, and the inspectors see that there shall be a sufficient air current to remove the impurities and gases that accumulate by reason of the consumption of powder and all the excretion of the people in the mines. These things contribute to the better sanitary condition of the mines.

Q. (By Mr. RATCHFORD.) I would like to ask the witness whether or not the regulation of trade affairs, such as have been enumerated, the questions of differences between employers and employees, should be accomplished as far as possible by their trade organizations, without intervention; would it lead to the best results?—A. I think it would. I think that if there are differences between me and another man and we get together to settle those differences, it is a very satisfactory way of doing it. Collectively we are only an aggregation of individuals, and if it is good for a couple of individuals to do so, it appears to me that it would be a good plan for the aggregate to follow. I know that it is the method that our organization believes in—that it is a good way to settle our difficulties.

Q. In other words, you believe that agreements voluntarily and mutually made between the interested parties are the best kind of agreements, inasmuch as neither party is forced to accept them against his will?—A. Yes.

STATE OF INDIANA, *County of Marion* :

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

THOS. W. DAVIS.

Sworn and subscribed before me this 23d day of July, 1899.

JAMES STEVENSON,
Notary Public.

My commission expires August 4, 1901.

WASHINGTON, D. C., April 15, 1899.

TESTIMONY OF MR. BENJAMIN JAMES,*Member of the National Executive Board, United Mine Workers of America.*

The commission met at 10.30 a. m., Vice-Chairman Phillips presiding. Mr. Benjamin James, of Jeanesville, Luzerne County, Pa., was introduced at 2 p. m., and testified with reference particularly to the conditions of coal-mine labor in the anthracite region of Pennsylvania, the topical plan of inquiry on mining being followed.

Q. (By Mr. RATCHFORD.) How long have you been connected officially with the miners' organization?—A. I have been connected officially with them since December, 1897.

Q. What were you engaged in prior to that time?—A. Prior to that time I was engaged at my occupation as a miner, and have been mining since that time. In fact, I was actively engaged as a miner up to the 6th of January of this year. That was the last day I worked in the mines. I left the mines at that time to attend the annual convention of the united mine workers. At that convention I was elected as a member of the national executive board of the organization, and I resigned when I returned to my home.

Q. (By Mr. PHILLIPS.) Of what nationality are you?—A. I am Welsh; I was born in Wales.

Q. At what time did you come to this country and how old were you?—A. I came to this country some time in the 70s when a very small child. I was born on the 3d day of December, 1867.

Q. (By Mr. RATCHFORD.) Have you mined coal in the anthracite region during your whole career as a coal miner?—A. No; not during my whole career. I mined coal in the State of Iowa; in fact, that was where I first entered the mines. I was then about 12 years old. In Iowa I mined coal until the spring of 1886, I think, or, in other words, about 6 years. In the anthracite region I have been actively engaged as a miner and mine laborer for 9 years.

Q. Take up the plan of inquiry and discuss the points you care to talk of.—A. The growth of trade unionism, I would say, has been very slow in the anthracite, but at the present time there is more than a normal desire on the part of the unorganized workmen there to affiliate with the organization of their craft. The proportion of total employees in the organization is small.

Q. (By Mr. PHILLIPS.) About what per cent?—A. That I am not prepared to state positively. I would not like to make any statement here that I would not be certain of.

Q. About how many are engaged in mining the anthracite coal?—A. In and around the mines in the year 1897, which is the last that we have a full account of, there were 149,557, if I am not mistaken, according to the mine inspector's report of that year. The report of 1898 has not been printed as yet.

Q. Can you give a guess of the approximate number belonging to your organization in that region?—A. I can not, as the anthracite is divided into so many fields; and there are portions of the anthracite that I have never been in.

Q. About when was the first organization of your union formed in the anthracite field?—A. I should judge about 1894, probably 1895. The organization in the Lehigh region was formed in 1897, a few of the branches being formed prior to the Lattimer trouble, and some of them after that time. The local branches in the Wyoming field were formed in the latter part of 1897 and in 1898, while the Lackawanna Valley, Scranton and vicinity, were not organized, or no attempts were made to organize them, practically speaking, until a short time ago, when I went in there.

Q. This present year?—A. Yes; in the month of March.

Q. Does quite a large per cent of the miners go into the organizations when they are first formed?—A. Yes; in the localities with which I am acquainted.

Q. Is there quite a large per cent of your miners that have not joined it?—A. Yes; there are quite a number.

Q. Do the miners generally approve of it that are not members?—A. They do. They all approve of organized efforts. Even those that are not members acknowledge that the only way that they can receive justice at the hands of their employers is by organizing. There are many who will not join the organization of their craft, for reasons best known to themselves. Probably one of the chief reasons is that some of them are shown favors; they have better work from their employers, and the employers use these men to try to prevent others from going into the organization.

Q. Are employers there, as a rule, opposed to your organized effort?—A. While they are not all opposed to it, yet the majority of them are bitterly opposed to it.

Q. (By Mr. RATCHFORD.) You have made the broad statement that the employers use those men to prevent others joining the organization. Can you point out any instance in which that has been done?—A. They do in all sections; and I will state more positively, in the Lehigh region and in the Wyoming Valley, where the employers have men who are given gangways to drive, and the best of work, and we find that it is impossible to organize those men. We find no trouble with the man who has the average work or with the man that has poor work.

Q. Can you name an operator who is guilty of that charge, or coal company, to your positive knowledge?—A. No; I can not, to be positive. I was led to believe that through the miners whom it is possible to organize and the miners whom we can not organize.

Q. Then the circumstances point to it, but as to positive proof you have not any.—A. The circumstances point to it. That is all I care to say on that subject.

We do not prevent anyone from making any contract which he thinks proper to make, at any time. We are always willing for the individual to make his contract, but we try to point out to that individual the ill effects of those contracts, provided he makes them at a less rate than has been paid prior to that time. But no force is taken to prevent them from perfect liberty of contract.

Q. Do we understand from that that the mine operators are privileged, according to the rules of your union, to employ whom they please and when they please?—A. They are.

Q. The miners do not object to that, whether organized or unorganized?—A. They do not; but after they employ them, we try by peaceful means to have those men join our organization.

Q. What have you to say of strikes and arbitration?—A. There are many causes leading up to strikes; the strikes, for instance, of the old Workingmen's Benevolent Association; they struck against what they thought was an unjust reduction; while the strike of 1897 in the anthracite at Audenried was caused by the brutality of the mine superintendent.

Q. (By Mr. PHILLIPS.) In what way did he show his brutality?—A. By striking a driver with a club.

Q. Did that one act lead up to the strike?—A. That one act led up to the strike, but their condition at the time was such that they thought some steps should be taken to remedy or improve it.

Q. Had he exhibited violent temper, overbearing disposition, prior to this?—A. He did, to myself for one. I was discharged from that colliery because I would not submit to what I considered an injustice.

Q. (By Mr. FARQUHAR.) Did the men attempt any appeal to the owner of the mine?—A. They did. This was in regard to the strike that led up to the Lattimer trouble.

Q. Through individuals or through a committee?—A. Through a committee of miners.

Q. Did the operators receive the committee and consult at all?—A. They received the committee and consulted with them, but refused to take any action.

Q. Was the demand of the committee to discharge the superintendent?—A. Yes.

Q. And the owners would not comply with the demand?—A. They would not comply with it, although it was proved that he had committed this act.

Q. That his actions as superintendent were unfair and unreasonable?—A. They were unfair and unreasonable, and wholly uncalled for.

Q. (By Mr. PHILLIPS.) Generally conceded by the workers in that mine?—A. It was unanimously conceded.

Q. (By Mr. FARQUHAR.) How long did the strike last?—A. The strike lasted from the latter part of August until the latter part of September.

Q. What was the result?—A. The men returned to work after the company had signified their willingness to remedy some of the evils. While the superintendent was not discharged, the men did not press that matter after the company had signified a willingness to treat with them on other questions.

Q. So that the strike brought about a modification of the conditions?—A. It did, and the conditions at that mine are much improved from what they were prior to that time.

Q. There is a sense of good feeling between the operators and the miners?—A. There is a much better feeling existing now than there was prior to that time.

Q. (By Mr. RATCHFORD.) You are speaking now of the strike that led to the unfortunate shooting affair, are you?—A. To the unfortunate shooting affair at Lattimer.

Q. Was this strike you speak of a regular organized strike, brought about by

organized miners, or otherwise?—A. It was not. The miners were not organized, speaking of them in general, while there was a small number organized.

Q. Not being organized, they had no controlling head, or officer to advise, did they?—A. They did not.

Q. (By Mr. PHILLIPS.) Did they not select or appoint leaders when they went on the strike?—A. No; they did not appoint any leaders. Leaders appointed at such a time do not have the influence over the men that leaders of organized labor do. If any trouble should arise in either the Wyoming or Lackawanna Valley at the present time, the field in which I am engaged, I am satisfied that the men would be willing to reason; I am satisfied that I could induce the men to listen to all reasonable arguments and be reasonable in every way, while, on the other hand, had they no leader in that field, each one would do what he thought was right, and oftentimes by so doing they do that which is not right. That is one great advantage, and what I call a benefit, not only to the community but to the country at large, that we have with organized labor.

Q. What nationalities are chiefly engaged in the anthracite fields as miners?—A. There are several nationalities—the Welsh, Irish, English, a small number of Germans. The largest number are Polish, Slavish, Lithuanians, Hungarians, Italians, and many others.

Q. (By Mr. RATCHFORD). Those latter nationalities that you speak of are what are known among the miners as the non-English-speaking miners?—A. Yes.

Q. What percentage of the whole is composed of the non-English-speaking miners in your region?—A. I would say they were fully 60 per cent.

Q. Now, as to their habits, customs, and standard of living, have you anything to say, comparing them with the English-speaking miners, as they are called?—A. Their habits are different from the English-speaking miners' habits. I would, in the first place, wish to return to the time that they were brought into the country, in order to lay this matter before you. They were introduced into the anthracite region about the time of the strike between organized labor and the operators in 1875. They were brought in there to cause confusion, I suppose, to a certain extent—or, at least, it is generally supposed so—among the ranks of the miners, knowing that the miners with so many different nationalities would not be in as good a position to maintain prices as they were with the English-speaking people. There are so many nationalities of them that many of them even did not understand each other. From that time they have been in the anthracite. They do not build homes, as a rule, or live as the English-speaking people try to live. They are, with few exceptions, the poorest class of foreign people, the class without any education, practically speaking, and at the present time thousands of them do not understand the English language, while others have very good English. It is almost impossible to tell what nationality they are unless by their names.

Q. (By Mr. FARQUHAR.) Are they usually naturalized citizens now?—A. There are a great many, while others only come here for a few years and then return to their native land. Their manner of living is such that even with the small wages paid some of them manage to accumulate considerable money. They can live on what would starve English-speaking people.

Q. Are they usually men of families or single?—A. There are a great many with families, while there are thousands of them without families.

Q. Among these non-English-speaking people, how many in 10 are there that have families and have American social life?—A. That I am not prepared to say; in different sections they differ.

Q. (By Mr. PHILLIPS.) Do they work in the same mines and in the same rooms with the English-speaking people?—A. They do.

Q. Are they generally mixed throughout the region, or are there some mines run wholly by English-speaking and others wholly by non-English-speaking people?—A: There are none that I can say are run wholly by either; yet I will name Carbondale, Pa., for instance, as being run almost exclusively by English-speaking people; and the operators at that place, so I am told by the miners, do not want the foreign labor, while in other sections they prefer the foreign-speaking people.

Q. (By Mr. KENNEDY.) Do we understand that the Poles are a Slavonic people, and that when you speak of Slavs you speak of the Poles, too?—A. No; the Polish and Slavish are different. The Polish and Slavish languages are different, although a majority of the Polish understand the Slavish language, and vice versa.

Q. (By Mr. RATCHFORD.) As to their habits, methods, and standard of living, have you anything further to say?—A. Their habit of living is this: The unmarried men board with the married people, but in far greater numbers, according to the size of the houses, than the English-speaking class would. You will see 15 or 20 of them in the same house of 4 rooms. They pay so much to the landlady for

the privilege of staying there, sleeping there, and cooking, and they buy their own provisions, or they have their landlady buy the same for them and charge to them. A great many of them have store books of their own. In this way they live very cheaply. The meat they buy is chiefly boiling—the cheapest kind of meat—and that cheap meat and potatoes, with black coffee and bread, in some cases butter—but it is not used to any great extent among them—constitute their living.

Q. (By Mr. PHILLIPS). Some vegetables, I presume?—A. Some vegetables, but not as a rule.

Q. (By Mr. RATCHFORD.) You spoke of these people adapting themselves in some cases to our language. Where such is done, do you find that they also adapt themselves to the manner and standard of living of the American people, or approach it more nearly than those who do not adapt themselves to our language?—A. They approach it more closely. In fact, you will find some—you would scarcely know but what they were Americans at the present time. Those are people that came to this country when they were very young. Many of them, when they were small children, were brought here by their parents. They have lived here continuously since that time, and they approach more closely the manners and customs of Americans than those do who come here in later life.

Q. Do you believe that it requires more than one generation for them to adopt the American customs?—A. While they may adopt some of the American customs, they will not adopt them as a whole, for this reason: They are being brought up by foreign-speaking parents and become accustomed to their parents' way of living and manners to a certain extent, so that they can not be brought to the ways and customs of American people in one generation.

Q. (By Mr. FARQUHAR.) Are your non-English-speaking foreigners there permanent now in their location, or do they shift from that district to other districts farther west?—A. They are continually moving.

Q. Are there many new coming in of these non-English-speaking peoples?—A. There are quite a few, although they do not come in such numbers as they did a few years ago.

Q. They come in more individually and isolated, and they used to come together in large numbers?—A. Yes; although you will occasionally see a train load come in now, but not very often.

Q. (By Mr. RATCHFORD.) Where they come in such large numbers, is it usually supposed that they come of their own free will?—A. It is usually supposed so. In fact, we have no proof to the contrary. Many of those that come to this country send back for their parents, brothers, and sisters, etc. Whether it is that that causes them to come in such numbers or not I can not say. As I said, we have no proof that any of them are brought in by contract.

Q. (By Mr. FARQUHAR.) Your general opinion is that most of those come in under the inducements of relatives, who send tickets to Europe and bring them here?—A. They come under the inducements of relatives and friends, I believe.

Q. As far as your knowledge extends, those that came first came in before the contract labor law, and the mines were originally filled that way?—A. They were originally filled that way.

I wish to state further in regard to that strike of 1897 that it resulted in great benefit to many of the anthracite mine workers. The workmen of the Lehigh and Wilkesbarre Coal Company were greatly benefited by that strike. The day men were given an increase of wages, while the contract miners received a slight advance. Not only with the Lehigh and Wilkesbarre Coal Company, but where I was employed at that time, Jeaneville, under the Lehigh Valley Coal Company, we gained considerable—while I can not say an advance, yet it amounted to that.

Q. What are we to understand by contract miners?—A. Those miners who mine coal by the car measure. At that time the miners of Jeaneville were compelled to buy their supplies of the company. The word "supplies" means powder, oil, cotton, and all things that may be needed to mine and produce coal. I say we were compelled to do so for this reason: In July or August of 1897—I will not be positive—the mine foreman employed by the Lehigh Valley Coal Company at Jeaneville went through the mines with a list of all miners who bought their supplies of the company and a list of all those who did not. He called at my working place and asked my partner and myself where we bought our supplies. My partner told him we got them where we could buy them cheapest. The mine foreman told us that he had been instructed to tell us that unless we bought our supplies from that company's supply store we could take our tools out.

Q. Did you take your tools out?—A. We did not; although we were told if we did not buy our supplies or some supplies there that month that we could take them out. But the strike of 1897 came on and prevented them from carrying out their threat.

Q. (By Mr. PHILLIPS.) Did they charge exorbitant prices for supplies?—A. They did.

Q. Much larger than you could get in the village or town near there?—A. They charged \$2.75 per keg for powder, when we could buy from individuals or persons running individual stores for \$1.25 and \$1.50 per keg all we wished of it; and those coal companies bought, and buy at this time, powder at 90 cents and \$1 per keg, while they charge the miners \$2.75 per keg for it.

Q. And charge for the other materials of which you spoke proportionately?—A. Yes.

Q. The same price will illustrate all?—A. Yes.

Q. Did they make the same discriminating charges or overcharges for provisions?—A. They do at many places. At that place there was no company store. There was a store in Jeanesville that was owned and operated by Mr. J. C. Hayden, who had previous to this time operated these collieries. All provisions that were bought in that store by miners were paid for through the company's office. I may say they did not compel miners to buy of that store, and it did not belong to the coal company.

Q. Do the company stores prevail to any great extent through the anthracite region?—A. They do.

Q. Both in regard to supplies and provisions they largely prevail, do they?—A. As far as supplies are concerned, there is not a colliery in the anthracite region to-day at which they do not keep supplies for the miners—not one; and while the operators will say that the men are not compelled to deal with them, they will not employ them if they refuse.

Q. Provisions and store goods as well?—A. Not at all of them; at a great many they do. The coal operators will say that they do not compel miners to buy their supplies with that company. While this may be true in regard to oil in some places, yet they are compelled to buy their powder from these companies where they work, for they will tell you that if you do not buy your powder there you can work where you buy it.

Q. Will you give to this commission the name of the company for whom you were working when this compulsory treatment was imposed upon you?—A. I think I did; the Lehigh Valley Coal Company.

Q. (By Mr. RATCHFORD.) Will you name the man who circulated the paper through the mine and who used the compulsory methods?—A. It was Mr. William Hale, foreman of No. 12 slope, at Jeanesville, Pa.

Q. How many kegs of powder usually will 2 men who are working together use in an ordinary month's work?—A. I wish to enter into this quite extensively. I have spoken with men lately who stated that owing to the hard nature of the coal which they had to blast they have used as many as 12 kegs of powder in 1 month.

Q. Two men?—A. Yes; 2 men. While that is above the average, I will say that 6 kegs is a fair average. In 1897 there were over 1,272,000 kegs of powder used in the anthracite; or, in other words, at \$1.50 per keg above what we could buy it at from individuals, we were overcharged \$1,908,000 on powder alone.

Q. Have you anything to say as to strikes?—A. In the strike of 1897 the workmen, when shot by Sheriff Martin and his deputies, were patrolling the highway, but at some distance from any colliery.

Q. (By Mr. FARQUHAR.) How far from any colliery?—A. I should judge at least 300 yards.

Q. How many were together in the patrolling?—A. I can not say how many there were.

Q. Was that patrol armed or without arms?—A. They did not have any arms about them; neither guns nor revolvers. All that was found upon them were small pocket knives, such as we may carry.

Q. (By Mr. PHILLIPS.) How many persons were shot and killed and how many were wounded and recovered in that strike?—A. I am not positive whether it was 18 that lost their lives or not; there may be a few more. A great many were wounded; how many I am not positive. There is one at the present time in the Hazleton hospital who will never recover.

Q. (By Mr. FARQUHAR.) Were the killed and wounded all so-called strikers, or were some of the sheriff's posse included in those killed and wounded?—A. There was no one among the sheriff's posse either killed or wounded, for the reason I have stated, that the strikers were not armed; and had that sheriff and his posse used the means which they should have used that shooting would not have happened; that I am satisfied of. My reasons are these: A few days before this time, while marching along the highway, the strikers were met by Mayor Altmiller, of Hazleton, with a few policemen, probably three or four, and were told that they would not allow them to march through the principal streets of Hazleton. He

talked peaceably to them, and by his kind manner induced them to go another route. The men had not the least intention of doing damage; that I am positive of, because those that were marching at that time—a great many of the strikers I was acquainted with, had worked among them; and, as I say, had the proper steps been taken, that shooting at Latimer would never have occurred.

Q. (By Mr. RATCHFORD.) What do you assign as being the principal cause for that shooting?—A. The principal cause that I assign is this: They wished their men to go back to work without the advantages that the men hoped to gain, and they thought that by this method they would cow the men down, so to speak, so they would be afraid to look for what they thought was just. I can not assign any other cause.

Q. Anything to say on the subject of injunction?—A. The injunction in strikes—we have not been subject to that as yet; in fact, they have not been given a chance to issue an injunction; but I will say that injunctions should not be issued. It has a tendency to keep a man down to the low level he is at present, or, in other words, it gives the coal operators an undue advantage of the miners.

Q. (By Mr. KENNEDY.) Has that been resorted to in the Pittsburg district?—A. Yes. In any differences that may arise between anthracite men or between the organized portion of the industrial workers and the employers we are ready at all times to try and effect a settlement by conciliation, and, failing in this, we are willing to submit the matter to arbitration; and strikes will not be resorted to until all peaceable measures have failed.

Q. (By Mr. PHILLIPS.) What have you to say in regard to weekly, semimonthly, or monthly payments?—A. I wish to say that a law was passed in Pennsylvania stating that employees should be paid semimonthly "on demand." Those two words prevented the miner from receiving his wages semimonthly, because if he demands it there is no more work for him. There is one company in the anthracite to-day that is paying semimonthly—Coxe Bros. & Co. At the time I first went to work for the Lehigh and Wilkesbarre Company at Audenried, Pa., they paid their employees semimonthly, but for the last three years and a half they have paid them monthly. The reason why they made this change I can not say. We are in favor, however, of a weekly payment; if we can not get that, we would like by all means to receive our pay semimonthly. The reason for this is that the workmen could spend the small amount of money they earn to a better advantage; they could buy the necessities of life at a much cheaper rate than they can at the present time, for with the monthly payment the majority of miners use the store book, and they as a rule charge more in those stores than at places where they deal strictly for cash.

Q. Have any of your miners, either singly or collectively, demanded, in compliance with that law, the pay due them?—A. I have been told that they have, and have received it, but could not get employment at that colliery afterwards. I can not positively state the fact. I would be led to believe that such was the case from the fact that they do not pay semimonthly, as the law says they should pay, and have been told so by many.

Q. What is your rule of mining in the anthracite region, by the ton or by the car, and the price?—A. At Jeanesville, Pa., and the Lehigh Valley Coal Company the size of the car is 103 cubic feet. Forty cubic feet will make a ton of coal. The miners get paid for that car 77 cents. For driving what we term in the anthracite region the gangway, or what is known in bituminous coal mining as an entry, they receive \$4.22 per yard. For blasting bottom rock, where it was necessary to blast such in order that the car may go, they receive \$1 per foot. For timber they receive \$1.63 per set. A set of timber is three pieces, known to the miner as two legs and a collar. For props they receive from 50 to 75 cents each. For airways they receive \$2.75 per yard. For heading between working places—they are driven so that the air current may be brought up nearer to the working face of the mine—they receive \$2.14 per yard. Company miners receive \$1.98 for 10 hours' work. Company laborers, or all other inside help working by the day, receive \$1.10, \$1.44, and \$1.64—three prices. What is known in the anthracite as a patcher receives 89 cents per day; door boys, 69 cents; oilers outside, \$1; carpenters, \$1.65 to \$1.75; blacksmiths, \$1.75; stationary engineers, from \$42 to \$45 per month; firemen, \$40. A fireman works one week on day shift and one week on the night turn. The week they are working days they work 10 hours, and when at night work 14 hours, and for this price they have to work every day in the month, Sunday included. Other laborers outside, in and around the breaker, receive \$1 to \$1.20 per day. The majority of them receive \$1. The old man who is not able to follow his occupation as a miner any more is sometimes given employment in the coal breakers. They receive generally 90 cents per day. Boys on the breakers at that place receive from 50 to 75 cents per day. The house rent—they live in company houses, nearly all of them—is \$5 to \$6 per month. A reduction in the house rent was granted on request of the miners in 1897, at the time of the strike.

Q. (By Mr. FARQUHAR.) You spoke of houses. How many rooms?—A. Three and four. The coal is sold to the miners at \$1.75 and \$2.75 per load, according to the size and grade of the coal.

Q. (By Mr. PHILLIPS.) That is, by the wagonload?—A. By the wagonload. It is supposed to hold 1 ton. The miners are charged that price for the coal that they burn.

Q. (By Mr. RATCHFORD.) Do other than miners buy it in the open market for the same price?—A. As a general thing, they do. Still in some cases the miners receive their coal at a cheaper rate than those that are not employed by the companies; but that is not the rule. Miners are supposed to pay, and do pay in nearly every instance, the same as those not employed by the company.

Q. (By Mr. PHILLIPS.) What can a good practical miner make per day in mining by the car?—A. I have worked in places where I was fortunate to earn \$2, probably, and sometimes \$2.50, while I have worked in other places where I was not able to earn \$1, and would work equally as hard, sometimes harder than I did when I was earning a larger amount.

Q. On the average about what do they earn per day?—A. I have here my checks for my last year's work, and I was employed at one of the best-paid collieries in the anthracite. My earnings last year were \$404.

Q. (By Mr. RATCHFORD.) How many days did you work?—A. I would not be positive in stating that, but about 240, for the anthracite miners go in and work a great many days when the collieries are not working.

Q. Will you explain to the commission what advantage it is to the miner to go to work when the colliery is idle—colliery not hoisting coal?—A. There is some advantage, or they appear to think it is an advantage. On the other hand, I do not think it is an advantage, for this reason: In the anthracite at the present time each colliery is allowed so many cars to fill for a week or a month by the company. The miner goes in the mines and works on idle days, and he is thus able to load a larger amount of coal than he could had he not worked this idle time. The company is able to fill their quota for that colliery in a much less time by this method than they would were the miners not to work on idle days. I think, if it were possible, something should be done to prevent any miner working in the mines when the colliery is not running. I will give my reasons: At the colliery where I worked the miners only work 3 days per week, and the miners work the other 3 days preparing their coal to load. They can by this method market 400 cars of coal each day. By this I mean mine cars. Were the miners not to go in on idle time, 250 cars would be the limit; so that it would take the company almost 5 days to get the 1,200 cars of coal from the miners which they want from that colliery; but by the miners working idle time they get these 1,200 cars in 3 days, because they could hoist 400 cars each day. By so doing the miners deprive all inside day help and all outside help of these extra 2 days; but that plan is carried on to-day in the anthracite to a great extent. There is one place in the anthracite where they have a car of 171 cubic feet, or, in other words, over 4 tons. For that the miners receive \$1.08, or 27 cents per ton.

Q. Does that mean 27 cents per ton for run-of-mine coal?—A. Yes.

Q. You are not bothered with any screens there?—A. We are not bothered with any screens. We are troubled with something worse than screens—the docking system.

Q. (By Mr. FARQUHAR.) Describe it.—A. The dockage system is this: The company have what they call a "docking boss" on every coal breaker. When the cars of coal are dumped he is at liberty to take one-quarter, one-half, three-quarters, and in many cases he takes the whole car from the miner, after the miner has mined it, and in some collieries in the anthracite to-day they dock on the average from 10 to 12 cars out of every 100. At the place where I was employed last, at Jeanesville, they never took less than a full car, and in my career there as a miner I was docked sometimes as high as 2 cars out of 4. When I would load and mine 4 cars in one day, a docking boss would take 2 of those from me. For these 2 cars I would not receive one cent, although I had blasted that coal, had paid for my powder and other supplies, and had been put to a great deal of expense oftentimes to get that coal.

Q. (By Mr. RATCHFORD.) How much coal was there in those two cars?—A. That car held, I would say, to be within bounds, at least 2½ tons.

Q. (By Mr. PHILLIPS.) What was the cause of your being docked?—A. They claimed it was because there was too much slate, or at other times they would say there was bone in it. What the miner calls bone in that section is a bony substance not fit for market. It is found in the vein of coal. I was docked full cars of coal while mining when I was positive and could have taken an affidavit there was not 25 pounds of impurity in any one car. And further, either in

October or in November of last year, I was docked when working in a place where I had no slate, and they deliberately took my coal from me; and after I had gone to that docking boss he acknowledged that he did me an injustice, and he gave me the car back.

Q. Will you state the name of the company for whom you were working?—A. The Lehigh Valley Coal Company. That prevails throughout the whole anthracite.

Q. (By Mr. A. L. HARRIS.) What becomes of the coal that you were docked?—A. It is put by the company into the same chute as the coal they pay for.

Q. They do not take any of this out?—A. They do not take any more out than they do out of cars paid for. It is all dumped in the same chute.

Q. (By Mr. RATCHFORD.) And is it sold for the same price?—A. Yes. At the last time I was docked, either in October or November of last year, when I spoke to that docking boss and told him I would demand payment for that car, he gave me that car back and told me that I was the most honest man he ever met, and that he would never dock me another one. I can give you the name of the man who did this, if you choose.

Q. Let us have it.—A. James Peacock, of Jeanesville, Pa.

Q. (By Mr. PHILLIPS.) Have you reason to believe that these docking bosses are instructed to dock by the company for which they work?—A. They are; they have told me so.

Q. In order to reduce wages in that way?—A. They did not say what it was for; but they have often told me they were instructed by the company to dock that coal.

Q. (By Mr. FARQUHAR.) Is this dockage general in the anthracite region?—A. It is general.

Q. (By Mr. RATCHFORD.) Have you any figures showing the production of any of the anthracite mines per month, and also showing the amount docked during that same time?—A. I have. I will leave it with you. This statement is from a colliery owned by the West Ridge Coal Company, situated in the northern part of the city of Scranton. The colliery is better known by the name of "Pig and Whistle." On this list I find that some miners were docked as many as $7\frac{1}{2}$ cars out of a total of 57 which they had mined in 1 month. It ranges from $1\frac{1}{4}$ to $7\frac{1}{2}$ cars for each miner. That was for the month of April, 1898. On the same list you will find prices that are charged in the company and cash stores, respectively.

(The statement above described is as follows:)

The following is a statement of the number of cars of coal sent out during the month of April, 1898, by the respective miners at the colliery owned by the West Ridge Coal Company, located in the northern part of the city of Scranton, Pa.; also showing the number of cars each miner was docked out of the total mined by him:

Miner No.	Cars sent out.	Cars docked.	Miner No.	Cars sent out.	Cars docked.	Miner No.	Cars sent out.	Cars docked.
1	58	4 $\frac{1}{2}$	21	57	6 $\frac{1}{2}$	38	42	3
2	59	5 $\frac{1}{2}$	22	59	4 $\frac{1}{2}$	40	5	$\frac{1}{2}$
3	49	3 $\frac{1}{2}$	24	28	1 $\frac{1}{4}$	41	75	7 $\frac{1}{2}$
4	43	4 $\frac{1}{2}$	27	62	6 $\frac{1}{2}$	43	60	5 $\frac{1}{2}$
5	47	5 $\frac{1}{2}$	28	9	1 $\frac{1}{2}$	44	76	5 $\frac{1}{2}$
6	67	1 $\frac{1}{2}$	30	21	2	45	40	3 $\frac{1}{2}$
7	40	3 $\frac{1}{2}$	31	33	4 $\frac{1}{2}$	46	77	3 $\frac{1}{2}$
8	57	4 $\frac{1}{2}$	32	30	3 $\frac{1}{2}$	47	58	6
9	57	7 $\frac{1}{2}$	33	53	4 $\frac{1}{2}$	48	70	3 $\frac{1}{2}$
13	62	6 $\frac{1}{2}$	34	40	1 $\frac{1}{4}$			
17	78	4 $\frac{1}{2}$	35	63	6 $\frac{1}{2}$			
19	62	6 $\frac{1}{2}$	36	12	3 $\frac{1}{2}$	Total	1,750	144

The following is a statement of the comparative selling prices of provisions at company and cash stores (Scranton, May 8, 1899):

Provisions.	Com- pany store.	Cash store.	Provisions.	Com- pany store.	Cash store.
Flour per barrel	\$8.50	\$6.50	Cheese per pound	\$0.12 $\frac{1}{2}$	\$0.10
Butter per pound	.25	.19	Sugar 17 pounds	1.00	
Bacon do	.10	.07 $\frac{1}{2}$	Sugar 20 pounds		1.00
Eggs per dozen	.25	12 $\frac{1}{2}$	Raisins per pound	.12 $\frac{1}{2}$.06
Tomatoes per can	.12	.08 $\frac{1}{2}$	Pickles	.10	.08

One of the greatest injustices to the anthracite miner is the dockage system. In regard to time work—in some mines in the anthracite to-day, and particularly so at Maltby, in Luzerne County, owned and operated by the Lehigh Valley Coal Company—they have a system there that is very unfair. They want from 80 to 85 cars per hour to be hoisted and put through their breaker. If this amount is not hoisted the drivers, company men, and the men on the breaker are not paid their full hour; in other words, they are paid according to the amount of coal hoisted, 85 cars per hour being the standard. The men claim they should be paid for every hour while on duty. Sometimes some of the machinery in the breaker breaks down, and they are compelled to stop probably 15 or 20 minutes, or half an hour. That is not their fault. They are there ready to work.

Q. If more than 85 cars per hour be hoisted are those men paid additional wages?—A. No, they are not paid more; but if less is hoisted, then they are paid according to what is hoisted.

Q. (By Mr. PHILLIPS.) What remedy would you prescribe for this dockage system of which you complain? Could operators get pure coal mined if they did not resort to some such method?—A. I think that the coal mined would be equally as good were they not to resort to this, for the reason that I have stated; oftentimes the man that loads the best coal gets the most docking. I tried to load my coal as free from impurities as possible, but I could not escape the watchful eyes of that docking boss.

Q. Would they not be willing to have a judge?—A. They will not grant us the privilege. And further, they have now adopted the double-dockage boss system, having docking bosses also for the inside of the mines, and anything that escapes their eyes will be docked when the cars reach the breaker; and sometimes both do a little docking on the same car, and by the time it gets through their hands the miner has very little left. The remedy for the dockage is this: Have a check docking boss, in other words, a docking boss employed by the miners, on that breaker. That is one remedy, but that I am positive will be stubbornly contested by the anthracite coal operators.

Q. (By Mr. KENNEDY.) Have the miners ever attempted to secure legislation that would aid them?—A. Not that I am aware of. On the other hand, I think legislation for them would be useless, as the operators always have managed to elude, in some way or other, all legislation that has been passed. The only remedy that I know for the anthracite miners is to become thoroughly organized, and then by peaceful methods establish that system. One thing I object to is this: The cars in the anthracite region average from 80 feet to 171 feet, and we think that the miners should have a standard car if the coal is to be mined by measure; and the price should be based on that standard car. They could then operate their mines with cars as big as they liked, while they were willing to pay according to the size; but at the present time they have in the anthracite cars of 80 cubic feet that are being paid for at the rate of 85 cents a car, while at other places they have cars of 161 and 171 cubic feet and they are paying \$1.08 for them.

Q. (By Mr. RATCHFORD.) How are these prices fixed?—A. In 1875 the miners of the anthracite went on a strike against what they termed an unjust reduction. The operators at that time formed a scale of their own, based on the idea that coal should be paid for according to the selling price at tide water. It was placed on a \$5 basis; in other words, when coal sold at tide water at \$5 a ton, the miners received a certain price for mining; and they also received 1 cent advance on every 10 cents per ton that the price of coal advanced, and a reduction of one-tenth of any fall in the price of coal. The miners never signed that scale, so that it was a one-sided affair; and at the present time the operators claim that they pay the miner according to this basis of 1875, and through the unorganized condition of the miners they have been able to secure reductions in the price of mining in different places, and that accounts for the marked difference in the price of mining in the different places to-day. They have never offered them a reduction as a whole since that time, but have always reduced them one section at a time, or, in some instances, one or two collieries at a time.

Q. If the operators receive 90 per cent on every advance in prices, as compared with 10 per cent received by the miners, can you explain why it is that the operators oppose an advance in wages?—A. The only reason I can give is that it would take dollars out of their pockets, of which they are so fond.

Q. It seems that it would put money in their pockets instead of taking it out to grant miners an advance?—A. I can not see it that way for the reason that the miner has not for many years past been accorded the privilege of being present and seeing that he was getting what really belonged to him; in other words, the coal operators fix the price and the miners have nothing to do with it. The coal operators take all the advance at present and the miner does not get his share. Even when the price of coal does advance the miners do not receive an advance.

Q. Then that sliding scale is not being carried out?—A. The sliding scale has not been carried out. It has slid the one way; it works splendidly the one way, but it never works the other. That sliding scale was only in force in what is known as the Lehigh and Schuylkill regions; in short, the ranks of the miners have been demoralized for several years past; they were not organized, and the prices that prevail at present were forced upon them because of their unorganized condition.

Q. Is it true that the prices of anthracite coal are regulated by a corporation or combination of coal operators?—A. It is; a combination known as the "Anthracite Coal Operators' Association."

Q. The regulation of those prices takes place at a certain period in the year, for the production of the season, does it not?—A. It does; stating the amount that shall be mined for that period and the price which that coal shall be sold at in the market.

Q. Have you had any instances in which the selling price of that coal was higher at one time than another, under this association's rules, and wages lower during the period in which the product was selling at the highest price?—A. You will find that coal sold this past winter at a much higher rate sometimes than it did at others, and while the miners were not reduced, yet they did not receive any advance as they should have. I do not regard this sliding scale as in operation at all to-day in the anthracite region; in fact, it was never signed either by the miners or by any representative of the miners.

Q. When was this last anthracite coal combination formed?—A. I can not state now positively.

Q. Is it true that wages in the anthracite region prior to the formation of this coal combination were higher than they were the following season after the combination was formed, even though the product was sold higher during the latter period?—A. I am not prepared to furnish definite information on that; but I will say that the wages of the anthracite miners and all those employed in and around anthracite mines have been greatly reduced in the last few years, until at the present time the wages paid are lower than they have been for many years.

Q. (By Mr. FARQUHAR.) How long have you known of the existence of this association—13 or 14 years?—A. My time as a miner in the anthracite region has not been that long. To my own personal knowledge as a miner, 6 years. Previous to that time I was a laborer, and perhaps did not pay the attention to these things that I should.

Q. Of your own knowledge of the mine workers in the anthracite region, as to intelligence, honesty, and peaceful disposition, do you think that they can properly organize unions and gain in strength to rectify the abuses that you speak of?—A. As to the intelligence of the anthracite miners, I have no doubt; in fact, I know that they are intelligent enough to carry this matter out; and the foreign-speaking people in the anthracite region are very anxious to become affiliated with the organization of their craft at the present time, more so than they have ever been; and I firmly impressed upon all of them the necessity of dealing with all questions in a lawful manner, and I have no doubt but what the Wyoming and Lackawanna valleys, in particular, will be able in the future to have many of the wrongs which they are now laboring under redressed through their organization. All that we ask is that we be given the protection that should be given to every peaceable American citizen in the work of organizing.

Q. In other words, you do not want to organize for strikes, but for fair play between operators and the mine workers?—A. Yes; to further those principles which are set forth in our constitution—conciliation and arbitration.

As to store orders, I will say that a great many of the anthracite coal operators run company stores in connection with their collieries, and while I have never been told that I would have to buy in these company stores, yet many of the miners have told me recently that they were compelled to and that the superintendents have told them to buy in the store.

Q. (By Mr. KENNEDY.) Is not powder sold in the company stores?—A. I mean living provisions. Some of the company stores are such that you can get almost anything from a paper of pins to a steam engine.

Q. (By Mr. RATCHFORD.) Is the powder usually held in a magazine by the mine?—A. It is held in a magazine; they generally have it to hold picks, shovels, and all such things.

Q. It is part of their system—selling the necessities of life and working utensils to miners?—A. Yes; but they are kept in a separate place; those things are kept separate on a miner's check. One remarkable feature about some of the miners' checks is that when they would have 20, 30, or 40 cents left after paying the store bill the company would always manage to claim that much for blacksmithing, so that the miners would draw a blank. I have some checks here I will leave with

you, but I would not wish to have the miners' names mentioned, for were they to be mentioned in this report I am satisfied that those miners would leave the anthracite coal field. Here we have one where the miner earns \$24 and they manage to bring things out to the exact cent. I promised the miners their names would not be used. Some of them are very poor men; in fact, all are, and if they would be thrown out of employment they would not have car fare to go any place else. There are a few with larger amounts than these, but there the miner has to pay the man who works for him, or, in other words, pay his laborer out of that amount. That accounts for it being larger. In connection with this I have one more thing to leave with you, if you would wish it—a company store book, showing the account of a miner, name, and place of residence. If the commission wishes it, here is an account of the prices charged in the company stores and the prices of provisions in the cash stores at the same time. That was published and was never contradicted, and, in fact, is genuine.

Q. You can not give us any authority for it?—A. The *Scrantonian*, a newspaper of Scranton, published that, and they gave me the privilege of using their name as being the authors of it. I have another account, which I will hand to you here, or a company store bill of \$23.29, and the prices that prevailed in the cash store at the same time for the same goods, which shows a difference in favor of the cash store of \$6.72 in that bill.

Q. (By Mr. KENNEDY.) What is the percentage of difference?—A. It will be about 27 per cent, as near as I can tell just now without figuring it closely.

Q. (By Mr. RATCHFORD.) What is the name of the store?—A. That is the Parrish Coal Company's store.

Q. What is the name of the cash store?—A. They were the prices prevailing in the cash stores at that time; not any particular store.

They have a law on the statute books of Pennsylvania which says that they shall not run company stores in connection with collieries, but they appear to do this in defiance of the law. The law, however, has been declared unconstitutional; but they do at the present time, to a certain extent, compel the miners to deal in their stores. In fact, the gentleman that was to have been here to-day has a company store, and the miners at that place are told plainly that they must deal in that company store. The remedy for that I do not know, unless a law could be passed in the State of Pennsylvania which could not be declared unconstitutional; or organize thoroughly, and so compel the coal operators to close those company stores. Congressman Morgan B. Williams did close his store at the time that law was passed, and to-day he does not run any store in connection with his colliery; that is, grocery and provision store. He does, like all other operators, sell powder and supplies to the employees; but he is one of the fairest operators to the miners and to his employees in general that there is in the whole anthracite coal field.

The difference in wage schedules in the different sections—I can leave some here with you, which gives the prices paid for all kinds of labor at 18 or 20 collieries in the Lehigh region; also some from the Wyoming Valley and Lackawanna Valley, showing the different rates of wages paid. In the Lehigh region outside labor on the average is paid \$1.10 per day. That may be above the average. In the Wyoming Valley the average I will place at \$1.35 per day for the same kind of work, a difference of at least 25 cents per day between those two adjoining sections. There are drivers in the mines at Providence, Pa., working 10 hours for 87 cents.

Q. (By Mr. A. L. HARRIS.) Is there any difference in the coal of the mines?—A. I have mined in several places and I do not consider that there is a great deal of difference in the mining. The most of the difference is this, that in the Lehigh region the veins nearly all pitch somewhat, and in some places they have a very rapid pitch—in fact, almost perpendicular—while in the Wyoming Valley the veins are level, or nearly so. The mining is harder on that account in the Lehigh than it is in the Wyoming.

The influence of organized labor on wages—I will say in regard to that that at the time there was an organization in the anthracite better wages prevailed; the men had better terms and conditions of employment than at the present time. Where I worked last, Jeanesville, the conditions of employment were much better after the men became organized than they were prior to that time. In fact, to work there 2 years ago and to work there in that same mine 1 year ago, or since that time, a person would scarcely think he was working for the same company or under the same foreman, the change was that great. That is as far as my personal knowledge has gone on the influence of organized labor on wages, except in a general way, speaking of our organization, which I suppose has been covered by the other witnesses.

The number of employees in the anthracite is fully as great to-day as ever were. There are more men in the anthracite then can find employment. There are a great many idle all the time, and it has a tendency to keep wages down below what they should be.

Q. (By Mr. KENNEDY.) Was not that surplus of labor brought about by the operators importing the foreign labor under contract?—A. It was. Prior to that time all men wishing work could find employment. The only way that I know of to remedy this is to adopt the 8-hour workday, if possible, to give employment to a greater number of men. I know of no other way to give work to the unemployed.

There are thousands of very young boys employed in the mines in the anthracite as door boys, and in the breakers. There are many employed who are compelled to work by reason of their fathers not being able to support the family; and in other cases you will find many working who are the sons of widows, and who are compelled to work in order to help support the family. The law in Pennsylvania states that no one shall be employed in the mines under the age of 14 years. I have no doubt but what many are employed under 14 years.

Q. Do you know of any instances?—A. I have seen many who, I am almost positive, were under 14 years.

Q. Then, that is the parents conniving at the violation of the law; the parents are at fault as much as the mine owners?—A. At the breakers many boys are employed under the age at which the law says they shall not be employed—that is, 12 years; but I do not know how we can remedy that, because the boys certainly apply for employment and are given the employment.

Causes of irregularity of employment—I will name one cause why the men are not employed more regularly: the output is so much larger than the consumption. That accounts for the irregularity of employment to a certain extent. The anthracite mines are capable of producing, according to the best reports that can be obtained, about 70,000,000 tons of coal in a year, while the output so far has not exceeded 47,000,000 tons in any one year. The average time that the anthracite mines work we might place at 150 days in 1 year. The shorter workday we claim would give employment to many of those men that are now unemployed; and not only that, it would give both the men and boys employed a better chance to educate themselves, more time to spend with their families and in the enjoyment of life, and the educational feature, the one I just mentioned, above all. Many boys who go to work at a very early age can not devote the time to education which they should, and which they would were the mines to work 8 hours instead of 10; and we find the anthracite mines work in many instances over 10 hours per day. I have been told myself, when I would be going out of the mines in the evening, that unless I stayed in and worked until 7 o'clock I need not go to work the next day.

Q. (By Mr. RATCHFORD.) Told by whom?—A. I was told this in Jeanesville by the mine foreman at that place. In the winter of 1896 I was working in what is known as the Number 4 slope at Jeanesville.

The effect of immigration on employment in the anthracite is this: It has reduced wages and has caused a surplus of labor which enables the operator to enforce conditions upon the miners and upon the workmen to-day which they could not enforce upon them did this surplus of labor not exist.

Q. Are the miners in that region—English-speaking and people speaking other languages—in favor of limiting the immigration?—A. The English-speaking people are. The foreign-speaking people I have not approached on that subject, for the reason that the majority of them are not far enough advanced to speak intelligently on that subject. While there are some, yet there is only a small percentage of them able to discuss that question intelligently.

Q. Are most of the English-speaking people in the anthracite region, to whom you refer as in opposition to immigration, of foreign birth?—A. The majority of them are of foreign birth. A great number of them are of foreign birth, while there are thousands that are born of foreign parents.

Q. Yet they all unite on that one point.—A. That there should be some restriction on immigration.

Q. (By Mr. FARQUHAR.) Is there any colored labor in the anthracite region?—A. There is not that I am aware of. I have never seen a colored man in the anthracite working in a mine.

Q. (By Mr. RATCHFORD.) How is your public-school system?—A. Very good in all the schools in the anthracite that I have any knowledge of.

Q. Well adapted to the needs of the working people?—A. If any child is kept in the public school there until he has gone through their branches of study, he will have a very good education, and such that will fit him for all ordinary purposes.

Q. (By Mr. KENNEDY.) Does the State furnish educational facilities in foreign tongues?—A. They do not.

Q. (By Mr. FARQUHAR.) Have you free text-books in Pennsylvania?—A. Yes.

Q. Have you anything to say under the head of labor-saving machinery, or mining machinery?—A. In the breaker they have modern machinery which does away with a great amount of labor, and particularly in preparing the coal. They have machinery in the anthracite that will clean the coal and prepare it for market, where the breaker boys formerly had to do this work. It displaces a great number of boys, and men in many cases.

Q. Do you regard that as being a good thing for the boys?—A. It throws a great many boys out of employment that are old enough to work, and who will have to go into the mines or at some other employment, for the reason that their parents are not able to maintain the family without their help. In the mines we are not troubled with very much machinery, as it can not be used to any great advantage in anthracite coal. The anthracite coal is of such a hard nature that no machine other than a drilling machine can be used; and the miners all have those drilling machines.

As to giving definite information, I do not think that I can to any extent. I will say, however, that this last combination that was formed, with J. Pierpont Morgan at the head, is believed by all to have been formed for the purpose of preventing those individual operators from constructing their own coal road to market. Simpson and Watkins were the leaders in the project of that new coal road which they proposed to build from the Wyoming Valley to tide water. They have been bought out by this combination, so that the idea of building that new road has been abandoned. That is all I have to say in connection with combinations. They undoubtedly charge extortionate rates for taking the coal from the anthracite mines to the markets. I have a few prices here which have been procured from an anthracite-coal operator which I will submit: The rate from Hazleton to Allentown, 52 miles, is \$1.10 per ton. From the same point to Bethlehem, Pa., 57 miles, it is \$1.15 per ton, and from the same point to Philadelphia, 114 miles, it is \$1.55 per ton.

Q. (By Mr. KENNEDY.) Can you state what it is to New York?—A. I could not get that rate. That is guarded so closely that I have not been able to get that information; but it is generally understood that the price charged by the carrying companies from the mines to tide water is two-fifths, or 40 per cent, of the selling price of coal. The carrying companies take that and the operators get 60 per cent for their product. That is as far as I can go on that, to state facts.

We have mine laws in Pennsylvania which appear to be all that they could be. Yet, at the same time, those laws are not carried out. I may, perhaps, have to get very plain on that question, but as I am here for that purpose and to state facts I shall. We have a mine law in Pennsylvania which says that the air shall be carried to the working face of each place in sufficient quantities to sweep away and render harmless all gases, powder smoke, etc. It is not done. I am stating what I know to be facts. Some time in 1897, or probably in the beginning of 1898, the workmen at Eckley, Pa.—a portion of the district that I was then working in—brought this matter before our district convention. The mine inspector was notified to go to that mine and inspect the air in those places. He went there. All places where union labor was employed were stopped and the places where nonunion labor was employed were allowed to work. That I know to be a fact.

Q. (By Mr. FARQUHAR.) You concede, at the same time, you have good laws if they were enforced properly?—A. The laws are good if they were enforced.

Q. (By Mr. RATCHFORD.) What means do you suggest of enforcing the laws?—A. At the present time it is necessary, if I am not mistaken, that 15 or more miners shall make a complaint before any charges can be made against a mine inspector, and I think that is not just. I think that if any one man in that mine will say that the air in his particular working place is not what it should be, that the mine inspector should at once visit that portion and cause better air to be circulated, and, failing in this, that that miner could report that mine inspector to the proper authorities, and that there should not be 15 miners required.

Q. (By Mr. FARQUHAR.) Do you think there is a sufficiency of mine inspectors there to properly inspect the mines?—A. I think not; and those that are there do not do their duty.

Q. (By Mr. KENNEDY.) How often did you say the inspectors came down during your time?—A. I would see the mine inspector very seldom, in fact, scarcely ever unless an accident occurred; and I have been told by miners in different sections of the anthracite lately that they never see the mine inspector unless one of the employees in the mines is killed.

Q. (By Mr. RATCHFORD.) Do you believe that those laws can be enforced to a very great extent by a more thorough organization of your workmen, in which and through which the discussion of those questions can be had at open meetings, etc.?—A. I really think that the solution of that question, or the best results, would follow the organizing of the miners. If it is possible to effect a thorough organization among them, I have no doubt but what those evils can be remedied, at least to a great extent. The local meetings take the place of a school; in other words, the men meet to educate each other as to our needs and to the proper way of adjusting differences and remedying evils. I have worked in the anthracite mines within the past year where I could not work a full day at any one time, the air was so impure; and the current of air was not sufficient to drive away the smoke, so that I would be compelled to leave my work at 6 or 7 hours, and then would not be in a fit condition to walk home many times.

As regards the law regulating payments: I have my checks here for the past year which I will leave for you, and you can use them as you choose, with permission to use my name, as I do not care.

You will understand that the miners of the Lackawanna and Wyoming are compelled to put a certain amount of topping on their cars, such as they do in the bituminous, and the operators demand more topping on their cars now than they did a short time ago. In mines where they were paid a certain price for a car with 6 inches of topping they are now compelled to put 10, 14, and in some instances as high as 18 inches on that same car for the same price.

Q. (By Mr. A. L. HARRIS.) On the freight car?—A. On the mine car.

Q. (By Mr. RATCHFORD.) You have worked every day that you had an opportunity?—A. I did, and worked a great many days that the mine did not work.

I know the needs of anthracite miners as perhaps few know them. I have seen within the last 2 years, in the winter time, children without shoes to put on their feet—could not go to school, could not go out of the house—and at the same time they have been refused a pair of shoes out of those very company stores that I have mentioned. I have known families in the past year to do without meat for a month at a time; that did not know what it was to have meat. And I have known cases where families did not have the bread to give their children on their rising from their beds in the morning.

STATE OF PENNSYLVANIA, *County of Luzerne*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

BENJAMIN JAMES.

Sworn and subscribed before me this 14th day of August, 1899.

J. F. DONAHUE, J. P.,
Third Ward, Wilkesbarre, Pa.

Certificate on file in Pension Department, Washington.

WASHINGTON, D. C., May 10, 1899.

TESTIMONY OF MR. R. G. BROOKS,

Coal operator, Scranton, Pa.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. Mr. R. G. Brooks testified. The topical plan of inquiry on mining was followed in the examination of the witness.

Q. (By Mr. RATCHFORD.) Please give the title of your company and place of business.—A. I am connected with three or four companies. One is located about 3 miles south of Scranton—Greenwood Coal Company; I am president of that company. The next one is down about 5 miles below that, south again toward Wilkesbarre, called the Langcliff Coal Company; I am president of that also. Then down about 8 miles below that we have what is called the Laffin Coal Company; I am president of that also. We also have a system of washers called Brooks's Coal Company. We have only two ready, but four contemplated; that is, washing dumps in connection with the colliery.

Q. Are those companies to which you refer separate and independent of each other?—A. Yes.

Q. Is there any form of organization between the coal operators of the district in which these mines are located?—A. No; there is no particular form of organization except what is known as the Anthracite Coal Operators' Association. It is simply an organization which comes together every 3 months to discuss the situation of the coal trade generally and keep posted as to the statistics from time to time.

Q. Does this association regulate the selling prices, reduction, or anything of that kind?—A. Has nothing to do with that.

Q. Wages?—A. Well, by the general custom in that region we are governed by adjoining corporations, railroad companies. The Lehigh Valley is one of our largest competitors.

Q. Is there not an organization among the operators of your district known as the Anthracite Coal Trust, or is it a railway?—A. That is composed of railways operating coal mines. The coal operators are separate and distinct. It is composed only of those interested in the railroad and coal companies jointly, and we are really in their hands; that is to say, most of us are under contract called the 60 per cent contract—60 per cent of tide-water prices; pea coal, 45 per cent of tide-water prices.

Q. This contract you refer to is a contract made with the companies?—A. Yes.

Q. Your product is all sold to them?—A. Nearly all. Of course occasionally we sell a few cars outside.

Q. They market it?—A. They market what they take under these contracts.

Q. And the producers get 60 per cent?—A. Yes; 60, 45, and 32 per cent, respectively, of tide-water prices.

Q. Is there more than one carrying company with whom these contracts are made by operators of your field?—A. Yes; I think eleven.

Q. (By Mr. PHILLIPS.) Can you give the names?—A. Of course they have been consolidated. I could give the names as we used to know them; for instance, used to be the Delaware, Lackawanna and Western, Pennsylvania Railroad Company, Delaware and Hudson Canal Company, Philadelphia and Reading, Lehigh Valley Coal Company, Central Railroad of New Jersey, Pennsylvania Coal Company, Erie Railroad Company, New York, Ontario and Western Railroad Company, New York, Susquehanna and Western.

Q. Do they have an agreement among themselves, that is, the railroads, to allow each one a certain per cent of this carrying to the trade?—A. As nearly as I can judge. Of course, we, as operators, do not get into that circle. We sell the coal to them at the colliery. The railroad companies govern that themselves. There was an understanding by which, a few years ago, they allowed to each one of those interested a given per cent of the trade, and that was based upon what they had been in the habit of placing on the markets the previous year or two.

Q. Are they now or have they ever been competing with each other in regard to carrying?—A. Only at odd times. They always complained that the other fellow was not living up to the per cent allotted, etc.

Q. (By Mr. RATCHFORD.) Do you understand that these carrying companies have any mutual association by which prices of transportation and the price to the operators are regulated?—A. Well, I can not say as to uniform organization, but there apparently is an understanding.

Q. Where is the general market for this coal?—A. Most of it in New York City, though some in New York State; considerable in Philadelphia, Baltimore, and often at Washington.

Q. Is this method of disposing of your product to the railroad companies a matter of voluntary action on the part of the coal-mine operators, or is it brought about by force of circumstances?—A. When that contract on the basis of 60, 45, and 32 per cent was first brought about a few years ago, it was considered a very fair deal, as most every operator would prefer to sell to one man rather than to carry it all over the country, or, rather, trade in the different markets. In that way they take upon themselves to furnish cars; they put them in and sell the coal and pay us our money, whereas we would have to have several agents if we sold it ourselves.

Q. Is that plan equally acceptable to the operators to-day?—A. It is not.

Q. (By Mr. PHILLIPS.) Do you regulate the output of the various mine owners?—A. We do not regulate it.

Q. Each company is allowed by this railroad combination a certain per cent of its capacity?—A. Yes. These companies have an understanding that each railroad company shall carry a certain per cent. There is an agreement upon a certain allotment; the Delaware, Lackawanna and Western was allowed 13.35; the Pennsylvania Railroad Co., 11.40; Philadelphia and Reading, 20.50; Delaware and Hudson Canal, 9.60; Lehigh Valley, 15.65; Central Railroad of New Jersey, 11.70;

Erie Railroad, 4.00; Pennsylvania Coal Company, 4.00; and New York, Ontario and Western, 3.10; the Cox interest, 3.50; the New York, Susquehanna and Western, 3.20. Those were the understandings between them, and they try to live up to them. In proportion to the number of collieries, they fixed the number of cars to be distributed, and we have but very little to do about it.

Q. Is there any discrimination noticed in the distribution of cars?—A. Well, yes; in this way: The great trouble in the anthracite region, which I regard as the key to the whole situation, is the policy adopted by carrying companies without considering the welfare of the employees. They had a great time in talking and adjusting the percentages. It took them a year to get at those figures. They have never been satisfactory. These percentages are not equitable. Some of the collieries make as high as 250 days a year, while others make 100 days. The great trouble in that is this: The employees who make 100 days will go to work where they can make 250, and the result is the men are constantly changing. These are small companies, and they can not help themselves. For instance, we had a colliery last year that made 100 days, while right adjoining us there was a colliery that made 220 days.

Q. You believe that is due to an unjust rating as to the amount of their capacity?—A. Yes. For instance, the Delaware and Hudson rating, 9.60, should not have been over 8 per cent.

Q. Who does this rating?—A. Individuals connected with these companies, generally the vice-presidents of the carrying companies. As to the remedy for that, I think we have always argued that matter from the tonnage. The market takes about forty-five million, and the producing capacity is about sixty-five million of anthracite coal. I hold there is but one way to adjust that—let the tonnage take care of itself, and let the employees of the anthracite region make about the same number of working days. Then the employees will be satisfied, and the operators will be satisfied. The percentage, I think, should be based on the working days. The average number of working days last year was 142. But some collieries make 100 days, and some do not make over 90, while some others are allowed to make over 200.

Q. (By Mr. FARQUHAR.) Do all those eleven transportation companies own mines?—A. Well, yes; but not under that exact name.

Q. Granted that nine-tenths of these companies own their own mines; you outside operators must take what is left of this pro rata?—A. Well, no. Suppose I give you an illustration of what I mean: We will say the Delaware, Lackawanna and Western, Lehigh Valley, and Philadelphia and Reading companies get together; they can control the situation. The New York, Susquehanna and Western get $3\frac{1}{2}$ or 4 per cent, you know. The Lehigh Valley takes 15.56. I am not prepared to say what the percentage should be. The ground I take all the time is that I do not care anything about the percentage; but the employees of the anthracite should work just the same time, or about that. I think justice demands the employees ought to be considered in preference to the corporation. It keeps them all satisfied; they are generally satisfied if they are working just the same time. They can not get full time; it is utterly impossible in the anthracite region. I think the only way to restrict is to allow the employees to work the same time. Instead of taking tons, take days. The original understanding was based upon what they had been mining for the past couple of years, and that was what these percentages were figured out from. If placed on the time they make, and it was understood among the employees that we divide the time, the tonnage will take care of itself.

Q. Are you prepared to say that it is unfair toward the mine workers themselves and just as unfair to the independent operators and the smaller carrying companies who own coal mines likewise?—A. I am prepared to say this, that the situation to-day stands in the hands of four or five companies. Take the Delaware, Lackawanna and Western, the Lehigh Valley, Reading, and Central of New Jersey—they control the situation; give the cars as they please. My recollection is that the Delaware, Lackawanna and Western averaged over 200 days last year, while the average of the anthracite region was 142 days.

Q. (By Mr. RATCHFORD.) You stated, I believe, that the coal companies who are separate from the railroad companies are obliged to take what was left in the way of cars. Now, in this you have large and small companies; do you find that the larger companies in any case get preference over the smaller ones from railroad companies that are not connected with them directly?—A. Really, there are so few that are not in one or the other of those allotments; for instance, we send 200,000 tons a year to the New York, Susquehanna and Western. Even though we control no trade, we are considered in that allotment, and the result is our companies get cars according to the percentage allotted to that road over which coal is shipped.

Q. Is there much variation in the producing capacity of a miner in the anthracite region?—A. Yes; there is a great difference in the producing capacity of a miner, particularly when you take the number of laboring days. Some people can do in 6 or 7 hours what others can do in 9.

Q. If it be true that there is not much variation in the nature of the coal veins, then, if there was a proper rating as to the capacity of your mines, I mean an equitable rating as between all operators concerned, it would lead to the same results, or practically the same, as if the distribution were made by days of work, would it not?—A. Yes, it would, and would not. You can change the days of work, whether you make it 8 or 10 hours. I would rather see them cut everything to 8. As a matter of fact, 8 hours is a big day's work in the mine. I am not much in favor of 10 hours for miners and laborers.

Q. Are you of that firm belief?—A. I am, honestly; and there is another thing: No matter what the adjustment is in the percentage principle, you see that can not continue forever, because men make changes. Our breaker will have a capacity of 100,000 this year. I am going to put 200,000 through next year, but in the meantime there is no rerating. It is simply a question of plain counting.

Q. Under the system of rating by percentage there is no incentive to increase the capacity of your mine; in fact, if the capacity falls off you get an additional number of days' work.—A. Yes.

Q. Have you had any instance in your region in which a coal company stayed out and refused to sell to the railroad company at the prices fixed?—A. We have not, until here lately. They take the coal; we do not refuse to sell it to them, but refuse absolutely to renew all contracts run out. In this case we refused absolutely to renew contracts under the old basis, simply because it is so unjust in this light. We find, at the rates bituminous coal has been hauled in there, and all over, and at the rate charged us for anthracite as compared with bituminous coal, that we can not live unless we come down in price to compete with it, while the railroad companies might live. Now, the advantage on the part of the owners of a railroad is that we simply get a profit at the mine, if there is any, while if railroads do not make anything there they do on carting it, for the price for carrying anthracite coal is about 10 mills per mile, while the average rate for bituminous coal is in the neighborhood of $2\frac{1}{2}$ mills. That is one of the leading troubles in the anthracite region. If they carry anthracite coal, we can not see why they can not carry it for the same price that bituminous is hauled. It ought to be the same.

Q. If the operators in your region who have coal to market should send their coal and pay the railroad companies their price for transporting it, what would be the result?—A. Of course they probably would furnish you cars, though we have instances where we have ordered cars, I guess 2 years ago, and they simply make a polite reply that they have no cars. Take, for instance, the Delaware and Hudson; we have ordered cars time and again, and our collieries are connected with their tracks. I do not think we have had 10 cars in 2 years. We must sell at what we can get.

Q. The operators of mining properties along these lines have no alternative but to allow railroad companies to dispose of their product?—A. That is about the essence of it.

Q. Does the man who invests his money in mining property, and digs the coal to the surface and loads it on a railroad car, have any say as to what it shall be sold to the consumer for, or do the carrying companies fix the price to the consumer?—A. They do; for instance, you saw in the paper yesterday where they regulated the prices for May.

Q. You get 60 per cent?—A. Of whatever they agreed upon. We have to take their word for that.

Q. That being the case, is it or is it not a fact that the coal producer of the anthracite region, who is obliged to deal with such surroundings, is simply the crushing power between the railroad company and the miner?—A. Yes; I understand, I think, what you mean, and I would reply to that something like this: We are between two millstones. Men who are engaged in the business can not see. It is impossible for them to conceive how some collieries right there are making so much more time than we are making. That is the great trouble. The result is they are full of employees all the time. If there is a scarcity of employees, it is with the individuals who can not give as much time.

Q. (By Mr. PHILLIPS.) You said the railroads made a price for the month of May just lately. How do you know the price they obtain for that; do they make you a written statement?—A. They make us a written statement. In some contracts there are provisions by which, if you desire it, you can get the president to swear to it, but that clause is in but very few. It does not make any difference.

Q. (By Mr. FARQUHAR.) Even if you knew you would have no remedy.—A. That is the point; we have no remedy; and the moment we get in a quarrel with them we strain the situation.

Q. (By Mr. RATCHFORD.) Does the price for which your coal is sold to the consumers by the companies who carry it from the mine to the market determine the price to be paid for mining it?—A. Yes; due to the fact that we in turn are governed by what they pay for mining, and they govern that themselves, so we are right in their hands all the time. Suppose we attempted to run a rate scale 5 per cent below them, of course we would expect that our men would strike at once. That is a policy that is carried out in all regions there. We follow and agree to pay about the same as the Delaware, Lackawanna and Western and Lehigh Valley; whatever they pay we feel satisfied, whether we make or break by it.

Q. (By Representative OTJEN.) I understand that these railroad companies that own their own mines, work their mines more days than mines are worked which are owned by other people?—A. They do; and under what they consider a fair adjustment of capacity. We had two collieries placed on a certain line—Delaware and Hudson—connected with the Delaware, Lackawanna, and Western; now these companies understand each other. We made at these two collieries 108 days, while the Delaware and Hudson collieries averaged a little over, I think, 200.

Q. Nearly double?—A. They fixed the percentage, and, as I say, they get the great majority in the division of cars.

Q. You think it impracticable to allow mines to run their full capacity?—A. Yes.

Q. There is not sufficient consumption?—A. I think the market took about 43,000,000 tons. I am inclined to think it may take a little over 45,000,000 this year. About one-third of the coal-producing properties or companies engaged in the anthracite business in the State are in the same situation as ourselves.

Q. And the other two-thirds are connected with the railroads?—A. Yes.

Q. (By Mr. FARQUHAR.) You mention that the average working days in the anthracite region last year was 142 days?—A. That is what it actually was, counting all the mines in the anthracite region—a total of 374.

Q. Can you give the average wages of the mine workers?—A. Yes. Six cars is supposed to be a day's work. That is the allotment. They have agreed upon that.

Q. (By Mr. PHILLIPS.) State how much is held by the cars that are used in the mines.—A. They will run from 1½ to 2 tons; they differ in size in different collieries, and that has been in vogue for, I suppose, 30 years. Finally, the men agreed among themselves in the Wyoming and Lackawanna regions that they would not load over 6 cars.

Q. (By Mr. RATCHFORD.) Are they paid by the ton or car?—A. Both. In our case we pay them by the car. They are paid both ways.

Q. What is the ruling price by the car?—A. Well, those cars range, I would say, from 75 cents to \$1.20; that is, running from 1½ to 2 tons. Of course, very much depends on the nature of the vein. For mining in a 4-foot vein we have to pay a little more than for mining in a thicker vein, with less impurities.

Q. The average wages of miners in your district—the day's work is 6 cars; the fellow who helps gets one-third; suppose this is \$1 a car; he will get \$2, and the other fellow gets \$4, and he buys all tools and supplies out of that; so that while the laborer is making \$3 the miner is supposed to make about \$2.50 or pretty close to that?—A. Of course, you have to take the general average to get at it, for different mines differ in price. It is very hard. In some places it is contract labor; some places day work, and in some places instead of working days full time they work 5 or 6 hours; so you can reduce it in proportion. That is a great drawback. Failure to bring about full time should be adjusted so that employees of the anthracite region, about 150,000, should be considered in the adjustment of the conditions of the coal trade, and if they all worked about the same time, even for only 142 instead of 200 and 250 days, they would be much better satisfied with their condition.

Q. You have said that the transportation companies fix a price to the consumer.—A. Fix the price to the consumer. There are individual operators who are shipping where there are two or three mines connected with a particular road, and putting the coal on the market. You can hardly say coal companies fix the price—indirectly they do.

Q. (By Representative OTJEN.) Substantially?—A. Yes.

Q. (By Mr. FARQUHAR.) When the independent operator sends his product to the market by one of the railroads of the mining combination, is the competition in the market conciliatory between the two, or does the independent operator, by

force, have to sell at the rates laid down?—A. Yes, they must; due to the fact that the capacity of production is 20,000,000 tons more than the demand of the market.

Q. (By Mr. RATCHFORD.) Does the variation in market prices affect the cost of transportation?—A. Transportation has been the same for years.

Q. If the transportation company practically fixes the price to the consumer and always receives 10 mills per mile for transportation, is there or not an incentive on their part to keep the mines running, though they know they are disposing of the product at ruinous prices?—A. Exactly; that is correct. They carry, say, thirty million. Suppose they lose \$1,000,000 this year on coal mines; if they make four or five million on their roads through keeping up their rate, they can afford it. They would be the gainer. The great trouble, as we see it, is this: that it is constantly curtailing the market for anthracite coal, due to the fact that they can not get \$5 for coal as we did, years ago, since bituminous increased to such an extent.

Q. (By Mr. FARQUHAR.) Is it a fact that these large transportation companies own and control both the rail and water transportation?—A. Well, they do in this way, that we have no method of getting it to the water except over these lines; hence they control the whole situation.

Q. Do not they own their own line of carriers?—A. They do, largely.

Q. (By Representative OTJEN.) Has this question ever been called to the attention of the Interstate Commerce Commission, the fact that the railroads charge for one coal a higher price than for another?—A. Yes, but they claimed they had not the power to regulate it; that they need more power in order to regulate freight rates. Cox Bros. & Co. sued the Lehigh Valley. The commission said, calling the case up, that while it had power to say when a rate was excessive, and it could name a rate that was reasonable, it had not the power to enforce it; so the result of the suit was placing Cox Bros. & Co. where they were before.

Q. (By Mr. KENNEDY.) It seems from your testimony that the independent producers, constituting one-third, to which class you belong, are almost entirely at the mercy of the two-thirds who have connection with the transportation companies. Is that so?—A. Yes.

Q. Then, why do they permit any of your coal to go to the market?—A. The only reason I can assign is that that would be too flagrant a violation of decency; that could not stand.

Q. They have it in their power to do that?—A. Yes, except a greater power steps in under such a radical situation and helps us.

Q. You mean Government control?—A. The Interstate Commerce Commission should be given power sufficient to regulate these things.

Q. (By Representative OTJEN.) I suppose you would be entitled to cars, and the question would be whether the railroads were able to furnish the cars?—A. Well, you could go along the lines and find thousands of cars resting in different freight yards; we ask them for cars and they will write us that they are short of cars just now.

Q. (By Mr. RATCHFORD.) What has been your experience in regard to railroad companies justifying themselves in discriminating against any operator by refusing him cars?—A. I do not know, ordinarily, what to say to that; of course, it is nothing more or less than, "We have the whip and we will use it to the extent we think best in our own interests."

Q. Can they always advance reasons rather difficult to disprove?—A. Oh, yes. Of course, there is very little honor among those larger companies. They want to regulate and will regulate this product. Of course, they avoid and evade the truth very often in order to avoid getting in trouble, you know. But we know, through experience, about how these things go. We are simply in the hands of the coal-carrying companies who have large interests in coal mines. If we go into a fight with them the first thing you know they knock down coal half a dollar a ton. Suppose they lose \$100,000 in a fight, you never see them knock down rates on railroads.

Q. (By Mr. FARQUHAR.) Freights have never changed?—A. It is in their power, in other words, to run their coal mines at a loss and make a magnificent profit on their railroads; and that will close every one of the independent operators. You see the situation. It is in the power of these coal-carrying companies who own coal mines and railroads, which carry coal to the tide as well as to the lakes, to close up every independent operator in this way. They can so reduce the profits on coal and keep up freight rates that they can lose the profit on their coal and yet make a magnificent profit on their roads. That is the situation. It is due to excessive freight rates.

Q. (By Mr. RATCHFORD.) Do you believe that it is an injury to the coal trade

from every standpoint, excepting, of course, that of those who are directly profiting by it, to have coal mines owned and operated by railroad companies?—A. Yes; it is detrimental to the best interests to have a railroad having a large interest in coal mines and, through that railroad, controlling the situation. Those railroads control the anthracite region absolutely.

Q. (By Mr. KENNEDY.) This power, then, which you are speaking about, has been so absolute that it has enabled them to gather in the coal mines in the different regions there at a comparatively small figure?—A. Yes, they have bought very low. Take the Philadelphia and Reading, for instance, and the Delaware, Lackawanna and Western. The Reading, for instance, owns about 90,000 acres, I should say, of coal territory. Every foot of it does not carry coal, but it is in the coal fields and was bought for coal lands and bought very cheaply. Now they are operating on from 15,000 to 20,000 acres. Of course they pay a royalty on all the rest—on the unmined coal. That means hundreds and hundreds of thousands of dollars paid in advance as royalty for coal which probably will not be mined in 50 years from now. They never could do that except by having an excessive rate on something; and the freight rates keep it up.

Q. (By Mr. RATCHFORD.) Do they own the surface?—A. In most cases they do; in some cases they do not; but they own the coal, and that is equal to controlling the situation. You often see it reported that the Philadelphia and Reading lost \$200,000 or \$300,000 last month. Whatever it may be, under the conditions it is not surprising at all. What they are paying for this undeveloped territory—taxes and everything—makes their fixed charges enormous. If you are operating an acre and have 4 or 5 acres that you are doing nothing with, and the acre must carry it all, you see you lose money. When you see it reported that they have lost money, that is true; it is true that the fixed charges, due to the policy adopted of getting everything that they can get hold of, make it heavy on the portion they are operating.

Q. (By Representative OTJEN.) If they were operating it all they would not be losing money?—A. That would be very different. That is an extreme case, when I speak of the Philadelphia and Reading operating a small proportion of the property compared with the portion that is undeveloped.

Q. (By Mr. RATCHFORD.) Have you given any consideration to the question of taxing, such as has been proposed in some of the States?—A. Not very much. Of course the rule is to tax these properties in different counties at different valuations. Whether that is equitable all around I am not prepared to say. I can simply say what the ordinary colliery tax is now—about \$2,000, open and developed; and there are 374 of these, and a very large territory undeveloped. What that taxation is based on in different counties I do not know.

Q. (By Mr. FARQUHAR.) Is it subject simply to the county assessors?—A. Yes. In some cases they regulate them upon the number of feet in thickness. Suppose there are five veins and in those five veins there is 30 feet of coal, they then place a valuation on the coal per foot in thickness. Other places they take it per acre without regard to the thickness of the vein. That depends entirely upon the commissioners or assessors, or the policy which they adopt in different counties.

Q. (By Mr. RATCHFORD.) You are speaking of the coal which is undeveloped?—A. Yes, generally. Suppose you take the assessment of 25 acres of unmined coal. So much is assessed on the plant. They rate those anywhere from twenty to forty thousand, then so much per foot in thickness on the unmined coal. In our county they make the assessment every 3 years. In the third year the engineer goes over the map with the commissioner, and usually the maps are sworn to, and they make the deduction.

Q. (By Representative OTJEN.) Have you had any strikes in your region in the last few years?—A. No general strike; some small local matters; nothing general since 1877.

Q. (By Mr. FARQUHAR.) What have been the economic results of strikes and lockouts?—A. There is nothing about that that you do not know—the physical suffering to the employees, etc.; to employers, loss of business and profits; to the community at large, restriction of business and tendency to violate laws, generally started by men who have no families. That we find. As to boycott or blacklist, we have very little of that. They have had more of that in the central coal region.

Picketing and patrolling is usually done by police, who guard and protect property. Results are influenced through conferences, with the view of mutual understandings, the hiring of workers who are nonsympathetic with strikes, and the closing of works until the old employees seek, from poverty, their places. Sympathetic strikes are frequently known to aid the original strikes.

Q. What have you to say on the importation of new or foreign labor under contract or otherwise?—A. There is no foreign labor under contract in the anthracite region that I know of.

Q. What nationality prevails in your mine?—A. There has been a great change in that region. Formerly the Irish and the Welsh predominated. There is now a very large per cent of Hungarians, Poles, and Italians—the three races that have come into the anthracite region in and about Scranton. Ordinarily, you might say those two first-named nationalities predominate.

Q. (By Representative OTJEN.) Have they come in gradually, individually, or have they been brought in in numbers?—A. Oh, I do not think there has been any attempt to bring them in wholesale. They come in with the train to-day and to-morrow they go to work. That has been going on for years, and in some collieries they predominate. In some collieries they have scarcely any miners outside of those two nationalities. But that occurs more frequently in out-of-the-way places, where they have a few houses put up and where they are huddled in. The other nationalities will not do that, so they get a large number in the smaller places who will put up with inconveniences. That class goes into places where the other class will not go.

Q. What classes are those?—A. Poles, Huns, and Italians. There are a few Swedes, but not so many. Those predominate in certain collieries. In the anthracite region, as a whole, the Irish, Welsh, and Germans, taken together, form the predominant element.

Q. (By Mr. RATCHFORD.) Do those people make as good miners as those that originally inhabited your region?—A. Not as good, as a whole. Of course, you will find once in a while a Swede or an Italian who makes a pretty good miner.

Q. As a rule, they are not as good as the others?—A. Nothing to compare.

Q. What are the influences of importation of miners under contract?—A. I think it is detrimental. There is no lack of laborers in this country, so far as we have been able to discover.

As to wages and methods of payment—I remember at one time our State passed a law that left it optional to pay every 2 weeks or every month. Some liked the 2-weeks arrangement. We rather inclined toward it, but the great majority preferred the monthly arrangement, and I am free to say we did ourselves. That class of laborers must have a day, or 2 or 3, you know, after pay day; and if they had their pay twice a week there would be the same condition to contend with. We have always used the monthly method, which I believe to be the best, due to the class of labor employed and their habits. Those people come from those countries where they have 10 holidays to our 1, and pay day is practically a holiday with them.

Q. (By Mr. OTJEN.) What have you to say of time work, piecework, overtime work, and task work?—A. For time work we pay a certain rate per day of 10 hours; for piecework, a rate or price mutually agreed upon; for overtime, usually one and one-half rate of time work; no task work. We do not use the sliding or the minimum wage scale in that region. We do not issue store orders, nor do we have fines and penalties.

Q. (By Mr. FARQUHAR.) Is there a system of store orders in your State?—A. There is what are called stores connected with the company, or some individual connected with the company. As to their method of dealing, doing their business, I do not know; but I will tell you what I think. Years ago the Reading, for instance, used to issue store orders. I have seen them. But up there we never had such a thing. I have known the Reading to issue orders for payment to their men.

Q. (By Representative OTJEN.) Do they now?—A. No; there has been nothing of the kind for some time.

Q. (By Mr. FARQUHAR.) Do the men owning the mines there erect tenements and rent them to the employees, or are the tenants free to go where they can shelter themselves?—A. Oh, yes; perfectly. The great trouble is they want those houses. For instance, we have 46 or 48 houses at a colliery, and the great trouble is—if we had a hundred I guess they would fill them. There are houses around, but they get them of us a little bit cheaper. For instance, an individual would charge \$8 for a house where we give them a house and a ton of coal every month for \$6. That is just about what we charge them for a house and coal. There are many instances of the kind. I do not know that many give them coal, but that is the way we do. Others, again, charge them so much and the men pay for their coal. There is a great inclination among the employers to put up more houses.

Q. At the same time the miners are free to hire tenements elsewhere?—A. Oh, they do; we have them everywhere, you know. I do not believe we have ever erected a house except at the special request of the men. We have in our colliery now men who want us to put up 10 or 12 houses, but we would prefer them to

have their own houses, because they make better employees, become steadier and more stable.

Q. (By Mr. PHILLIPS.) What is the condition of tenement houses generally in the anthracite region as to sanitary conditions, rooms, etc.?—A. I confess that perhaps they are not what they ought to be; could not be for the money. If we put up a house a little more costly and asked a little more, they would take the smaller house. Usually two rooms on the lower floor and a wash shanty outside.

Q. One story or two?—A. Two usually.

Q. Two rooms downstairs and two up?—A. Well, no; they divide up into about four sleeping rooms in two large rooms downstairs.

Q. (By Mr. C. J. HARRIS.) If you put up more expensive tenements at a higher price, they would probably take these cheaper ones in preference?—A. I think for the last few years that is about right. I do not believe to-day that our men could live and pay much more rent, because they are not able to work full time, because of the condition of the market. The conditions from a sanitary standpoint are very bad. When a lot of these foreigners go into these houses, you may find one little family that is clean and nice, and right adjoining it there is the essence of filth.

Q. (By Representative OTJEN.) How do the tenement houses owned by other people rent usually?—A. The average houses of the other parties are a shade better, average better, but they charge much more. I was just speaking about tenement houses. Different companies have different methods. We prefer not to have a single company house around the collieries. It is true we have bought collieries that had those houses, but very few were put up by ourselves. We have substituted some for those burned down, two or three or four of them, from time to time, and we charge our employees \$6 a month for the house rent and a ton of coal, furnished whenever they want it, once a month. Whatever they buy over that ton of coal they pay for.

Q. (By Mr. RATCHFORD.) I understood that you said the company had no stores?—A. No. That is to say, there are stores which parties interested with us are running; and many will call them company stores—you know how that is—but the company has not a single dollar in any store.

Q. Are those parties related with the mining companies in any business way?—A. Oh, yes; in certain things they are; probably may be connected in some business way, but I do not know anything about it—different stockholders.

Q. Does the mining company deduct from the miners' wages, in such cases, bills contracted in the store?—A. In our case, so far as the coal company is concerned, the store company asks permission to do that. What we told them was this: That if they would get the consent of the men in writing that they wanted it we would do it, and in nearly every instance they entered into the contract with the company. I mean that where they had it in writing we allowed deductions to be made.

Q. How do you regard the influence of the company store on the trade as a whole; do you regard it as something beneficial or injurious to the trade?—A. To a large per cent of the employees it is probably beneficial, but to the families, which is the larger per cent, I question very much whether they are benefited or not.

Q. Is it a fact that in some cases prices in the company stores for the necessities of life are extreme?—A. That has been so, and is so in certain places yet; but in our community, for instance, now, there are hundreds of stores in a big city there, and they can not do it, you know. They have to go pretty near the rate. They say that this company and that company are crowding their men, or some official of the company, or either the store or tenement; that they will get a few cents more on this or that.

Q. It mostly rules where there is no outside competition, if at all?—A. Yes; you will find collieries located in the interior some place where they have not competition. I presume there is a little advantage taken in that way.

Q. Where one operator has a store, and resorts to these extreme measures, and a neighboring operator gets the same mining prices, same rate of transportation, as well as his product at the same prices as the man who is keeping the store, is the latter not at a disadvantage in disposing of the product as compared with the other fellow?—A. Yes; the storekeeper, wherever he may be, has a little advantage.

Q. And if it comes to a question of the survival of the fittest, the man without the store would have to close his mine?—A. The man with the store would have a little advantage.

Q. Would you not go so far as to say that the man without the store would have to go out of business?—A. If either had to get out, he would have to get out first, I suppose.

Q. (By Mr. KENNEDY.) How is powder furnished to the miners; by the keg, usually?—A. Yes.

Q. Can you state what it would cost these storekeepers or miners by the wholesale?—A. The storekeepers never buy powder. The company furnishes all the powder. We buy that.

Q. Can you state about what you can get it for at wholesale, by the keg?—A. Why, I declare I do not know. There has been a little change in that price.

Q. Is it about 90 cents?—A. No; they had it at \$1.50, then they made it \$1.40 or \$1.35. I think the price is \$1.25. But it is lower in the Schuylkill region. You were pretty nearly right.

Q. Ninety cents?—A. It is \$1. That is my opinion.

Q. Our information is they charge the miners \$2.50 a keg, and they get it for \$1.20 a keg.—A. This arrangement is nearly 25 years old. They were trying to get \$1 a car for mining in that region. They wanted two things: First, \$1 a car; and they wanted a guarantee from the company that they would never advance the price of powder over \$3. They compromised, and the company agreed not to advance over \$3 for powder, no matter what it was, and it ran up to \$3.25, but they never raised it. The miners got the same and the companies never changed the price, and never changed the price per car, but they have lowered the powder. That is the old agreement, under which they had a right to do that; 1877 was the date of that agreement.

Q. (By Representative OTJEN.) Are there any mines operated there where they require the employees to buy at the company store?—A. I do not know. I could not tell you about that. I suppose there are some probably unreasonable, domineering foremen or superintendents who take advantage of circumstances all through. I think there is much trouble brought about by overbearing, domineering officials.

Q. Where the company collects or allows the amount to be deducted for the employees, do the stores pay them a commission?—A. I have heard that they collect for a given per cent, say 5 to 10 per cent; that I have heard. What is the question 23?

Q. (By Mr. C. J. HARRIS.) What would you say is the influence of organized labor on wages?—A. I should say little, if any. My impression is that it has given wages greater stability and steadiness, due to the fact that companies do not want to enter into controversies all the time with the men; and where they have been organized they have been able perhaps to regulate things, I believe, a little steadier than before we had organized labor. The increase and decrease of numbers employed I do not think has had much to do with it. I think it has given it a little steadier line. That has been my experience, as I say, in the anthracite coal region.

Q. (By Representative OTJEN.) Has the social condition of labor in your region in the last fifty years improved?—A. Yes.

Q. It is better now than it was some years ago?—A. It depends upon what you mean by better. I am not prepared to say that they are making more money out of mining. The community, outside of these later comers, has become more refined. Their families are getting on better. They are educated much better than they were; and, generally speaking, the social condition of those who have been in that country has improved. They are more refined. I do not say they get more wages.

Q. (By Mr. RATCHFORD.) Do you think they are spending what they do make more judiciously?—A. Yes. I think that part is due to the public school.

Q. What is the social condition of this class of miners that you spoke of a little while ago from the southern countries of Europe?—A. We can simply express it in a word; that is, as we look at it. They do not seem to measure up to the standard of cleanliness and law abiding as the older people do. I think there has been a wonderful improvement in the Irish, Welsh, and Germans, which largely predominate in the anthracite region.

Q. (By Representative OTJEN.) Do these later comers tend to show improvement after they have been here a while?—A. Yes. At a place called Nanticoke, where the Poles predominate—quite a number of Hungarians and some Italians, but the Poles predominate—those that have been there a number of years catch on gradually to American ideas, and their children—probably the superintendent there can tell you about those things. He says that they are just beginning to get anxious to send their children to school, and they are gradually becoming educated; but of course they have not advanced to the standards of these others yet. The worst thing we find is their filthiness. They will not keep themselves clean. I am speaking generally. Of course there are exceptions.

There has been an increase of employees. There have been odd spells when the

market was very dull, but generally speaking there is no excess to-day in the anthracite region of employees. We would be glad to hire 100 or 150 to-day or to-morrow if we could. I am speaking of certain collieries. Where they are surrounded or near a large town it makes it easier. But where the collieries are located a little farther from a large town it is harder to get them. They are like all others, you know, drifting toward a large town.

Q. That would be only for a part of the year—employment with you?—A. The wages are not so bad. I do not think there is much complaint on them. Everything would be reasonably smooth if the production was not so great.

Q. If there were more days of labor?—A. If the consumption was nearly equal to the production, which it is not. It is only about two-thirds, and hardly that.

Q. (By Mr. KENNEDY.) You say you could employ a hundred or two more men and would like to do it. That would indicate that you are not getting out a production that you could not dispose of. Is that so?—A. I could put those men to work outside of the breaker. But I am speaking of miners. In this class that come over there are very few miners. They have to go in and load coal, and gradually be educated to it that way. I am now referring to localities where it is not fully developed. This colliery is right on the line of the Delaware and Hudson. While we have houses there, they prefer to drift to the larger towns. I am only speaking of particular cases. I do not think there is any excess to-day. I saw it stated in one of our papers here the other day that it was doubtful if we would not be short of hands. We are only working a short time now. The consumers won't buy until they need the coal, anyhow.

Q. (By Representative OTJEN.) Are there any children employed in the mine?—A. Yes, of course; under the law we can not employ them in the mines under 14 years of age. We can not employ them outside under 12 years of age—in the breaker, for instance.

Q. And the law is enforced, usually—it is lived up to?—A. I am inclined to think it is, pretty generally, though it may not be lived up to as it should. If a little boy comes and asks for work, if he is going to work outside we will ask him how old he is. Of course, if he says he is 12 when he is not, and it is doubtful, we tell him he must bring a note from his father, showing his age. If he says he is 12 then he takes his chances, and not us. We are obliged to do that under our State law.

Q. (By Mr. RATCHFORD.) Whose duty is it to enforce the laws with reference to the employment of children?—A. The mine inspector's. There are 8 or 10 mine inspectors in the anthracite region. They are employed at the rate of about \$3,000 a year for a given number of mines, and it is their business to make inquiries and do their duty.

Q. Can you state in a general way, and as fully as you care to, as to the work of this mine-inspection department?—A. I should say that the great majority of them are really giving their attention honestly to do all they can to carry out the provisions of the mine-regulation act under which they are acting. Of course, there are some that are not giving the attention they should, just the same as any other line. You have all sorts of cases. It is their duty under the act to visit the mine at least once a month.

Q. (By Mr. FARQUHAR.) Do you think their inspection is impartial, or is there a kindness sometimes shown to the operator?—A. I have sometimes thought so, but generally speaking the majority of them are conscientious and try to do the fair thing.

Q. (By Mr. RATCHFORD.) Has it come to your notice, the claim that is so frequently made with reference to the mine-inspection department, that politics enters into the branch of inspection entirely too much?—A. I think there is some truth in that; that there is a little too much politics. Of course, there is another factor; oftentimes corporations use their influence for some person, and I think perhaps the average man will not be quite so severe where a corporation has aided him a little. I think that is another factor which is sometimes detrimental to the man's being absolutely free to carry out his inspections.

Q. (By Mr. FARQUHAR.) Are there frequent changes in the inspectors?—A. No; they are passed through a regular examination; supposed to be an impartial examination, like all other examinations. The highest, if the thing is fair, is appointed. He is appointed for 5 years; that is, he is recommended by the board of examiners to the governor, who appoints upon this recommendation.

Q. (By Mr. RATCHFORD.) Is the rule or principle of competency usually or always followed in the selection of these inspectors?—A. No, I do not think it is.

Q. That would seemingly be a bad influence for operators and miners and property involved.—A. Through some influence or other it is not always the best qualified man who is placed in the position.

Q. (By Mr. KENNEDY.) We understand that you have no screens in the anthracite region; but we understand there is a system there that the miners complain of and say it is more of a curse to them—to use their language and adopt their view of it—than screens in the bituminous region, and that is, where some officer employed by the operator condemns carload after carload of the coal which has been mined. Perchance some impurities have gotten into it which, in consequence of the smoke being so thick they can not see. Can you say something about that dockage system?—A. Yes; there is really but one remedy that I know of to cover that. As long as mining exists you know the miner will claim that he is wrongfully docked, while the operator, or the official who is looking after that, will claim that he is trying to do what is right. In some instances the men will name one man and the company another, and they will agree on the docking, and even then they will have difficulty sometimes. We pay you so much per ton for every ton load of clean coal in the car. If they could all agree upon a scale that worked satisfactorily, that would be all right, because every load is weighed there and they can put their check man there to look after every mine car. That is done and a record is kept of it, and they get credit only for the coal that is shipped. That is the chief difficulty. It does away practically with docking to a great extent. I know where it was offered that way and also by the car, and they accepted that way.

Q. (By Mr. FARQUHAR.) Do all carriers there weigh the mining cars?—A. No.

Q. Have you a system of gauging the weight of the car itself by the heaping-up process?—A. They do not heap them up so much. The great trouble is, where we have paid by the ton they did heap them. Where you pay by the car the car is measured. Where the rate is being fixed by the leveler to a 6-inch topping or ordinary topping, I guess you will find they are the same all over.

Q. Have you ever known of a case of the weighmaster throwing out a car entirely because it was not up to this heaping-up measure?—A. You mean the docking, possibly. Yes, I have heard of cases. Our rule—I think it is of a fair average of them—if a car is not right you will find it in docking. The miner that does the docking is some person familiar with coal and with instructions. We always follow that. I think the docking boss's business is one of the most perplexing things we have to contend with. If you dock, a man thinks he is wrongfully docked; if you do not dock, he will throw anything into the car. Some will; I do not mean all. I can hardly say about what is the best in the docking business. We say to the docking boss, "If it is not right, dock the man;" and we ask the man to come into the office and talk it over; and sometimes we suspend the man. Sometimes the man is wrongfully suspended, due to his laborer's fault in loading the coal. It is a perplexing question, always has been, to get the exact center of it and know the equity of it.

Q. (By Representative OTJEN.) What have you to say of public-school instruction—whether it is of the proper kind?—A. Yes; we think the public schools are admirable through that region—wonderfully improved. I am not an expert on school conditions.

Q. Are the schools efficient, and have you plenty of school facilities?—A. Oh, yes; I think you will find that it is admirably taken care of through the region. As to public libraries, reading rooms, and lyceums, there are very many of those, large and small. That is properly taken care of.

As to the earnings of capital, I can only speak of mining. As to the cost of railroads and the purchase of mines, originally, I would not attempt to say anything now, because that is a big problem; but as to the earnings of the coal operators, I think, take it year in and year out, we will always have 3 or 4 months' low prices; but generally, I should say from 5 to 7 per cent, take it through and through for 50 years. I am simply giving the average. I have known men that have made 25 per cent. I have known lots of men that have lost \$50,000 to \$75,000 a year. That is due to conditions. Sometimes these companies get to running each other on prices and it does not take long to make a knockdown of the whole business. I remember one time when they got coal down to \$2.70. We put in from \$5,000 to \$7,000 a month for 9 months to pay the men, and then they began to come to a better understanding. I suppose about everybody lost about all they got. Those are extreme cases as compared with other lines of industry.

Q. (By Mr. C. J. HARRIS.) Are there any laws that are detrimental to the pursuit of the coal business; that unnecessarily hamper you in your business?—A. Laws that have been passed have been beneficial when proposed and modified by persons who understood the situation. Sometimes we have had foolish laws that were not much good to either party, but by careful consideration on the part of somebody representing the labor side and another party representing the operator, we generally got together. The mine-ventilating act of Pennsylvania, in the

anthracite region particularly, entailed an immense cost upon a good many of us; I know it did upon us. Probably we expended at least \$100,000 just to comply with that act; and yet I am prepared to say, after many years experience with it, that I believe it has been beneficial. In the first place, in the mining it compels us to furnish 3,300 cubic feet every minute for every 50 men in the mine. If you did not do it, there would be a total stoppage through smoke and impurities, and in deeper mining there would be more impurities, gas and so on, to contend with. We used to think that if a man had 50,000 cubic feet of air in a mine it was a big thing. Now we have 200,000, and in the long run it is beneficial.

Q. Beneficial to both?—A. Yes; it has made things very much easier for the miners and laborers in the mines, and I am free to say that, while it seemed very hard for a time, years have demonstrated to me that it has been a very good thing for all concerned and a good thing for the community.

Q. (By Mr. A. L. HARRIS.) Do they not protect the operator in the case of suits for accidents frequently?—A. Yes; it provides that where you do not do so and so, that practically the companies become liable almost without a suit. It makes short work of it. For not complying with the law it is pretty difficult for a company to be acquitted, and hence we all now would rather comply with the law than have these \$5,000 and \$10,000 suits for neglect to comply with it; and to that extent I think the provision in the act is good; besides the risk of being prosecuted and having the suit against you altogether. Nine out of 10 of the operators get fair play in the courts if they comply with the law, but where they have not complied they suffer. In the mining of anthracite coal—I am not talking about the property, the land purchased, and railroads to connect them, and all that—but in the mining only of anthracite coal the proportion is about \$112,000,000 to 150,000 men. That is about the proportion. It fluctuates a little either way, of course.

Q. (By Mr. RATCHFORD.) You stated that the operators of that field had been contending for the same tonnage rate per mile for the transportation of anthracite coal that was paid for the transportation of bituminous, a reduction of 10 mills per mile to $2\frac{1}{2}$.—A. Yes; $2\frac{3}{4}$ is the rate now—that is the usual rate.

Q. If this reduction was granted, have you any idea what that 7 or $7\frac{1}{2}$ mills per ton would amount to on the whole product of your field?—A. The output of last year was forty-three millions. It is very easy to figure it; say it is three-quarters of a cent.

Q. (By Mr. PHILLIPS.) That is, per mile?—A. I say that.

Q. (By Mr. RATCHFORD.) What is the distance from the region to the general market?—A. About 145 miles.

Q. If this reduction was granted would it, in your judgment, reduce the price of coal to the consumer?—A. If that concession was made, it would prevent the advance. It would absolutely set aside the possibility of an advance for all three and a half coal in all probability. It would broaden the market for anthracite. In other words, we could place the coal 50 cents a ton cheaper at different points than we could without it.

Q. Would it have a tendency to increase wages or would it decrease wages?—A. I do not think it would have much effect on that, because it is purely a matter between the miner and the carrying company.

Q. Your opinion is that its beneficence would be only in extending markets?—A. Extending markets, and especially benefiting thereby both the employees as well as the employer; also all consumers.

Q. It would to that extent increase the number of days' work for every miner in your region during the year?—A. Decidedly; it makes a great difference.

Q. (By Mr. C. J. HARRIS.) And you would throw so many bituminous miners out of employment; so as far as that is concerned it would be as broad as it is long?—A. Not necessarily. The anthracite probably goes into a territory where there is no coal, and rather than pay \$4 a ton a good many will burn wood. If you can get it within what they consider their reach, they will burn the small anthracite, especially the small grades, because they are cheaper. There are certain districts that it is very difficult for the bituminous people to reach, and we, being a little nearer, could reach them. It might affect them; the tendency would be a little that way.

Q. (By Mr. PHILLIPS.) You spoke of having contracts with the railroads. What are the independent producers going to do when the existing rate contracts are terminated?—A. Some of them are terminated. We had one that terminated, and many others had contracts that are now terminated. They simply want us to renew at the old rate, and we will not do it.

Q. Have you any remedy to propose?—A. We do not see it yet. We are trying to bring about some remedy. What we claim is that they should give us a larger

proportion of that freight rate. We are asking for a 65 per cent contract, and 50 for small size. The old contract was 60, 45, and 32.

Q. Do you know of any way by existing law to reach that condition, or have you any law to propose that would reach it?—A. No; I do not know as to that, unless it would be, if it were possible, to increase the powers of the Interstate Commerce Commission so as to enable it to regulate things that are reasonable and compel railroads to carry things of the same risk for one party just as cheaply as they carry for others. They should have the power, in my judgment, to regulate that. They claim that they have not sufficient power; that they can say what a rate should be, but they have no power to enforce it.

Q. Do the reports say that?—A. Yes; I believe that is what they said; I believe that is the exact decision; at least that is the essence of it.

Q. (By Mr. PHILLIPS.) What have you to say of the regulation of trusts and other forms of monopoly?—A. I can speak of the effect I feel, but I am not prepared to say what the remedy should be. I am prepared to say two things: The pith of the whole thing is that the system of agreement or percentage system, in my judgment, is all wrong; that it should be governed by time work of those employed throughout the anthracite region. If there is a day or two more worked by one party than another, it is very easy to adjust it. The tonnage system is all wrong. Something that would bring about uniformity of the days of work for the employees in the anthracite region, who number 150,000, is the best basis, and, in my judgment, the only true basis to place the anthracite coal region upon.

Q. What would be the condition of the anthracite region if the railroads were not owners of the mines, and each company could work independently without any discriminating freight rates?—A. I think it would be practically a question of freight rates. Freight rates would govern everything. If they carried for the same as they carried bituminous, each company would have a general agency.

Q. Would you meet this overproduction the same as you do now?—A. The same thing. You would produce too much. I think it is absolutely essential to restrict, but I think the restriction should be had in days of work, and not in tons, at the discretion of the larger corporations. That is what I wish to emphasize, because I think it is important.

Q. (By Mr. RATCHFORD.) What is the effect of the use of modern machinery in mining?—A. There is no effect on prices to speak of. It tends to increase profits and reduce the number of laborers.

Q. Have you any mining machinery in your region?—A. In so far as the mining of coal direct is concerned, we have not; but in so far as handling it in different ways is concerned, we have. The capacity of the collieries has been increased three or four times.

Q. Are the employers' liability laws of your State detrimental to the trade generally?—A. I should say they are really beneficial, though they have been detrimental to individuals here and there. They have brought about a general condition of safety that would not have existed if it had not been for the acts.

Q. (By Representative OTJEN.) The law permits you to employ children 12 years of age outside?—A. And 14 in.

Q. Is not that rather young, in your opinion?—A. I think so; we think it should have been 14 outside and at least 15 inside, giving them a little longer chance for education in their early days. The child is tender at 12; at 14 we see quite a difference.

Q. (By Mr. RATCHFORD.) Have you a monthly, semimonthly, or weekly payment law, or are the terms of payment provided by law?—A. The payments were intended to be every two weeks, though the law leaves it in a way optional; but if the men demand it, we are obliged to give it. It works both ways. Most of them up there are paid by the month, mainly due to the class of labor. A large per cent of them want to get paid there two or three times, and that thing came so often that it was detrimental to them as well as the operators.

Q. What have you to say of uniform mining legislation in the different States?—A. I think that is possible. I think it is possible for parties familiar with the conditions to reason that out. While there are different phases and different conditions in the anthracite region—practically that is about all the difference there is in mining, different conditions—I think a general principle could be observed and a bill framed that might be beneficial to all the States.

Q. (By Mr. FARQUHAR.) Could there not be framed mining legislation that would be acceptable all over this country?—A. I think so.

Q. Beneficial alike to the operator as well as the mine worker?—A. Yes. Anything that is enacted which on the face of it shows that it is not intended to give equity and be equitable to the miner and employer alike can not last long until there is some change. Time has shown me that it is possible to frame a bill that

would be very satisfactory to the mining interests of the United States. It would take careful nursing by people familiar with it from the different regions.

Q. (By Mr. PHILLIPS.) Would such a law have to be enacted by the States?—A. Yes; but still be uniform.

Q. (By Mr. FARQUHAR.) If recommended by this commission, for instance—A. (Interrupting.) I think it would go a great ways toward uniform legislation.

Q. Do you think it would meet general expectation among all the mine operators of the country?—A. Yes; I think, generally, it would. I think it is possible, having representatives from the different States giving testimony and facts, people familiar with those conditions, men of large experience in connection with mining, giving what information they can, to a commission working in harmony with them, to frame a bill that would give general satisfaction and which would be taken up and followed by the States of the Union.

Q. (By Mr. PHILLIPS.) Have you any suggestions to make in regard to such a bill?—A. I should rather take up the mine-ventilation bill and go over that. That has been amended a number of times. That has been a very good bill and is to-day. I think there are chances to improve it for different sections of the State. I do not remember when that bill was passed. The anthracite bill was passed 20 or more years ago, and they have been adding to it and expunging certain objectionable features, so that they have now a pretty good law.

Q. (By Representative OTJEN.) It has grown by experience?—A. Yes; I think it was introduced as a result of experience with British bills.

Q. (By Mr. RATCHFORD.) Is it not a fact that the objections to legislation in the mining industry are very largely due to the causes that you assigned—either miners or operators, as the case may be, are prejudiced against that legislation before they give it a trial?—A. Largely so.

Q. And after they have tried the legislation it is almost invariably found satisfactory?—A. I should answer that by asking you a question: Has it not been your experience that wherever there is any legislation on any branch they hardly know how to take it? On the face of that bill, we thought it was going to be a hardship to us; that we would have to sink a shaft and put up an elevator; they said we were obliged to build it in a given time. We had no time to lose, and while that seemed very hard, I am free to say I have lived long enough and had experience enough to see that it was a good thing all around.

Q. Do the operators of your district favor conciliation and arbitration as a means of adjusting differences?—A. They are pretty well divided on that. I think it is possible. I have felt that for a good many years. The moment people get hot and the thing is carried too far arbitration is too late.

Q. Conciliation between representatives of both sides is what I speak of.—A. That has been pretty well thought of, and generally successful in our region. On the part of two or three companies there has been some little trouble. Have not had any for a long time, except little local affairs. That has been a good thing. Take that Schuylkill region. I think it is remarkable how they have gotten along, and finally gotten the sliding scale, which is a perplexing thing.

Q. How can committees representing miners and operators adjust a question of wages in view of the fact that the operators who meet the miners' representatives for this purpose have not the fixing of the price of their own product when the transportation companies fix it?—A. We have had great trouble on that question, and the only way we can get back to reason is to meet with the men. I have met them time after time on that very same subject; say to them, "If I pay you what Tom Jones and Tom Brown are paying both sides of me—my neighbors—ought you to ask any more?" We generally reason it out that way. There will be some little straw that we give and take and get it as near our neighbors' as we can. We are all governed by what those companies pay. Some operator will pinch and trim a little to get more profit from his business.

Q. If the operators in your region were free agents to transport and sell their own product and fix their own prices, would that not encourage the principles of conciliation as between yourselves and the miners?—A. I think it would. The operators would become more of self, and would not have to refer to other interests.

Q. (By Mr. KENNEDY.) Are your miners organized?—A. Not that we know of. I will say this: There has been considerable organizing, and while to-day there may be an organization which is perfect, there has not been much of an organization around Scranton for a number of years. There has been a nucleus of it, and I understand that of late they have been putting their heads together to begin to increase the strength of their organization.

Q. Do you think an operator who employs organized miners is at any disadvantage in the business?—A. No; I do not see a bit of difference. We do not know whether we are employing organized labor or not. They are pretty well

mixed. I take it that we have a number—practically half of our men—in the organization. I do not know how many; I know there are some. That is a question we do not have much trouble about. We have not found this to be the case of late years, that any unreasonable demand is made on the part of those organizations; that is, generally. If there is any fault-finding, they take it up and say: "Here, that is not exactly right; we had better remedy that." Really, we have had very little trouble that way. I will tell you where it is a pretty good thing: Generally where there is an organization, if we can understand, and we generally do, that there is a little dissatisfaction on some point, we begin to take it up quicker perhaps than if there were no organization.

Q. Would it be any advantage to the employers to have all miners organized and to fix the scale that all would have to pay, and no deviation from it?—A. I do not believe it would be any disadvantage. In the lower end of the anthracite region that sliding scale is practically open. It is really an organization of labor consulting with organized capital. They have run along quite smoothly; seem to get along quite nicely.

STATE OF PENNSYLVANIA, *County of Lackawanna*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

R. G. BROOKS.

Sworn and subscribed before me this 24th day of July, 1899.

WM. W. WILCOX,
Notary Public.

WASHINGTON, D. C., *May 10, 1899.*

TESTIMONY OF MR. WALTER J. MULLINS,

Coal Operator, Wooster, Ohio.

The commission met at 11.10 a. m., Vice-Chairman Phillips presiding. Mr. Walter J. Mullins, of Wooster, Ohio, appeared as a witness at 2.55 p. m. The topical plan of inquiry on mining was followed.

Q. (By Senator DANIEL.) What is your business?—A. I am a mine owner, and manager of several mines.

Q. Have you anything to say as to the growth or incorporation of trade unions?—A. In the mining industry trade unionism has grown very materially in the last 15 years, and while I can not give the proportion of employees embraced in the membership generally, I can say with reference to my own State that probably not less than 90 per cent of the miners are members of trade unions.

Q. Have you ever been a member of a trade union yourself?—A. No.

Q. Have you formed any particular ideas as to the legal effect of trade unions, whether beneficial to the trade or those who are members of them?—A. My experience or observation has been that they have been rather beneficial both to the employees and to the mine owners, for this reason: With an organization that is managed by conservative and able men, as has been the case with the miners' organization for some years past, we have been able to form a fair basis of prices. It has made our industry more stable, and has given a certain security to our operations that we could not have had if we were troubled by local disturbances, as was the case before the union was formed and made as solid as it is now. I have been for some time rather pleased with the miners' organization. I know nothing whatever about the others.

Q. Have you had any observation as to the difference between nonunion and union labor?—A. I have not really had any experience as to that, except that two of our mines were operated under nonunion labor for a number of years and have only lately been incorporated by the United Mine Workers. I have not observed there any material difference, because they were governed largely by the labor union in their scale of prices, etc., and I could not say that there was very much difference between them and the mines operated under unionism.

Q. Have you had any strikes or lockouts in your region lately?—A. No; not for nearly 2 years. In the last 5 years we have had two or three strikes and lockouts. We have a little local affair at one of our mines at present. It is a disturbance that is purely local.

Q. Have you had any experience with arbitration in the trade?—A. Yes; have had some; not a great deal. We had a strike in 1894 in what is known as the Massillon district of Ohio—quite a considerable district, where we are interested. I think the duration of it was about 9 months. It began in February, 1894. That was finally settled through the medium of arbitration. We have a State board of arbitration, which was organized under the State law a couple of years prior to that time.

Q. Is it compulsory?—A. No; it is voluntary. After this strike had gone along about 8 months they volunteered their services and endeavored to bring about a settlement; and largely through the mediation of this State board of arbitration we finally agreed on a plan of arbitration, which was not conducted by the State board, but by a local committee of three arbitrators, and the matter was settled in that way, although the settlement was not at the time satisfactory to the miners, and they did not accept it.

Q. Is the public mind favorable to arbitration in your section?—A. That is rather a difficult question to answer. The operators, as a rule, are favorable to arbitration.

Q. How about the miners themselves?—A. I think in my immediate section the miners are hardly as favorable as they were, but they are always ready to accept the intervention of this State board; I have noticed that. I think the disappointment of this one decision had a great deal to do with making the miners dissatisfied with arbitration as a means of settlement in that section. What it is generally throughout the State or generally throughout the mining districts of the different States I could not say.

Q. Do the operators keep what is known as a blacklist?—A. I have never known of its being done.

Q. What are the nationalities of the miners employed in your mines?—A. I think possibly the majority of the employees employed by us are men of American birth. We have had men in our employ at the different mines for a great number of years, originally Irish, Welsh, English, and German. We have very few of other nationalities.

Q. You think the American element predominates?—A. Yes.

Q. Are they white or black?—A. White, altogether.

Q. Is there much jealousy manifested by the Americans against their foreign neighbors there?—A. No. As a rule, through the State of Ohio, the Americans are sons of the foreigners who were originally miners. We have not as large a proportion of the foreign element as elsewhere.

Q. You have little friction on that subject?—A. Very little throughout Ohio.

Q. Have you had any observation of the effect or use of injunctions in strikes?—A. Not personally. All I know of that is from newspaper reading and hearsay.

Q. How do you pay the wages of your laborers?—A. Semimonthly.

Q. Do you think that is the best?—A. I think that depends upon the character of the miners. Generally with the class of miners we have, and, I think, generally throughout the State of Ohio, with which district I am most familiar, I believe it is beneficial; but I do not believe it is beneficial where the men are inclined to take holidays on pay day, because it results in spending more money throughout the month than they would otherwise spend. But with the class of miners I have had to deal with, I think it is beneficial. I think it encourages them and is a very good thing.

Q. How do you pay wages?—A. We pay the miners who do the mining of the coal so much per ton. Then there is a large class of day labor (we have a large number of men who are employed by the day) paid so much per day.

Q. What is the average earning of a coal miner?—A. In our district, what we call the Massillon district, it varies. For the day's work it averages about \$1.90. I should say the average throughout the State of Ohio at the present would be \$1.75 a day.

Q. What would be the average for the year?—A. That varies so much on account of strikes and lockouts that it is very hard to determine. The mines there, as a rule, I should say, do not work over 200 to 225 days per year.

Q. The average miner would be paid \$1.75?—A. Yes, taking all the districts, thin and thick coal, and so on. In some districts they make as high as \$2.50. In our mines they make as high as \$3.50.

Q. Do you have any sliding wage scale, or any minimum scale by law or rules of the craft, or anything of the sort?—A. No.

Q. Can a man support a family on a miner's wages in Ohio?—A. I think that they could do it pretty well. They do it pretty well in some districts. It is a difficult question to answer for the reason that in some districts in Ohio the miners have comparatively steady work, while in others they have not; and in some of

the districts the wages per day do not form a sufficient earning capacity for a man to support a family throughout the year properly, in my judgment; in others they do.

Q. Are the men paid in money or in store orders or in other things?—A. Generally now, in money. Up to within a year or two they were paid almost wholly in some sections in store orders. That was one respect in which the United Mine Workers' work, I think, was beneficial; it largely did away with the custom of paying in store orders.

Q. As a rule now they are paid in cash?—A. In money.

Q. And semimonthly?—A. Yes. We have a State law in Ohio compelling payment of wages semimonthly.

Q. Has there ever been a decision by the supreme court on that law?—A. I do not know. It applies only to corporations. Individuals could evade the law if they desired. It is the general custom there now, and it universally prevails there.

Q. Is there any system of fines and penalties that operates upon the miners?—A. The only penalties that I am aware of are those attached to the sending out of what we call "dirty coal," a technical expression. When a man loads slate and stone or an excess of material of that kind, slack mixed with slate, in a car, it makes it practically unmarketable.

Q. It is a certain drawback to him?—A. Yes.

Q. Is that acquiesced in as an equitable thing?—A. It always causes some friction. There is no general rule about that. It is one of the most difficult problems we have to encounter. A good miner will never do that. A good miner will always be careful that his coal is clean. The careless miner is the one who causes the trouble. It is difficult to fix upon a fair basis for compelling the men to send out good coal. We use a system of docking to a large extent in our mines. We generally deprive them of cars for a little time, although at some mines we have a sort of arbitration. They have what they call a mine committee, and when there is a question about the justice of the dock this committee is called out, and the representatives of the mine owners and the committee meet and adjust the matter.

Q. As a rule, do the miners occupy their own houses or rent houses owned by the mine operators?—A. I should say, as a rule, throughout the State they occupy rented houses.

Q. Are they owned by the companies or corporations?—A. I do not believe that would be general. A great many companies do own their own houses. I think a far larger part of the miners rent houses that are owned by individuals throughout that State.

Q. According to your statement the miner working 225 days a year, and averaging \$1.75, would earn, on an average, in Ohio, \$393 a year?—A. I should think that would not be far out of the way, under best conditions.

Q. Do you know whether that is above or below the average in other States?—A. I do not. There are some districts that bring that average away down.

Q. How long have you been in the mining business?—A. I have been actively engaged in it for 15 years.

Q. How do wages in mining compare with what they were at the time you went in?—A. I think they are about 12 per cent less to-day than they were at that time.

Q. How do you account for that?—A. Increase in production of bituminous coal. The production in bituminous coal has increased more in proportion than the consumption. Fifteen years ago West Virginia had a production of less than 1,000,000 tons per year; last year the production was over 15,000,000 tons; and other States have increased in proportion. Natural gas and oil have had some effect in reducing consumption.

Q. What is your observation as to the condition of the mining class in that 15 years? Do you think it is in a progressively improving condition or otherwise?—A. As to the material condition I can not say. They have improved, because until within the past 2 years the condition of the mining business was very unsettled, and we had so many strikes and shut-downs of one kind and another that the miners suffered in consequence; but I have noticed a very marked improvement in the condition of the miners as far as education is concerned. I find that the miner, educationally, is improving all the time.

Q. You have not found a corresponding increase in his material prosperity?—A. No.

Q. As to the habits and manners, do they show improvement?—A. I think they do, decidedly. I can not speak from my own knowledge of those miners who are what you would call immigrants, but the miners that I have known, who are citizens of this country, and have been for a great many years, have shown a

decided improvement in their habits and general condition, except possibly their material condition. They have improved materially in the last 2 years, but for 5 years previous to that there was so much depression in their business that they lost a great deal they had gained before.

Q. Is the industry, taken as a whole, in a satisfactory condition in your State now?—A. No; I can not say that it is. I regard the price of mining as too low to be satisfactory to the miners. That is caused from the fact that the selling price of coal is too low, while almost everything else in manufactures and the product of the earth—oil, iron, etc.—has gone up. The price of coal is nearly as low to-day as it was when we were paying a much greater price for mining.

Q. To whom do you sell your coal?—A. We sell to the railroad companies—Pennsylvania Company, Nickle Plate, and in Cleveland. Our general and best market is Cleveland, Detroit, and Toledo.

Q. Do you put it on the general market?—A. Yes.

Q. Sell to anybody that comes along?—A. Yes.

Q. Have you offices in the cities where you sell it?—A. We sell through offices in several cities—Cleveland, Toledo, and Detroit.

Q. It is open is it, or contracted to certain companies?—A. It is only contracted by the limitations of freight rates. We sell wherever we can get a freight rate that enables us to deliver it in competition with other coal.

Q. There is no restriction as to your willingness to sell to anybody?—A. No.

Q. How many tons of coal do you turn out in a year?—A. At all our mines probably between 500,000 and 600,000.

Q. What is the average cost of production of your coal?—A. It is hard to average the cost. In one district the cost is at least 25 per cent more than in another district. I can hardly give you, without figuring it over a little, what the average for the whole tonnage would be. I could get that very quickly, though. We make a statement each year to the Commissioner of Labor, showing the average cost of the coal at the different mines.

Q. Will you speak of a particular mine?—A. In what we call the Massillon district the average cost last year was about \$1.05 a ton.

Q. For taking out the coal?—A. Yes; that is high-priced coal; that is coal that costs more than any other. In our other district, in what is called the Columbiana County district, the average cost would be probably 25 cents per ton less. I am speaking of the price for lump coal.

Q. What is that coal used for?—A. The Massillon coal is used largely for domestic purposes; chiefly for that; and the balance for steam purposes.

Q. What are the markets for that coal?—A. The markets for that coal are northern and northwestern Ohio, Michigan, and part of Indiana.

Q. At what do you sell it to the railroad companies?—A. We do not sell any of that coal to the railroad companies; it is too high priced.

Q. At what do you sell it to the consumers?—A. At an average of about \$1.30.

Q. Make about 25 cents a ton?—A. We do not make that throughout the year. I do not mean that is the net cost of the coal. I mean that is the cost of the coal produced at the mine.

Q. \$1.05?—A. Yes.

Q. And the \$1.30 is what you sell it for at the mines?—A. Yes, about that, but we do not net 25 cents on the output.

Q. What does that coal sell for in its chief markets, and please name those chief markets?—A. The chief markets of the coal are Cleveland, Toledo, and Detroit, and then it is sold in a very large number of smaller places throughout northern Ohio and Michigan. It is retailed in Cleveland at present at \$3.15 a ton.

Q. How much of that is transportation?—A. Sixty cents.

Q. And the rest is the profit of the retail dealers?—A. Partly the profit of the retail dealer. The retailer must have from \$1 to \$1.10 on the coal, delivered in his yards, in order to pay for his haulage charges and the cost of his force, etc.

Q. Does the price vary in proportion to the distance from the mines?—A. Yes.

Q. Is there any complaint there by the operators, or any known ground of complaint that you are aware of, as to freight rates?—A. There is no general complaint, perhaps, such as would prevail as I understand in the anthracite region, but there are isolated cases, generally occurring so frequently as to disturb the operations of the individual operator. We find, for instance, where the railroad company owns its own mines, as is the case with a number of railroads in Ohio, that it will fix rates, in competing for large contracts, that make it impossible for the individual operator to secure a contract.

Q. What railroads in Ohio own their own mines?—A. The Cleveland, Lorain and Wheeling Railroad Company is operating mines under the name of the Pittsburgh and Wheeling Coal Company, as I understand it.

Q. What is the connection between that coal company and the railroad company?—A. I think they are entirely separate in incorporation. All I know is that the two are managed by the same officers. I want to say for this road, that I am told it will protect its individual operators. I have no mines on that railroad, but I know from information that they do protect their own operators to a very large extent; that is, they will give them the opportunity of competing with their own mines on equal freight rates, or will give them a proportion of the tonnage they secure on these large contracts.

Q. Do you know, or have you any reason to believe, that the railroad officials who run the coal company give any partial advantages to themselves in any way, in freights or otherwise?—A. I really do not. I only know this—that where some large contracts, for steam purposes, for instance, are open to competition some individual operators very frequently find a price being made which they consider less than they could offer to produce coal for, delivered at those places, and which accordingly must be made up in freight rates.

Q. In advantages accorded to themselves in freight?—A. Yes.

Q. Has that matter ever been investigated in Ohio?—A. I do not think it has. That is the case with a number of other railroads.

Q. We would be very glad if you would name all those railroads and give any statement that would be advantageous in ascertaining how and wherein they discriminate against localities or persons.—A. I will name the railroads that are interested in mines that I know of, either directly or indirectly, but so far as the discrimination is concerned I can not speak from my own knowledge. I would not like to be quoted as saying that, except that I know of certain contracts.

Q. Please state of your own knowledge, or what comes within general rumor, the names of the companies.—A. The railroads that I know of being interested in mines are the Cleveland, Lorain and Wheeling, Wheeling and Lake Erie, and the Columbus and Hocking Valley. I am not positive of any others being interested. I think the Columbus, Sandusky and Hocking Valley is also interested. I am not sure about that, and would not like to say.

Q. Have you a railroad commission in Ohio?—A. We have a railroad commissioner there, but I think we have no commission.

Q. Has he authority to investigate questions of that kind?—A. No.

Q. Are the stockholders of the railroads interested in the coal companies, or is it in the interests of the officers of the roads you refer to?—A. I only know the arrangement of the different companies is the same—that is, the coal company and the railroad company is practically the same.

Q. (By Mr. A. L. HARRIS.) Is it not supposed that the president of the Hocking Valley Railroad at one time used the stock of the road in purchasing a large amount of territory or getting options on a large amount of territory in Ohio?—A. Yes. That I know only from hearsay and newspaper reports. I understand they used about \$8,000,000 at one time for that purpose.

Q. (By Mr. RATCHFORD.) Does the Toledo and Ohio Central Railroad come under that same heading?—A. I believe it does.

Q. What can you say about the line that parallels the Cleveland, Lorain and Wheeling—the Wheeling and Lake Erie; is it true that there was indiscriminate cutting of rates on that road some time ago?—A. I could hardly answer of my own knowledge as to that. I can speak more particularly of cuts that I am quite sure are met on coal hauled from West Virginia. I believe that road made rates on the hauling of West Virginia coal through to the lakes that were lower than the rates made to mines on their own road, which had half the distance to deliver the coal. I had that on authority that I think is beyond dispute.

Q. Are they hauling the coal from West Virginia for less money than they are from mines along the road to the market?—A. Yes, with half the haul. I have brought this matter to the attention of the officials of the road, and told them it was not encouraging for operators along the line. They claimed they had to do it because other roads were doing it, notably the Baltimore and Ohio.

Q. What is the difference in the distance between those mines in Ohio and the West Virginia mines?—A. About 125 miles from the market.

Q. What was the effect of cutting the prices?—A. It has been very disastrous for Ohio coal. For one thing, it has made it almost impossible to deliver Ohio coal on board vessels for lake shipment. Also, it has had a very disastrous effect on Pennsylvania interests, because the West Virginia coal hauled at those rates is enabled to undersell the coal of Pennsylvania.

Q. (By Senator DANIEL.) Will not the Pennsylvania coal have to go farther than the West Virginia coal?—A. Yes, somewhat farther; but the West Virginia coal has been hauled much cheaper to the lake front.

Q. Do you know any cases of discrimination as to coal going East?—A. No, I

do not. Ohio coal is not shipped East, and my acquaintance is mostly with Ohio coal.

Q. Do you know of any other discriminations of railroads that are injurious to the mining interests of your State, with reference to particular parties or particular cities?—A. I do not know, by personal experience, of any. I have been told by a great many operators that the individual operators are discriminated against in the matter of car supply. My own experience has been that we have not been discriminated against to any great extent.

Q. Do you know of discriminations in things other than mining that would enter into industrial relations—iron or any other metal?—A. No, I do not.

Q. Do you know of any trusts or combinations in the mining business?—A. I do not believe, in the bituminous business, that there are any trusts at the present time; that is, there are no combinations that are effective as yet. There are several that have been, as I understand it, talked of, but none of them consummated, as far as I know. There was a sort of trust in Ohio last year, called the Central Coal and Coke Company. That was a combination of railroad interests—those that I have mentioned and a branch of the Pennsylvania; but that was dissolved last fall. Then there was another combination, called the General Hocking Coal Company. That was also dissolved.

Q. Were they dissolved by legal procedure or have they gone to pieces?—A. By mutual consent. They disagreed. There is a combination now being talked of, I believe, in the Pittsburg district, but it has not been consummated as yet.

Q. How do the operators and miners feel with respect to the 8-hour law; or do you have one in Ohio?—A. We have not an 8-hour law in Ohio. We have an 8-hour agreement with the miners.

Q. Is 8 hours considered your workday?—A. Eight hours is considered our working-day. That was agreed on at the Chicago convention a year ago last January.

Q. Does it give satisfaction to the miner?—A. To the miner it does, and I think generally to the operators. At first the operators disapproved of it, because it made quite a difference in their production.

Q. How long has it been the rule in Ohio?—A. Only since a year ago last April.

Q. What is your observation as to its operation on the character of the laborer, and the quality and extent of his product?—A. So far as the miner is concerned, I have not been able to notice any material change. I think that the results of his labor are about the same. Of course he does not get out quite as much coal, and makes possibly a little less from a day's work. That is probably on account of the facilities of the mine. Where the mine is prepared to take care of the coal, I believe, in our Massillon district, the miner can mine as much as he could before in the 8½ or 9 hours, because a large part of that time he was waiting for cars or something of that kind. It depends largely upon the equipment of the mine for taking out coal. If the coal can be handled promptly outside, the miners can produce as much in 8 hours as they did before in 9 or 10. If the mines are prepared to do that there is not much difference in the output.

Q. (By Mr. RATCHFORD.) Has the shorter workday had the effect of improving the mine equipment as a general thing?—A. I think it has.

Q. Are they prepared to handle the same amount of tonnage as they handled formerly in the long workday?—A. Yes, at a great many mines. It really has not made as much difference as the bare 8-hour rule would imply, because formerly the miner, while he may have worked 9 or 9½ hours, and in some cases 10, at that time was not required to be at his work place (that is, where he actually labored) at the beginning of those 9 or 10 hours. By the agreement reached at Chicago and at Pittsburg the miner is required to be at his working place when the 8 hours begin and when the 8 hours end, so there is not as much difference in the actual time spent by the miner as would seem from the bare mention of the 8-hour day.

Q. (By Senator DANIEL.) Are company stores in vogue in Ohio?—A. No; the United Mine Workers have succeeded in practically abolishing those, except where they are operated possibly by some persons connected with the company; but they are not known as company stores except in a few cases. I believe there are still a few stores in Ohio.

Q. Have you a law in Ohio regulating the employment of children in the mines?—A. Yes. That has been amended. Formerly it required that they should not employ children under 14 years of age; the age has been extended this year to 15. We are not permitted to employ children under 15 years of age within the mines, and they are never employed, to my knowledge, outside at bituminous-coal mines. In the anthracite regions they are used for picking slate, etc., in the

breakers. We do not use children outside the mines at all. Inside they are used for "tending" air doors.

Q. Do you think it is a good age to limit the employment of children?—A. Yes. Q. What has been the effect of that law in your State with respect to the conditions of laboring people?—A. I think it has improved them considerably in an educational sense, because the children of an age that went into the mines some years ago when, I believe, the age was 12, are now in school a large part of the time, where before they were working.

Q. Is it liked by the working people themselves?—A. I can not say that it is, altogether, because a great many of the thrifty ones want to see the children employed at a lower age than they can now have them employed.

Q. Does it meet with general public approval?—A. I think it does.

Q. Do you have any trouble with convict labor in your State?—A. No; we do not employ any convict labor in the mines in our State.

Q. Have you any suggestions to make to the commission on the general subject of mining or any part of it?—A. A question was suggested to my mind this morning as to the advisability of some law, possibly not a general law, because, as I understand it, it would have to be passed separately by the States, regulating production of coal of the different classes; regulating it in such a way as to place different districts on a common basis for meeting the market. It would be fair for everybody, and I think it would benefit the conditions of labor throughout the different productive districts.

Q. Is not the mining industry of the United States, recognized to be within the jurisdiction of Congress, more interstate in the way of transportation than anything else?—A. Yes.

Q. The fairness of the transportation facilities to the different sections?—A. Yes; I think that is a most important question.

Q. Do you know of any other question connected with mining that approaches that in importance?—A. No; I think that is decidedly the first in importance—the regulation of transportation so as to give the individual owner the same chance in the general market with the railroad owners.

Q. Have the miners of your State ever made any cooperative effort to secure equitable rates of transportation?—A. Not to my knowledge. I do not believe there ever has been a movement of that kind.

Q. Why do you not move to do it?—A. I do not know why it has not been done.

Q. Afraid of the railroads?—A. Well, possibly some of the operators are afraid of the railroads.

Q. Have you any suggestion to make on immigration, coming within your experience?—A. I have not had any personal experience with foreign labor, and my only information as to that is what I have heard from other operators.

Q. (By Mr. A. L. HARRIS.) Is there any organized combination on the part of operators to restrict production?—A. No; not to my knowledge. I do not believe there is anything of that kind existing now. One of these organizations or combinations of which I spoke a while ago, I believe, had a limit to their output in this way: Each company interested had a certain proportion of the total tonnage, and when they exhausted that they were restricted. But that combination is not in operation now, and to my knowledge there is no such combination in the State of Ohio, at least.

Q. Are such combinations favorable to operators and miners?—A. I do not believe they are. I do not believe the operators generally regarded them favorably.

Q. Do you employ nonunion labor in your mines?—A. No. All our men are union labor.

Q. Are you compelled to employ organized labor, or do you do it of your own accord?—A. We have never asked any miner questions, whether union or not. We have never had any difficulty of that kind with our men.

Q. I understood you to say you did not employ any but organized labor?—A. So far as I know every man in our employ belongs to the union. They sometimes come there not belonging to the organization, but miners generally induce them to join. I have never known them in any case to refuse to allow men to work there, but they generally persuaded them to join the organization.

Q. (By Mr. RATCHFORD.) When a miner applies for employment is he asked the question as to whether he belongs to the miners' union?—A. No; not by the operator.

Q. If he does not belong to the miners' union do the men in your employ demand that he shall belong before employed?—A. I never knew of any case of that kind.

Q. But after he is employed they endeavor to persuade him to meet as well as join them?—A. Yes, I have no doubt of that.

Q. You spoke of strikes in the past 2 or 3 years; do you care to go back and state in your own way the causes that led to them, taking them up separately?—A. I will speak of one of the general strikes. I do not care anything about local strikes. The first general strike occurred in 1894, I believe, and was after a long period of prosperity in the mining interests, really brought about by mutual agreement each year. We had had during the 80's, for 6 or 7 years, and I may say in 1890, what we called an interstate board for conciliation and arbitration. We met each year, adjusted prices, and representatives of the miners' organizations and the operators fixed a schedule for the coming year, and it went along very smoothly for, I believe, 7 or 8 years, and then trouble began in the Pittsburg district. As I remember it, one of the largest companies in that district had been endeavoring to force the price of mining down in order to give themselves a better opportunity to compete in the market, and it finally succeeded in reducing the price 10 cents below neighboring operators. It compelled the other operators of the district to ask for lower prices, and the miners at first would not concede this. There was a long fight made on that question, and the competition became so keen that some of the operators forced the price down, and it resulted in a general demand for readjustment. The whole organization was called out. I think it was in April. That began the first of these general strikes. I always thought it was caused by the action of one company in the Pittsburg district—the New York and Cleveland Gas Coal Company.

Q. What was the outcome of that strike?—A. Well, the outcome of that strike was a settlement at the time—a small compromise; 10 cents of an advance, I think it was.

Q. Did the effect of that strike, according to your judgment, stimulate the coal business for any length of time, or do it any good in any way, or otherwise?—A. I am hardly competent to answer that, because at that time we were having trouble with a great many of our mines. It was not settled at that particular time. It had the effect, however, of consolidating the miners' union, making it stronger, making it more general in its operations than it had been before, and that is the only way the union could be of any benefit to the mining trade generally. If it were effective only in Ohio it would be a detriment to our State; if effective enough to control products of competitive fields, then I think it a benefit.

Q. You spoke of the more recent strike of 1897; what was the cause that led to that strike and the result of it?—A. Well, it was caused very similarly to the first. It began in the same field, and was caused largely by the same company, compelling other competing operators to cut their prices, and resulting in the demand on miners for lower wages, which was resisted; and that was finally settled after a little over 6 weeks by an advance of 5 cents a ton.

Q. In each of those cases were the strikes only resorted to after conciliation had failed, or is the commission to understand that no effort was made to adjust the question of price by mutual agreement?—A. Personally, I have no knowledge as to that, but I understood from my reading at the time that a number of efforts were being made. Committees met, I know, on the part of the miners and operators, before the strike took place, in an effort to adjust differences.

Q. Since the strike of 1897, what progress have the miners and operators made toward joint conciliation?—A. A joint conference was arranged in January, 1898, at Chicago, which brought all the operators and miners of the States that are in the northern territory except West Virginia together, and that conference resulted in an advance of 10 cents a ton to the miner, and the adoption of the 8-hour day and some other things.

Q. At the present time you are working under these joint agreements, are you?—A. Yes.

Q. How are they regarded generally by the employing classes?—A. I think the general opinion is that an annual agreement is a very beneficial arrangement because it enables the mine owner and operator to figure intelligently on his yearly contracts with some guaranty that prices will be maintained throughout the season of his contract, and it insures him regular work unless there is some local difference at the mine. I have always been in favor of that system of settling the wage question.

Q. Are there any binding clauses connected with those joint contracts; any penalty for violating them?—A. There are not; I can not think of any specific penalty.

Q. Simply a question of honor?—A. Honor; yes.

Q. Are they generally observed?—A. I believe generally. I do not know any case where they are willfully disregarded. I know there is some misunderstanding as to the construction of the agreement, and some disputes have arisen because the contract was not, perhaps, as clear as it might have been made; but

I do not know of any cases where there was intentional disregard of the contract itself.

Q. The larger concerns, I presume, who are partners to this agreement, usually carry it out?—A. Yes.

Q. If two or three or half a dozen of the larger concerns in any one State would put a false interpretation on parts of that contract, or would operate their mines, paying a less price than the contract provided for, or less than the general scale, what, in your judgment, would be the effect of such action; would it lead to a general reduction in that State?—A. Yes; I think it undoubtedly would. It would be impossible for smaller operators to compete with the larger concerns in the general market, and of course they would have to have the same conditions of operating as the larger companies.

Q. It is to be taken, then, I presume, that a uniform rate of mining must obtain before the coal trade is on a permanent basis?—A. I think so, decidedly.

Q. Would the price still exist in one field while a lower price was being paid in another?—A. Oh, no.

Q. (By Senator DANIEL.) How would transportation affect that? Would not that be a great factor?—A. Transportation, of course, would have quite a bearing on that.

Q. If you had perfectly equitable rates of transportation, would not a fixed tendency be created for the best goods to go to the market at forced prices?—A. That is a problem I am hardly competent to figure out. It would, certainly, if we had perfectly equitable rates of freight, etc.

Q. I say equitable; what is exactly equitable it is very hard to say. One railroad costs so much more than another, and so many factors enter into the problem that it is very hard for the most righteously disposed mind to arrive at what is equitable.—A. Yes; that is really the problem—to decide what is equitable. If railroads charge what we consider an equitable rate of freight from the West Virginia fields, the West Virginia fields will not be producing over 2,000,000 or 3,000,000 tons instead of 13,000,000 tons. That is the point.

Q. (By Mr. RATCHFORD.) A while ago you said that when you first went into the coal business the West Virginia field had been producing about 1,000,000 tons a year.—A. Less than 1,000,000.

Q. How much has the annual tonnage of your own State increased in that time?—A. I do not believe it has increased over 3,000,000 tons in that same time.

Q. (By Mr. PHILLIPS.) What is it now?—A. It is now less than West Virginia, a little over 12,000,000 tons last year.

Q. (By Senator DANIEL.) Might that not arise in a degree from the luxuriant productive capabilities of West Virginia?—A. Yes. It is a very fine coal, and it is a coal of unusual thickness. It is easily worked and easily mined. That has a great deal to do with it.

Q. (By Mr. RATCHFORD.) What have you to say about remedial legislation?—A. As to employers' liability laws we have not any specific legislation except the general provisions for the safety of the miners, which of course we have to observe, and I think they are decidedly beneficial. We have statutory liability for injury, etc. I do not know that I have any suggestion as to that. I think the miners are fairly well protected. Indeed, I do not know any class of labor that is better protected than that engaged in the mining industry, so far as legislation is concerned. We have a very good system of inspection in Ohio, as I understand they have in Pennsylvania and the other States, and the miner has a very fair guaranty of at least reasonable care on the part of the owners of the mine that he will be looked after and protected as much as possible, if the inspectors do their duty; and to my knowledge they always do their duty there. I know of none who has not done his work perfectly, fairly, and well.

Q. What can you say to the commission in reference to your liability laws as they apply to the miners, and laws of other States as compared with your own?—A. I really am not well enough posted in regard to the laws of other States to give an opinion on them. I do not like to express myself. I know the laws of Pennsylvania are more rigid in regard to qualifications of inspectors than our State laws are, and they are more rigid in regard to the qualifications for mine superintendents, mine bosses and inside bosses. Our laws are not so strict in that respect.

Q. Do you have check weighmen in Ohio?—A. Yes, we have check weighmen; and it is much more satisfactory to work with check weighmen than without. Of course the miners are satisfied they are getting full weight, and it avoids disputes between the operator and miner.

Q. It has been claimed at times that check weighmen, in some cases at least, are a constant source of annoyance. What has been your experience in that direc-

tion?—A. We have had none of that at all. Of course that depends largely on the character of the man appointed as check weighman. He can make trouble, and undoubtedly does in some cases. They are entirely too technical sometimes and interfere with the operation of the mine.

Q. Have you any laws regulating payments, screens, and company stores?—A. We have a law regulating the payment of wages, twice a month; and we now have a screen law in Ohio, passed by the last legislature, which compels the payment of coal before screened, that is, run-of-mine coal. This I do not consider a good law, however, and its constitutionality is now being tested; and miners by contract have permitted the operators to go on under the old system, screening the coal. My own view of this law is that it gives the poor miner a better opportunity than he ought to have of sending out refuse matter from the mine. It would have a tendency to make what we call good miners, and three-fourths of them are good miners, careless in their work, and send out slate, stone, and refuse of that kind, which would not be sold, and make our coal unmarketable. In my judgment it would be a constant source of friction between the operator and miner. I do not think there is any particular advantage to be gained by the miner in having it.

Q. When this law was passed were you working under contract with your miners?—A. Yes; the Chicago agreement was in force at that time.

Q. Did the miners adhere to their contract?—A. They adhered to the contract.

Q. That would indicate, would it not, that when miners make a general agreement they are willing to respect it at all times?—A. We found it so, yes.

Q. Is the semimonthly pay a disadvantage to the employers?—A. I do not believe it is.

Q. (By Mr. A. L. HARRIS.) Has the weekly payment law ever been tested in the court?—A. The law was passed many years ago. I believe it was declared unconstitutional in Ohio, but it was then in general force; the different trade unions had taken it up, and it had become the custom.

Q. (By Mr. RATCHFORD.) Uniformity in mining legislation is a subject upon which we expect full information from you, owing to your experience as an operator and in joint conferences of miners and operators of the several States.—A. I believe that if laws could be made of general, impartial application throughout the different States in the competitive field, that is, those States which are by proximity and location of mines necessarily competitors, regulating the production of coal and payment for mining, etc., it would be a decided benefit to the mining interests. Some States pay, for instance, for the mining by the wagon, or in districts of States, and I believe in some States almost altogether, so much per wagon. While the size of that wagon is not determined, sometimes one size and sometimes another, it makes the price per ton, which is really gauged by the selling price, so uncertain that when that coal comes in competition with coal produced in other States, which pay so much per ton definitely, one or the other is at a disadvantage, depending on which pays the most. I think if there was a certain universal rule for payment it would at least open the way for fair competition.

Q. Do you believe that a law should be enacted providing for the payment of coal by weight or measure?—A. I think by weight is decidedly the fairest way.

Q. In all competing States?—A. Yes.

Q. That weight to be arrived at after the coal has passed over the screen and given size?—A. Yes; that is my judgment.

Q. You are not of the opinion that it should be taken before passing over that screen?—A. No; I am not.

Q. That leads us to the question now as to whether or not the size of that screen should be regulated by law?—A. Yes; I think it should—the superficial area and the mesh of the screen.

Q. Would there not be some difficulty encountered there by reason of the soft and hard nature of different coals?—A. Yes; there undoubtedly would.

Q. How would you suggest that could be overcome in the price question?—A. I think one way to overcome it would be to regulate the price to conform with the screenings.

Q. On the whole, then, you believe the system of mining by measure is not a fair system, to say the least?—A. I do not believe it can be fair.

Q. In some mining States they have what the miners regard as very good legislation, and the State of Illinois, I believe, is credited now with being in the lead in that respect. Are you familiar with any recent bills that have been passed in the State of Illinois?—A. No; I am not.

Q. How would you suggest such legislation be had now?—A. I can only say it is a matter that can not be forced on the different States. I presume it would have

to be arrived at as a matter of interest to all the parties engaged in the mining industry, and I can only suggest that some representative men of the industry from different States be called and their opinions given, representing both the operators' and the miners' organizations. If they could agree on some laws of general application throughout the different fields I believe legislatures will pass them.

Q. (By Mr. A. L. HARRIS.) Under the screen system the miner gets paid only for the coal that goes over the screen?—A. Well, to all appearances he does, but he really is paid for all the coal. For instance, he is paid in Ohio at present 66 cents per ton for the screened lump coal, but if it is to be run over a screen without screening, he would only get, in the Hocking Valley, for instance, a settled rate, 47½ cents. It varies from 42 to 49 cents. He is actually paid for the coal that goes over the screen. Some miners themselves believe they are not paid for that, but on a run-of-mine basis they get as much less per ton as the proportion of nut and slack bears to the lump coal.

Q. That basis has been determined by actual experience, has it?—A. In a great many cases. In some cases it is arbitrary.

Q. Under the screen system you think you are better protected in regard to slate and refuse matter that is put into the car?—A. Yes, undoubtedly. You see if we weighed the coal before screening a miner would be entitled to be paid for everything in the car.

Q. Would you have the same right to dock?—A. Yes, we would; but there would be much more trouble of that kind. There is enough of it now. That, in my judgment, would lead to serious trouble with the miners.

Q. Would it not remove the real trouble between the operator and miner—that is, the screen—and give you the same opportunity to dock for dirty coal that you have now?—A. Well, the trouble is that we would have so much more slack, for instance. Of course that would be paid for in the run-of-mine. I am only speaking of a certain class of miners that would do this. Probably 85 or 90 per cent would not do it. We always have some men that are careless about their loading. It would make it almost impossible for us to watch the loading into the gondola car. We can not watch every mine car.

Q. When do you detect the refuse coal sent out by the miner?—A. A great deal of that is covered over—refuse matter would be covered over on the top.

Q. If it is weighed before it goes over the screen you have still the opportunity of detecting the dirty coal that goes into the car?—A. Yes, we have; only there would be so much more we could not get at it before it was shipped off.

Q. As I understand it, in Illinois they have adopted the run-of-mine system, and it is working very satisfactorily to both operator and the miner. As the screen is the bone of contention, would it not be well for the miners and the operators to get together in Ohio upon that question?—A. I do not believe that it is really so much a bone of contention as some miners and some others have led the public to believe. It never came up particularly until the Chicago agreement, and then the Illinois operators and miners brought it before the convention. I do not know whether they are satisfied with it there; only I think they have a reasonable basis for payment of run-of-mine.

Q. Is there any one question in Ohio that causes more friction between operator and miner than the screen?—A. We never have had any friction at all until very recently on that question. We have had friction on the size of the screen and the mesh of screen, the shape of the screen bars, but never very much friction upon the question of run-of-mine payments. I think they do now generally want to be paid on the run-of-mine basis.

Q. Does the screen get out of fix often?—A. I think not. I believe it is generally kept in pretty good repair. It is the duty of the miners' check weighman to watch the screen.

Q. Are the meshes kept clean?—A. The miners' check weighman looks after that.

Q. If meshes get wider and the larger coal drops through, the operator does not lose it; he sells that as nut coal?—A. Yes.

Q. How many grades of coal do you make in Ohio?—A. The usual grades are lump, three-fourths, run-of-mine, slack, pea coal; then they have combined nut and slack. There are about 6 or 7 different grades of coal.

Q. What is the difference in value between the nut coal and the lump coal?—A. As a rule, 40 to 50 cents; in the Massillon district, 15 and 25 cents.

Q. What is the difference between nut and pea coal?—A. About 15 cents.

Q. Is it a fact that the retail dealers in many parts of Ohio often sell the nut for the same price as they sell the lump coal?—A. I have no knowledge of that.

Q. Are not stoves and grates constructed now especially for the purpose of

burning nut and pea coal—I mean base-burners?—A. I do not believe very much nut coal is sold for domestic uses in Ohio homes. A few years ago we sold a large part of the Massillon nut coal for that purpose, but for the last 3 or 4 years these stoves have not been nearly so much in use in Ohio as before. We have quite a difficulty selling our nut coal.

Q. Is your coal different from the Youghiogheny Valley coal?—A. Yes.

Q. Does it run together like the Youghiogheny?—A. There are two classes of coal in Ohio that do not "run;" they burn very much the same—the Jackson coal and the Massillon coal. They are both dry-burning, free coal.

Q. (By Mr. RATCHFORD.) What can you say on the subject of machinery?—A. I have no personal knowledge of the use of machines, but I have gathered some information on the subject with a view to putting machines in the mines. I find that where the price of mining is low there is no particular advantage in having mining machines. For instance, the price of mining was 3 years ago down to 45, 51, and 56 cents. There was no particular advantage in machines when the price was down to that. It was probably cheaper to mine by picks than machines at that time; but as the price of mining advances, then the value of machines becomes more apparent, and at the present basis mining machines are worked profitably in a large number of mines in the State. They save, as I am told, from 12 to 21 cents per ton in producing the coal.

Q. (By Representative OTJEN.) Do these mining machines displace any number of miners?—A. Yes; they necessarily displace a great many miners. Of course they have to have a number of men as loaders and machine operators.

Q. Do you know about the number of machines that are being used in Ohio?—A. No.

Q. How long ago is it since they began taking in these machines?—A. They began as long as 15 years ago. They were more experimental then than anything else. It is only within the last 5 years that they have been used so generally as now. Competition became so strong after West Virginia coal began to seek the market in Ohio and throughout the Northwest that it was necessary to find some means to equalize prices with that district, and consequently the larger mines, where they could find it profitable, equipped themselves with machines in order to cheapen the cost of the coal.

Q. In the mines you are connected with you do not use any?—A. No; we find it more profitable to pick-mine in the districts we are interested in. In our Massillon district the coal is mined rather differently than in most sections. There is very little undercutting. The coal is blown right out of a solid wall, so there the machines would not be of so much advantage. Since the last advance of 10 cents per ton to the miners we have suffered a reduction in our selling price of not less than 10 per cent. That has been because the West Virginia fields have been developed to such an extent, and have produced coal so cheaply that we could not obtain a higher price for our product in Ohio, nor in Pennsylvania or in Illinois. We have given not only 10 cents advance in mining, but really have suffered a reduction in selling price, and the only way I can see any remedy for it is for the miners' organization to extend itself and take in West Virginia; then an equitable rate of mining could be fixed for all States, West Virginia in line with the rest, and all the States would then be on a fair competitive basis.

Q. (By Mr. FARQUHAR.) If these workmen are not receiving such wages as workmen ought to have, and they ask or demand 10, 15, or 20 per cent more, and are successful in getting it, by strike or otherwise, where would the burden fall? Is it going to come out of the mine owner, the transportation company, the sales agent, or will it ultimately come out of the consumer?—A. Under ordinary circumstances it would certainly ultimately come out of the consumer; but at the present time, judging from the experience of the past 2 years, it would be suffered entirely by the coal producer.

Q. Would not get anything out of the transportation company?—A. No; nor the sales agent would not take it out of the consumer.

Q. (By Representative OTJEN.) Will you please explain the labor-saving machines that are used in the mines?—A. The only labor-saving machine of any consequence is the cutting machine, which does the work in the mine of undercutting coal or in side cutting, chiefly in undercutting, and the electric and compressed air drills, which do the work of the hand drill of the men.

Q. Are they worked by steam?—A. No; they are worked by compressed air or electricity. Electricity is the agent now chiefly employed in the mines. The compressed-air machine and drill were used before the electric machine was introduced. They were used, I think, as much as 20 years ago. That was called a punching machine. The electric machines now in use cut the coal.

Q. And is that called the undercutting machine?—A. They simply call it the

cutter, but it is really undercutting. The miner calls it, technically, undercutting.

Q. There are really, then, but two kinds of machines that are labor-saving machines in mines?—A. Only about two that will amount to anything.

Q. Are there any improvements in hauling the coal away from the place where it is mined?—A. Yes; there is an electric haul which is capable of hauling several cars, and saves some drivers; but that is very slight compared with the number of men thrown out by the cutting machines.

STATE OF OHIO, *County of Wayne* :

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

W. J. MULLINS.

Sworn and subscribed before me this 14th day of August, 1899.

ROSS W. FUNCK, *Notary Public*.

WASHINGTON, D. C., *May 5, 1899.*

TESTIMONY OF MR. DAVID ROSS,

Secretary Illinois Bureau of Labor Statistics.

The commission met at 2.15 p. m. Vice-Chairman Phillips presided and introduced as a witness, Mr. David Ross, secretary Illinois Bureau of Labor Statistics. The topical plan of inquiry on mining was followed.

Q. (By MR. RATCHFORD.) Please state your name, residence, and official position.—A. David Ross, Springfield, Ill.; secretary of the State bureau of labor statistics. The Illinois bureau is organized on somewhat different lines from those of other States. Under our law a commission of five individuals, representing different industrial interests, is appointed by the governor, and that commission elects a secretary, who is not a member of the commission; and upon the secretary devolves substantially the same work as is performed by the single commissioners in the other States having labor bureaus. The statistical work proper is substantially along the same lines.

Q. How long have you served in that capacity?—A. I was appointed by the commission on the 1st of April, 1897.

Q. Prior to that time what was your business?—A. I was employed in the practice of law for about 3 years prior to April 1, 1897.

Q. Have you had any connections, at any time, with any trade organization of your State?—A. Yes; I have been, and am yet in fact, a member of the coal miners' organization. I went into the mines when I was 9 years of age, in the State of Illinois, and worked in them continuously until my election to the legislature in the fall of 1888. I have held no official position, however, in connection with the organization, except being a member at one time of the State executive board.

Q. What can you say to the commission as to the constitutions and regulations of that trade union or other trade unions in your State, with reference to funds, benefit features, etc.?—A. Many of the constitutions of the trade unions provide, of course, for benefits. The miners' organization has been rather handicapped by reason of the peculiar conditions heretofore existing, until recently. In the State of Illinois a defense fund was created for the purpose of maintaining the members on a strike or who have been locked out. Our State organization has raised during the last year and a half a little over \$200,000 for that purpose; about \$140,000 has been expended, leaving a surplus in the defense fund of a little over \$50,000. The first necessity for the expenditure of defense money originated at Virden, Ill., where the miners had been locked out by the employers, and, by the way, that event has become important history, not only in the State of Illinois but in the industrial centers of the entire country. I may state, if it is in order, that the cause of the disturbance there was due to a failure on the part of the mine owners to recognize the jurisdiction and authority of the interstate organization of miners and operators created for the purpose of fixing or agreeing upon mining prices. The operators at that point denied that the convention had the power to fix a rate for that field and claimed that the rate fixed was excessive, and that it could not be paid, and after having submitted the case several times to arbitration,

after having agreed to abide by the decision of the board, all those agreements were repudiated by the company and the miners were locked out, so that most of the fund went to support those miners and their families while locked out, and the balance of the \$140,000 was spent and is being spent at another point of the State, where a similar situation exists—at Pana, Ill.; they have entered on their thirteenth month of the strike or difficulty at that point.

Q. (By Mr. FARQUHAR.) You say at one time the operators at Virden had virtually agreed upon the arbitration and afterwards broke that agreement?—A. Yes; they agreed in writing with the representatives of the miners at that point that they would abide by the agreement of the State board of arbitration, and the miners and operators united in a request that the board should intercede; and the board confirmed the rate fixed for that field by the interstate convention, and the mine owners declined to pay it, and as a means of resisting that decision sought to import labor from the Southern States, much of which was of the criminal kind.

Q. You mean convicts?—A. Yes; men who had learned the art of mining in the convict mines of the South. After having repudiated these agreements repeatedly they served notice on the governor of their intention to bring labor into the State of Illinois, and if necessary, at the point of Winchester. The governor advised against that policy, and of course his advice was not heeded, and they did attempt to bring a trainload of negroes into the State of Illinois and disembark them at Virden under the protection of Winchester in the hands of men who were not citizens of our State. Governor Tanner construed that policy as a declaration of defiance to the power of the government of Illinois, and called their attention to the fact that even a neighboring State could not move its militia across the soil of Illinois without first obtaining the consent of the governor, and that he would not permit the invasion of an armed mob of that kind, and he did not. A little later on the difficulty at Virden was adjusted. The coal companies agreed to pay the rate of 40 cents fixed for that field, and are paying it now. The suspension at that point lasted about 7 months.

Q. Was that reached by a compromise?—A. Yes; the compromise constituting the basis of the settlement was the tearing down of the stockade which the corporation had constructed during its trouble, and the dismissal of some of the more offensive members, to all of which the company agreed, and work was resumed at the union scale.

Q. Then the local miners did ultimately accept part of that contract labor that came into the State in making the compromise?—A. No; the contract labor was not disembarked at all. It was taken out of the State.

Q. (By Mr. KENNEDY.) Disembarked them at Springfield?—A. No; they ran them right through to a little place called Williamsville, about 6 or 8 miles on the other side of Springfield. From there they were taken to St. Louis and distributed to different points.

Q. Did any of that labor ultimately go to Indian Territory or any other place where strikers were out?—A. Some of the negroes at the other points have been distributed in the Indian Territory, but those causing the trouble at Virden, as a result of which several lives were lost, were distributed from St. Louis and went South and farther West.

Q. Could you state whether they were citizens of Illinois who went down there to make contracts with the people in Alabama?—A. Yes; representatives of the company.

Q. Did they have someone on the ground who massed those people together there?—A. They had an agent there who massed them together, but they were obtained at the solicitation of the Virden Coal Company, citizens of the State of Illinois.

Q. (By Mr. FARQUHAR.) During all this trouble did the operators who agreed on the scale and maintained the scale support the action of the union miners at Virden?—A. Yes; to the extent of favoring the enforcement of the scale at that point.

Q. So there was no discrimination among those who had agreed to the scale, whether operators or workmen?—A. None whatever. They appeared before the State board of arbitration as witnesses against fixing the rate for that field different from any rate that had been fixed upon. I would state, by way of explanation, that there has been a great deal of misrepresentation and a great deal of misunderstanding concerning the action of the governor of Illinois in acting in the manner that he did. Some have represented him as meaning that he had the right to deprive a man of the privilege of contracting for his labor. That problem, together with the color question, never entered into the industrial difficulty at Virden. What the governor did object to, and what he had the right to object to

under the constitution of the State of Illinois, was the method and manner by which those men were brought into the State. The right to employ labor is a right guaranteed by the Constitution of our country, and it can not be taken away by anybody. The distinction was that those men who were brought into the State of Illinois were an undesirable class of citizens in the first place; they had received their education as miners largely in the convict mines of the South and in addition to that, they were brought in under the protection of an alien mob of policemen contrary to the spirit and intention of our law. It was considerations of that kind which induced the action taken at the time, and which resulted in effecting a satisfactory settlement.

I presume the commission is as familiar with the question of trade unions as I possibly can be. Trade unionism proper dates back several centuries and has, in my judgment, stood for, and it represents, a conviction in favor of the advance of mankind. It has protested against many abuses and has, in a perfectly legitimate and lawful way, succeeded in removing many of the grievances of which the members of the industrial army had just reason to complain.

Q. Can you state anything as to its growth within your State?—A. The work of organizing the different tradesmen of Illinois—in fact, of the whole country, has been very significant during the last year or two, and also very successful. It has been the experience heretofore that in times of renewal of trade and business organization has declined. It is a significant fact that in all the great industrial contests of the country the most bitter opposition and fight has been put up at a time when the craftsmen were less organized. That would seem almost anomalous, yet it is a fact. There has been this exception, however, to that tendency during the last few years, in which the trade of the country has revived considerably and prices and wages have advanced, yet the work of organizing the different tradesmen instead of relaxing has, if anything, been encouraged and renewed. Efforts have been made to perfect and strengthen the organizations, so that in the State of Illinois to-day there are more members of the different industrial pursuits who are members of labor organizations than ever before in the history of the State. That is particularly true concerning the coal miners. I presume 40 per cent of the coal miners of this country have been recruited from some of the poverty-stricken districts of Europe in the years gone by, and corporations contracted for that kind of labor and brought it over here, and as a result the general work of organization until recently has been seriously handicapped. The difficulty has been to reach that class of people. Most of them are strangers to the English tongue, and most of them come from countries where the standard of living is so much lower than it is in the United States, that they were willing to assume places at a much less rate of compensation than the native miners of this country. There seems to have been, however, a somewhat vindictive reaction among that class of men in the mines. Within the last year or two they seem to have realized the purposes for which they were brought here and they have almost to a man become members of the organization in Illinois and other States. Out of 35,000 men employed in and around the coal mines of our State I dare say that 30,000 of them are members of the United Mine Workers' Union. That work has been accomplished within the last 16 months in the State of Illinois.

Q. (By Mr. RATCHFORD.) What have you to say of the feasibility and legal effect of the incorporation of trade unions?—A. The sentiment, as I find it in the industrial centers of the country, has not been favorable to incorporation. The leaders of the different trade unions seem to have paid no attention to the matter at all. Of late years the question has been considered, but the matter has not been given that attention which its importance merits. I have always favored the incorporation of trade organizations for several reasons. Not only would it give the organization corporate standing in the courts in legal matters, which is a very important thing, but it would at the same time, in my judgment, encourage the work of arbitrating differences between employers and employees. In my individual experience I have found, during industrial contests, where employers refused to arbitrate, it was because of the fact that the other side represented a miscellaneous and irresponsible mob; that liability could not be located; that they were not responsible. I think that general incorporation would have the effect of encouraging the idea of arbitration and would correspondingly reduce the number of strikes and labor disputes.

Q. What would be the effect of incorporation with regard to disciplining the members of trade unions?—A. I think the effect would be good if the idea could be impressed upon the minds of the members that, being under an incorporated act, they were responsible in a legal sense. The result would be to encourage and increase discipline and the control of these people.

Q. Would they be responsible for violation of contracts by money damages, or responsible in what way?—A. The nature of the liability would have to be determined. I have heard no complaint of the failure of any labor organization or its members to respect its contracts, and I would anticipate but very little difficulty from that source.

Q. (By Mr. FARQUHAR.) Would it not be a good safeguard on all your funds?—A. That would be another reason why it should be taken advantage of.

Q. (By Mr. RATCHFORD.) What are the relations of combinations of labor to nonunion labor?—A. Of course, as an object lesson, the organization would encourage the joining of other members.

Q. (By Mr. FARQUHAR.) Are nonunion men allowed to work in the mines where union men work?—A. Certainly; there is no prohibition, except in some rare instances where we have had some difficulties; but, as a general proposition, they recognize the right of a man to be a member or not, as he elects. Of course, they prefer to have him in the organization, and would do everything to encourage him to join.

Q. (By Mr. RATCHFORD.) Where the organization of your trade is complete at any mine, the employer enjoys the right to hire whom he pleases?—A. That right is not disputed.

Q. If a nonunion man is employed, does a committee of your organization go to him and request him to join the union?—A. That is the policy.

Q. In case he refuses to do so, what is the general course?—A. We have had a great many strikes in the State of Illinois on account of men refusing to join the organization; that is, local strikes.

Q. Are those strikes countenanced or encouraged by the general head, or is it purely a local matter?—A. Mostly local grievances.

Q. Do you know of any action or resolutions adopted by your State or national organization encouraging those things?—A. No.

There are several causes that lead up to strikes. The experience of the labor leaders, men who have been actively engaged in the organization of labor, has been that strikes are most frequent just after men are organized. The history, of course, has been that the older the organization the more disciplined its members become, and the less liability there is for interruption of work. I mean any misunderstanding between members and employers. Strikes in most instances are caused by demands for increase in wages or resisting reductions in wages. Those I presume are the most prolific disturbances in factories, mills, and coal mines. There have been strikes, local strikes, on account of failure or refusal of the employer to recognize the union, or to recognize a committee of the union, or to comply with a request of the union for the discharge of some men. Those and other minor causes have contributed to the number of strikes. With, however, the development of the union there comes a better understanding between the members and the employer, and these causes or troubles are removed largely, so that it is rare indeed that we have strikes except for advance in wages or in resisting reductions.

Q. Are the miners more or less liable to strike than are the men in other trades?—A. I do not know that they are, as a general thing.

Q. Is there any peculiar condition met in your trade that can not be foreseen, which is liable to result in strikes, and which is not met with in other trades? The screen, for instance; it has been said by other witnesses that the screen is a very prolific cause for strikes, because it very often gets out of adjustment.—A. We have had that trouble, but it has been largely removed by reason of the new system.

Q. Have you a new system in your State?—A. Yes; by agreement miners are paid for the product on a basis of what they call the "gross weight."

Q. That is, weighed or measured without being screened?—A. It is weighed before the product is screened. It makes no difference to the coal miners in Illinois how large the screen may be, under the present method.

Q. How was that system brought about?—A. That system was brought about as a result of this organization of miners and mine operators, embracing the States of Illinois, Indiana, Ohio, and Pennsylvania. It was done as a result of joint convention—mutual agreement between the operators and miners.

Q. Is that system a satisfactory one now, so far as you know?—A. Yes; it is very satisfactory.

Q. What are the economic results of strikes and lockouts?—A. My judgment is that strikes and lockouts are a disaster, that the community must have occasion to regret the cause that operates to produce an interruption in employment; from that point of view, the strike and lockout is an evil. Nevertheless, they are a necessity at times, and where important principles are involved the result has been beneficial to the members and also the general public.

Personally I have never taken very much interest in the system of boycotting. We had so much of it during the régime of the Knights of Labor in this country. So many different articles were placed under the ban of that organization that most of the members of trade unions did not know what was and was not boycotted. I question also the power of the boycott as it has been exercised in the past. It is a very difficult matter for the members of organizations who have a grievance to prohibit the purchase of some article that everybody uses.

On the subject of the blacklist—of course, I have no sympathy with that. Every good citizen ought to be opposed to the blacklist. The blacklist is more effective than the boycott, for the reason that you can reach the producer, and you can not in every case reach the consumer of the product. There is that distinction between the blacklist and boycott. If there is any legislation that could be enacted concerning the blacklist, it should be adopted at once.

Q. (By Mr. FARQUHAR.) Your opinion is that both the boycott and blacklist ought to be abolished?—A. Yes.

Q. (By Mr. RATCHFORD.) What have you to say of conciliation, mediation and arbitration?—A. Under our law in the State of Illinois, notwithstanding it has been and is yet very imperfect, we have accomplished a great many good things, not so much in the way of arbitration, but in the way of mediation and conciliation. Strikes have been averted by reason of the kindly intervention of the members of our State arbitration board. We find, however, that under our present law it is entirely too voluntary; that was our experience with it in the places where trouble could not be evaded by conciliation and mediation, and where arbitration was offered and refused. We found there was nothing in our present law that would enable the arbitrators to get at the facts. For instance, there is a provision in the law authorizing the board to issue subpoenas for the attendance of witnesses, but no power to punish for failure to attend, and the result was in all these instances where the situation became aggravating, where a strike came on, that the witnesses sometimes refused to appear, and treated the subpoenas with contempt. The same objection applies to the provision authorizing the subpoena of a witness, clerks and other persons having charge of the records of corporations. At the late session of the legislature in Illinois some important amendments were made to our law. One is that where an employer of labor and the employees agree to arbitrate a trade controversy, the decision of the board will be final, and that the award will have to be complied with, and that if either party refuses to comply with the award, then the fact of such refusal can be certified to and an order issued for punishment as for contempt. The punishment, however, does not include imprisonment. The other part of the amended act requires the attendance of witnesses and also the production of books. It is thought and felt that while the law is voluntary, so far as ultimate results are concerned in the case of trouble, the effect of the publication of facts to which the members of the board will have access under this amendment will be to encourage people having troubles to go before the board, and that it will result in the satisfactory settlement of a great many disputes.

Q. (By Mr. FARQUHAR.) How many members compose the board?—A. Three.

Q. Is the board nonpartisan?—A. Yes. One member of the board belongs to the opposite party from the party in power; the others are of the same political faith as the appointing power.

Q. Any labor representative on the board?—A. Yes; we have a labor representative.

Q. Appointed as a workingman?—A. Appointed as a workingman—appointed because he represents the trade organizations.

Q. (By Mr. RATCHFORD.) As nearly a nonpartisan board as could be made up?—A. Substantially so.

Q. What is your judgment on arbitration by joint committees from the associations involved in a dispute?—A. We have had some experience in that way in the settlement of disputes. In many instances we find that the employer or, in some instances, the employees do not care to submit their case to the State board of arbitration, but are in favor of arbitration in that way—joint committees representing employees and employers. Of course the principle is just as effectively applied in that way as under the State law.

Q. Which plan do you regard as being the most efficient?—A. I would be inclined to think that the State plan, carrying with it the authority of law, would probably exercise a better influence than the other, although both are capable of accomplishing a great deal of good.

Q. Do you believe that the State plan should be made compulsory on both parties?—A. I have always opposed the principle of compulsory arbitration until, I will be frank to admit, the recent labor disturbances in the State of Illinois. I

had occasion to oppose in the public press the views of a distinguished trades unionist on that question some few years ago. He took the position that compulsory arbitration was the right and proper thing, and I took issue with him. I have had no reason to change my opinion on that subject, except incidentally in connection with the labor troubles in the State of Illinois. It seems to me that the community has some rights and some interests, and that their privileges should not be destroyed by reason of the failure of the employee and employer to come to some agreement; and that where it involves the credit and honor of the State; where it means the breaking up, as it has in the city of Pana, of homes and families, separation of members of churches, and destruction of several prosperous business houses; where it has cost the State of Illinois and the county of Christian more money than would have paid the wages of the miners employed at Pana the union scale; where that state of affairs existed for about 13 months, it has inclined me to the opinion that there ought to be some legal force applied to effect a settlement under a condition of that kind. Otherwise, on the general plan as to compulsory arbitration, I would have to be opposed to it.

Q. Do you believe that if you had had compulsory arbitration there this trouble would have been avoided?—A. Never would have occurred.

Q. If the organizations of employers and employees had been incorporated under the laws of the State, would it not also have been avoided?—A. I think so.

Q. What have you to say with reference to the injunction in strikes?—A. I take the same view of the injunction as I would of the black list. I consider that the injunction, as a means of punishment, is unfair; that it operates, has operated, and will, if applied in the future, tend to operate in defiance of the rights of our citizens. It is a system that gives into the hands of one man entirely too much power. It is a method that contemplates and seeks to prevent the violation of law, and punishes the man who might be guilty of violating the injunction without trial of a jury of his peers. I am decidedly opposed to the injunction in strikes. I believe it is perversion of the law. The law of injunction was never intended, in my judgment, to apply in the way that some of our judges have applied it in labor disputes.

Q. (By Mr. A. L. HARRIS.) Has it not been the abuses largely of the right of injunction that brought it into disrepute?—A. It is that especially, of course, against which I protest. Of course the law of injunction, applied as it was before these labor troubles occurred, was a necessity. It is simply its application in that way that I object to.

Q. (By Mr. FARQUHAR.) Do you have any objections at all to the operation of temporary injunctions? Do you not think that it is fair for a community to have on its statute books a law authorizing temporary injunctions in case of these troubles, whether with laboring men or any other?—A. As a proposition in law there is no objection to it.

Q. (By Mr. RATCHFORD.) Have you ever known where an injunction served the purpose for which it was particularly intended, the prevention of a crime?—A. My judgment is it has not; its purpose has invariably been defeated and it has failed to accomplish what it was designed for, so far as it relates to labor troubles.

Q. State what, in your judgment, are the proper terms of payment of wages.—A. We have had a considerable amount of agitation of the wage question—that is, the payment of wages in the State of Illinois. Several years ago appeals were made to the legislature and they invariably complied with those appeals, and laws providing for weekly wages were passed, but upon their being taken to the supreme court they were invariably declared unconstitutional. That was true not only of the law requiring the screening of coal and regarding truck stores, but also in regard to the time at which wages should be paid. All that class of legislation was declared unconstitutional by the supreme court of our State. However, the sentiment created by that agitation and that legislation helped to secure the very object of the laws; for within the last few years there everything that was sought in that way has been accomplished by mutual agreement. That is to say, the screen question, as far as our mining industry is concerned, has been removed by agreement between the miners and operators, and the custom of paying every 2 weeks has become quite general throughout the mining districts of Illinois; and in the truck-store system, which we sought to destroy by law, many of its worst features have been removed, so that the evils complained of by the miners some years ago have been minimized, so far as my observation goes. I take the position that the more frequently the wages are paid the better it is for the employees, and I do not believe it involves very much of a hardship on the employer. When this matter was being discussed, the point that was most frequently referred to, especially by some of our employers of labor in Illinois, was that if the workmen were paid wages every week or semimonthly it would mean

much lost time from the service; that it was the custom for the employees to become intoxicated on pay days, and that they lost time in that way, and they supposed with more frequent pays there would be more drunkenness and more lost time. They opposed it on that ground, assigning that as a moral reason why the period between pays should be increased rather than diminished. I am glad to say, however, that thus far their apprehensions have not been realized; that with the frequency of our pays has come a better condition among the wage-earning class. There is no noticeable increase of drunkenness and certainly the record does not show there has been any increase in lost time by reason of that system.

Q. Is it an advantage to the worker to receive that pay more frequently?—A. No question about it.

Q. Laws relating to screens, stores, and terms of payment having been declared unconstitutional by courts of your State, could you state in general terms why they were declared unconstitutional?—A. The law passed by the legislature abolishing the truck system, and the one providing for the weighing in gross of the miners' product, and that providing for the payment of wages every week were declared unconstitutional by our courts for the reason that they denied or prevented the exercise of the right of liberty of contract.

Q. (By Mr. FARQUHAR.) Under the claim that it was class legislation?—A. That question was not particularly considered in the opinions of the court.

Q. (By Mr. RATCHFORD.) If the employers within a year or two thereafter conceded to the demand of the miners and with them made a mutual agreement, giving to them all that those laws contemplated giving, wherein is the justice of declaring them unconstitutional on those grounds? How is it a denial of the right of liberty of contract if the employing classes are willing to concede it?—A. It was the mutual act of the employees in harmony with the mutual act of the employers that led up to these changes. To attempt the same thing by statute was to substitute, as the court held, the will of the legislature for that of the contracting parties. On those grounds it was declared invalid.

Q. (By Mr. FARQUHAR.) Have you in the State of Illinois a law declaring that wages shall be paid in bankable currency?—A. We have a law providing for the payment of wages in currency of the United States. That has never been in question at all.

Q. Did not that insure the abolishment of truck stores at once?—A. It has not had that effect. That law has been passed on indirectly by our own courts. If it ever came to an issue I have no doubt the courts would rule it out.

Q. It stayed in force since July 1, 1895?—A. Yes.

Q. (By Mr. RATCHFORD.) Sliding wage scales; the living wage; what have you to say on these subjects?—A. I have never had any experience with the system of sliding scales. The work in which I was formerly engaged was fixed by a yearly contract providing for a specific amount of wages. I think, however, that in the industry where the system obtains it is operated successfully, especially in connection with the minimum wage scale; that the common suspicion of the sliding wage scale among workingmen generally is that it slides only one way; but a scale based on a minimum wage, below which it can not go, and providing for an adjustment in case of the advance of the product is all right. The living wage—the term is not altogether clear. I presume what is meant by living wage is the standard that the laboring man should be able to maintain; that the wages received for his labor should be sufficient to not only furnish all the necessities of life, but some of the luxuries as well.

Now, we have the system of store orders in Illinois. I said a moment ago that the law prohibiting the truck system had been declared unconstitutional, but that the more objectionable features of the old truck system, so far as they affect the mining industry of the State, have been largely removed. The truck store is the product of industrial isolation. You find the truck store removed a distance of 3, 4, or 5 miles, in some cases, from the provision stores of the city, and it was a convenience in one sense; but the impositions and exorbitant prices of certain stores made them an unqualified evil. However, with the growth of industrial communities, particularly as applied to mining towns of 10,000, 15,000, or 20,000 population, they were required to meet the prices fixed by other stores, so that on the point of rates between the truck store and the ordinary provision store the difference is not much, if any.

Q. You were speaking in that connection of the miners in your State?—A. Yes.

Q. Is the truck store a greater or less evil in other mining States, so far as your knowledge goes, than it is in the State of Illinois?—A. In a general way, I know that many of the abuses that were practiced in the State of Illinois 10 or 15 years ago in connection with truck stores are being practiced in some States yet, and that in those cases, of course, it is a decided evil.

Q. What do you attribute the change to in your State?—A. I do not know specifically what has caused the change, aside from the growing up of these mining towns that were merely hamlets 10 or 15 years ago into good-sized cities, and recent organization that has been formed among the men. That has formed a part, in fact, of some of the contracts made for mining; the prices for supplies have been regulated and reduced in that way by agreement.

Q. (By Mr. FARQUHAR.) In that arrangement between operators and yourselves do you have any specific agreement in respect to these truck stores?—A. No, not specially, except as it applied to supplies of oil and powder and articles of that kind that were used in the business.

Q. Not general provisions?—A. No.

Q. (By Mr. RATCHFORD.) Do you regard the truck store in almost any case, if not in every case, as being a necessary adjunct to the mine?—A. No; I do not.

Q. Do you regard it as being in any way beneficial to the trade from the standpoint either of the miner or operator?—A. No; I think the effect of the system has been detrimental. Supplying the necessities of 300 or 400 or 500 men from one common company store has in the past netted an immense revenue to the corporations. This has in some cases been used as a means of underbidding their competitors, with its consequent effect on miners' wages.

Q. Has the miners' organization at any time adopted resolutions in regard to truck stores?—A. Always.

Q. Is it or is it not a fact, as is the case with the injunction, that it is the abuse, the exorbitant prices, the unjust practices in the company store, that the miners have always protested against, and not the principle of keeping a store?—A. That is undoubtedly true.

Q. Fines and penalties; mine tenements; have you anything to say on either of these?—A. There is the same objection to be urged to the tenements as to the store—that is, the system—the principle is wrong. In the centers where they have these tenements they remind one very much of the slave cabins of the South. There is entirely too much uniformity. The principle of paying out wages with one hand and receiving profits from the same class with the other is bad. The tenement, like the truck store, may prove a local convenience, and where the system is not abused of course it can be tolerated. Where mines are isolated the tenement becomes a necessary part of the mining plant.

Q. Could you state in general terms what the wages were before and after the coal-miners' strike of 1897?—A. Wages, as a result of the suspension in 1897 and the joint agreement with the mine owners, were advanced during that and the following year about 30 per cent. For instance, in the Springfield district in October, 1897, when the suspension ended, the prevailing mining rate was about 30 cents, some places 32 cents, some places 28 cents, so that the prevailing rate was 30 cents a ton. By virtue of the agreement reached on the 1st of October it was advanced to 37.7 cents, and then the agreement reached at Chicago one year later put it up to 40.7 cents. That agreement went into effect the following April, so that the mining advance in that field was equivalent to about 36 per cent. In other sections of the State of Illinois, notably in the southern part, the advance amounted to, in one instance, a little over 100 per cent. The report which we prepared, relating to the suspension and the result as reflected in an increase wage scale, has been circulated, and a copy can be furnished the commission. I will be glad to furnish it.

Q. Relative rates of wages; relative social condition of labor, during the past 50 years; and influence of organized labor on wages; what have you to say on those three topics?—A. The relative rate of wages, considered particularly in connection with the purchasing power of wages, which is an important factor, has materially increased, not only during the last 50 but during the last 35 years in the United States, and, of course, with the increase of wages there has gone on an increased social condition; one is the complement of the other.

The influence of organized labor on wages; while the influences governing the question of wages are many and varied, there is no question about the effect of organized labor in maintaining and advancing wages. Much of the increase in wages that has been obtained during the past few years has come about as the result, not alone of the improved market conditions in the United States, but somewhat from the effect of the power and influence exercised by the organized labor of this country. You invariably find that where there is an absence of organization wages are lower, even in the same city or in the same country; that among the immediate and visible effects of labor organization is an advance, not only in the rate of compensation, but also in the social condition of the workers themselves.

Q. (By Mr. FARQUHAR.) Is it not also a fact that that leads to more stable, more continuous employment?—A. I think there is no question about that.

Q. (By Mr. RATCHFORD.) Take up the question of employment: increased or decreased number employed. Have you anything to say on that?—A. I have some decided opinions on that question. There is a common impression among a great many of our pretty well informed laboring men in this country that a valid reason for opposing the introduction of machine methods of production was on account of the fact that it decreased the number of the employed, and that it added to the army of the unemployed. I look at it from this view point, that there is more machinery employed in the world to-day than ever before and that there are more hands employed at the same time; that the number employed is greater relatively now than ever before, and that that increase has come in a large measure through the invention and application of labor-saving machinery. I do not know of a better illustration of that fact than in the printing press. This has been perfected to such an extent that the Hoe printing press, which is used to-day for the printing of our metropolitan newspapers, can turn out in 12 hours as many copies as the labor of 5,000 men could under the primitive hand system; and yet, strange as it may seem, there has been a very material increase in the number of printers employed in the United States. That result has been reached largely through the fact that changes caused by the introduction of machinery have created a demand for the products of the machine; that by the economy of that process the price has been reduced; everybody can now buy newspapers. Not only has it exerted its influence in that way in increasing the number of men who are profitably employed and also reducing the cost of the product itself, but there have been a number of new industries created as a result of these changes. There is the institution of bookbinding, the manufacture of paper, and other tributary industries to that of the printing press. So that the effect of the machine, instead of diminishing the number of employed, has ultimately increased it. What was considered a displacement and what was really a displacement temporarily, as the result of the invention of the machine, was in fact simply a rearranging; and ultimately the effect and result has been, and is, not only to give employment to an increased number of men, but also, incidental to that, at an increased rate of wages, and incidental to that, at a reduced working day.

The average number of days employed during the year varies in different industries. It will average in the mining industry of Illinois about 175 or 180 days under normal conditions. Last year, of course, the record shows a decline, but that is explained by the fact that about 4 months of the year for which this report is made the miners were not employed. In the other industries it varies, I presume, all the way from 275 to probably 300 days.

Q. (By Mr. FARQUHAR.) What do you say about the shorter workday?—A. I am an enthusiastic advocate of the shorter workday; I have always been.

Q. (By Mr. RATCHFORD.) What have you to say with reference to the employment of children?—A. In our State, in the mining industry, of course, the limit is 14 years; fixed by law.

Q. Is it observed generally?—A. Yes; the law is pretty generally enforced.

Q. Whose duty is it to enforce it?—A. It is the duty of the State mine inspector. I do not know of any infractions of the law. The difficulty of enforcing the factory law regarding the employment of children is greater. I understand, from my conversations with the chief factory inspector of Illinois, that fully one-fourth of the time of the deputies of that State is employed in prosecuting violations of the child-labor law.

Q. (By Mr. FARQUHAR.) Do you think that the State of Illinois is as far advanced as other States in respect to factory legislation and general labor laws?—A. I do not think that Illinois is very far behind even Massachusetts in the matter of its labor legislation. Of course, we had the advantage of them in one respect. They manufactured the legislation and we in turn adopted it, so that it has been substantially along the same lines. In the factory act of 1893, the main provision, regarding the employment of women and regulating the time during which women may be employed, was declared unconstitutional by our courts for substantially the same reason that they declared against the semiweekly law and the screen law and other things of that kind—because it denied the women the right to make private contracts. If that provision could have been maintained and the law enforced, it would have gone a long way toward correcting and removing the evils of the sweat shops in the city of Chicago.

Q. Is there anything in the constitution of the State of Illinois that limits or does not permit this legislation that other States have?—A. The courts have construed the constitution to include that class of legislation usually as class legislation, and also as interfering with the right of private contract. The only class that the constitution mentions for legislation is the mining industry. That is provided for specifically in the constitution.

Q. What have you to say in general on immigration?—A. I have always felt that the subject of immigration was an important one, and that there was a pressing necessity during the last 10, 12, or 15 years for its regulation. I think the Fourth of July orator is responsible for a good deal of the trouble we have invited to our shores. It is not so bad now as it was some time ago, but there was a time when we were getting a class of people that the institutions of this country could not very well assimilate. They have been factors in a great many labor disturbances in this country, and while that current has been somewhat shut off or somewhat checked, we are still suffering from the results of that bad, wide-open policy in regard to immigrants, especially from southern Europe.

Q. Can you suggest any remedies for it? What restrictions do you propose, educational, or in what way?—A. The question has been of great interest to many of the members of the different industries of this country, and the suggestion of absolute prohibition is quite popular in many sections.

Q. (By Representative GARDNER.) Now, considering the matter as a purely national consideration, and that is all there is of it, as to any particular trade, would it or would it not seem more national and patriotic to limit immigration as long as sufficient labor for that trade was furnished, present and prospectively, by American apprentices?—A. I think so.

Q. Would it not seem more patriotic to limit immigration than to limit apprentices?—A. I think so. The Government ought certainly to feel an interest in the welfare of the citizenship of this country, and undoubtedly does.

Q. In considering the measure of restriction, would it, in your judgment, be wiser to build up our scheme of restriction on trade and industrial conditions rather than on the broad general question of whether the fellow coming in was liable to make a good citizen in a general way?—A. I think that the concern of our Government should be to protect the industrial interests to begin with.

Q. That the basis of an immigration law should be the industrial considerations of our trade rather than the abstract question of whether the fellow will make a good citizen and understand our institutions?—A. I think so; yes.

Q. (By Mr. RATCHFORD.) What have you to say of colored labor and non-English-speaking labor?—A. We have a great many colored laborers in Illinois, and a considerable number of non-English-speaking laborers, especially in the coal mines in the State.

Q. (By Mr. FARQUHAR.) Do you know what nationality predominates among the foreign born there in the mines?—A. The early miners consisted of English, Irish, Scotch, and Welsh, principally, but they have been superseded largely by the coming of these non-English-speaking miners. They consist of Polanders, Frenchmen, Russians, Hungarians, and Italians.

Q. (By Representative GARDNER.) Do the Englishmen, Scotchmen, Irishmen, and the Welshmen desert your mines as the Poleander and others enter them?—A. Yes; a good many of them. They have drifted into other lines of business. They have been forced to it; but it is due in most instances to their ability.

Q. You know there are two elements crowding the foreigner out of the occupation which he first takes up when he comes here; one very often is the competition of a lower order; the other is his own economical and thrifty habits, by which he accumulates the means to go into some other business. Now do you attribute the retirement of the English-speaking people from the mines to one or both of these causes; and if to both, which to the greater extent?—A. I think the additional opportunities that the English-speaking miner has in this country for advancement and for the adoption of other pursuits has had a great deal to do with it. That, I think, taken in connection with the active competition and the decline in the value of his labor temporarily, as the result of the employment of these non-English-speaking laborers, has contributed to the result.

Q. Is it true with you that the English, Welsh, Scotch, or Irish miner very often has a boy who starts with him in the mines, and eventually goes through college and comes out with a collegiate education?—A. We have had many instances of that kind; they are the sons of coal miners.

Q. That boy disappears from the mines by reason of the opportunities given in this country?—A. Yes; we have instances among us, many instances, where the sons of coal miners have become attorneys and doctors, and entered the other professions.

Q. (By Mr. FARQUHAR.) Was it not the importation of contract labor into this country that drove the American and the English-speaking people out of the mines?—A. That was the start of it; yes.

Q. Was not the whole of it contract labor, cheap European labor?—A. Yes; and following that application the prices for mining and that class of work declined temporarily to a very great extent, and the occupation was no longer an induce-

ment to the better skilled craftsman and he left it and found something else. Many of them went on the farms of this country.

Q. (By Mr. RATCHFORD.) We would infer from that, then, that those of a higher standard of intelligence have been forced to abandon that occupation to that extent; and that it is now in the hands of a less intelligent class of people than formerly?—A. That is true.

Q. (By Representative GARDNER.) Among that class of labor you have now, which has replaced the Irishman, Scotchman, Englishman, and the Welshman, is there that ambition for the future of the family that causes the saving and the necessary sacrifices to send a boy to college to get a higher education?—A. No; it is not so.

Q. (By Mr. RATCHFORD.) Are the public-school facilities of your State adapted to the needs of the working people?—A. I think our public-school system in Illinois is about as good and about as extensive as it is anywhere else.

Q. How about the public schools of the city of Chicago?—A. In Chicago I presume there has been more or less crowding. That has been the complaint.

Q. (By Representative GARDNER.) The growth of the city has been very rapid?—A. Yes; it has been so rapid that the school facilities probably have not kept up with it.

Q. (By Mr. RATCHFORD.) What have you to say as to convict labor?—A. There are no two opinions on the question of the effect on wages of the employment of convicts. The tendency of competition with convict labor, of course, is always to reduce the wages of free labor. It is one of the great questions that has been concerning our State legislatures, and will continue for some time. Everyone is satisfied that the convicts should be employed. It is generally accepted that idleness would be about as bad for them as a career of crime. It is agreed that the convict should be employed, but there is a question as to what kind of employment he should be given. In regard to this noncompetitive employment, of course, the employment of the convict involves the question of the removal of the competition from his labor. You can not employ a convict in any line of industry without competing with free labor. The only question that our legislatures will have to solve is, What way can this labor be employed with the least injurious effect upon the free labor on the outside?

Q. (By Representative GARDNER.) The convict laborer now trained in the State prison shoe shop, for instance, learns to run some one machine, does he not?—A. Yes.

Q. And that is all. Discharged from the prison, he may know how to run that machine and that only. What would be his chances of getting employment in his capacity as a free man after he is discharged? First, would his prison record operate against him?—A. I think it would, and his opportunity of securing just the kind of employment for which he had qualified himself during his term in the prison would probably be very rare.

Q. Now suppose, instead of being put to a machine, he was put into the process of hand and mind education, and taught to take the leather and the tools, after the manner of the old-time shoemaker, and make a pair of shoes, and then was turned out. Would or would he not have an opportunity to settle down in the village as a cobbler and make a living?—A. He could secure employment in that way, although the effect of the machine-made product is destroying the occupation of the old cobbler and the old process of making shoes by hand.

Q. But it does not interfere with the mending in any way, does it?—A. Oh, no; the cobbling industry is still living.

Q. Would or would not, in your opinion, the education of the mind and hand to the extent of teaching him to take the raw materials and make a pair of shoes have more of a reformatory effect upon him than to teach him to stand by a machine and make some particular motion there?—A. Yes; I think it would. That plan has been suggested and considered in the reform of convicts, not because there was any consideration of his reformation, but to reduce his power as a competitor in the market.

Q. What would be true in the illustration given of shoemaking would be in wickerwork, willow chairs, and like things, would it not, where the raw material, as, for instance, the willows, are taken and woven into a useful structure?—A. We had under consideration at the last session of the Illinois legislature a measure fashioned substantially after that in force in the State of New York, providing for the convicts in our Joliet and Chester penitentiaries furnishing the State and the inmates of our State institutions all supplies used by the State; that the labor of the convicts should be employed in that way. The legislature adjourned so early at the late session that, though it was ably championed by some of our reformatory people, it failed to pass. It was fashioned, as I said, after the law of New York. In that State the convicts make all the shoes and all the furniture

and all the clothes used by the inmates of the different State institutions; and in addition to that they have, I think, some 15,000 acres upon which convicts are set to work to raise the vegetables used by inmates in the State institutions. While the employment of convicts in that way unquestionably affects free labor and displaces a certain amount of free labor, yet its competitive features are considerably modified in comparison with the present plan of contracting the labor of the convict out and selling his product in competition with the free labor in the market.

Q. You think the worst feature of the competition of prison-made articles is that of their influence in regulating prices?—A. Yes.

Q. And if kept out of the market, so that they exercise no influence in the regulation of prices, the competition is not felt to a large extent?—A. No; it would protect the prices of the product of free labor. It would have that effect. It has that in its favor. The system has been very successful, and the State has managed to employ the convicts and dispose of their products in that way without any labeling.

Q. (By Mr. FARQUHAR.) Is there any feeling in the State of Illinois that the taxes would be lightened by having convict-made goods put on the market?—A. Well, I can not say as to that.

Q. Are there any in the legislature that have contended that the contract system they had in the State of New York was better than the present one?—A. I have never heard of any parties making that claim.

Q. Is it not the usual claim before your legislature that all penal institutions ought to be self-supporting?—A. Yes; they make that plea.

Q. (By Representative GARDNER.) Is it your opinion that if the interstate transportation of convict-made goods could be prevented, and so congest the competition in the States where manufactured, the legislatures of those several States would be forced by the organizations to take immediate and effectual action in suppressing the evil?—A. I think so; yes.

Q. (By Mr. RATCHFORD.) What have you to say as to labor-saving machinery and producing capacity of modern machinery and its effects on prices and profits of labor?—A. I hold, and I think the facts justify the position, that the effect of machinery has been to reduce the prices and increase the rate of labor.

Q. Increase wages?—A. Yes; that three things have occurred, and almost simultaneously: That the machine idea as a factor in production started from the highest point of industrial development, and that with this new agency in production came a lowering of the price of the product and an increase of the rate of wages, and at the same time a reduction in the hours of labor. We find that in the last 20 years that result has followed this innovation in production. Now, referring again to the fact of the increase of laboring men, the census report for 1890 took, if I remember correctly, a list of 60 different industries and compared the number of men employed in those given industries in 1880 and also in 1890, and the record showed that there was a marvelous increase in the number of men employed in those different lines of industry during that decade, and that, together with that increase of employment, there was a material increase in the rate of wages earned.

On the question of the capacity of the several mining industries in relation to consumption and existing markets, I will say that in the preparation of our last coal report for 1898 we took, for the first time, the statistics of possible coal production—that is, we presumed what, with the present equipment of mining plants and running full time, the yearly production would be—and we found from the returns, which were presumably correct and authentic, that the mines of the State of Illinois, some 811 altogether and equipped as they now are and running full time, could produce about 45,000,000 tons, which is 26,000,000 tons more than we have been able heretofore to find a market for. So that the capacity of the mining interests of Illinois (and I presume the same ratio would hold good for the mining plants throughout the country) is about double the market requirements. Overproduction and underconsumption are theories, you know, that have caused considerable discussion and some amusement, whether one is the cause or effect, or vice versa.

As to industrial and remedial legislation, I am taking some little interest in the matter of liability laws. We had one prepared for Illinois and had it introduced at the late session, but on account of the early adjournment, together with the fact that we had some other important legislation in hand, we were prevented from giving it that attention that we should have, and it failed to become a law. It seems to me that the Congress of the United States can enact some good legislation on that question. My private opinion is that we should have a universal law on that question, and that the Congress of the United States, like the Parliament of

Great Britain, should pass it. With the development of the industrial interests of the country during the last 30 years, there is a great necessity and a demand for legislation of this kind. In all fairness to the employing class, between the theory of our judges on the question of contributory negligence and the fellow-servant law, it is almost impossible to establish liability in a damage suit in any of our courts. Our courts have held, for instance, that the crew of one train going east are fellow-servants with the crew on another train going west, and that if death should result through an accident on account of the carelessness of the engineer or the conductor the road could not be held liable, and no damages could be recovered for an accident of that kind. Our courts have held, for instance, in the mining industry that the engineer in the engine house is a fellow-servant with the laborer on the cage, and that, if through the negligence of the engineer the man's life is lost, he, or rather his heirs, have no cause of action against the company. They are exempt from liability, first, under the theory of this fellow-servant idea, and, second, on account of the theory of our courts concerning what constitutes contributory negligence. We have not yet decided the question in the State of Illinois whether negligence is a question of fact for the jury or a question of law for the judge. It has been decided both ways.

In regard to mine-inspection laws, I will say that at the late session of the general assembly the entire body of our mining laws was revised. It was a work that was conducted and prepared by our bureau and involved a great deal of care and labor. Since the first enactment, 25 years ago, some provisions had been declared unconstitutional, and it had been amended from time to time until it was questionable in the judgment of our judges whether we had any mining legislation that the courts could recognize and enforce; it was so inconsistent and incongruous. We went to work and revised the entire system, and have, I presume, the very best mining legislation of any State in this country. Of course, it relates absolutely to the mining industry.

Q. (By Representative GARDNER.) The legislature passed it substantially as you prepared it?—A. The legislature passed the bill as it came from my office without a dissenting vote either in the house or senate. It was passed unanimously, without amendment, without a change in a word or line, and it will go into effect on the 1st day of next July.

Q. (By Mr. FARQUHAR.) What have you to say about the uniformity of mining legislation in the several States?—A. It would be a very great thing if it could be accomplished. The difficulty is that as you develop your industry you need certain kinds of legislation. What is true in the State of Illinois is not true in some State where the industry is not so developed.

Q. Do you think it would be a positive advantage both to the operators and to the mine workers to have more uniform legislation?—A. I am disposed to think it would.

Q. Do you not think that, taking the entire industry, the two great kinds of coal—anthracite and bituminous—it would be beneficial for the mine workers and the operators to come to a general understanding in each State as to more uniform legislation and fair play between them?—A. I think so, and I think there is a growing disposition in that direction, too.

Q. Do you not think such means as that will gradually lead you higher and higher and bring you into more improved conditions?—A. Our new mining law covers about 50 pages. It was agreed upon by committees representing our commissioners, the miners' organization, and the mine operators of the State, so that the legislature had no reason to protest or object to the provisions of the bill. It was substantially agreed to by all those interests.

Q. (By Mr. KENNEDY.) Is Illinois backward in regard to personal-safety laws in factories and workshops, particularly in respect of fire escapes?—A. I think our legislation on that question is fairly well advanced. At the last session of the legislature the fire-escape law was repealed and another substituted in its place. The new act contains an emergency clause, and took effect from the date of its approval by the governor, April 21, 1899. The only change from the former enactment is in the manner of its enforcement. Under the old act the duty of enforcement devolved on the factory inspectors. Under the present law that power is delegated to the corporate authorities of the towns and cities. Strictly speaking, there has been no repeal of the provisions of our law relating to fire escapes. The change provided for in the present act was made necessary on account of some litigation growing out of defective fire escapes which had been approved by the former factory inspectors. In the report for 1898, 8 convictions for failure to erect fire escapes are reported, also for failure to provide blowers for friction wheels. That was also provided for several years ago.

Q. In your opinion, what has been the influence in the last 30 years that has

brought about the enactment of the personal-safety laws, the laws regulating the employment of children, the laws regulating mediation and arbitration, convict labor, inspection, etc.?—A. I think it has come principally from the influence exercised by the organized labor of the country.

Q. Has not organized labor sent lobbyists to the State legislatures for this legislation?—A. And to that interest is due the credit for that legislation. I think that is true.

Q. What interest is it in your State that is agitating the adoption of the New York State industrial code in the State of Illinois?—A. Those interested in the enactment of a more rigid factory law.

Q. Has it been recommended by any State officer recently?—A. No; I do not know of any recommendation of that kind. Of course, New York and Massachusetts and those Eastern States have had those difficulties to contend with for a much longer period of time, and in many respects they get better regulations, but the tendency, anyhow in Illinois and in other Western States, is to adopt the provisions and regulations of the Eastern States, so that they will eventually come to be nearly uniform in one way or another. The bill introduced at the late session of our legislature concerning convict labor was copied from the New York act that has been in force for about 2 years in that State—1896, 1897.

Q. Has there been any effort to have the factory-inspection laws of the State of New York duplicated in Illinois?—A. No, not that I have any knowledge of. Our factory legislation has been somewhat neglected, I do not know for what reason. The system has been crippled by reason of the failure of the State to furnish sufficient money. The factory inspector has been required to lay off a great number of his deputies for 3 or 4 months during each year, for the reason that the State had neglected to move, or the people interested in that line of work had not succeeded in securing the necessary appropriations. This year, however, at the late session of the legislature, the legislature appropriated \$7,000, I believe, which is an increase of \$3,000 or \$4,000, and will enable them to make full time at least.

Q. (By Representative GARDNER.) The chief officers of the various State labor bureaus meet in annual convention each year, do they not?—A. Yes.

Q. Is that likely or not to lead to a general harmonizing of ideas among them as to labor legislation?—A. That feature has not been considered particularly. I was present as a delegate from Illinois at the last two conventions of the chiefs of labor bureaus, the first one at Nashville and the last one at Detroit, and the questions considered at those conventions related more to a general discussion of economic questions and a review of the current work in which the bureaus were then engaged than to any labor legislation as such; but I anticipate that those questions will come up, for it is a good place at which to consider them.

STATE OF ILLINOIS, *County of Sangamon*:

I swear that the statements made by me of my own knowledge in the foregoing report of my testimony before the Industrial Commission are true, and that all other statements I believe to be true.

DAVID ROSS.

Sworn and subscribed before me this 30th day of December, 1899.

J. D. ROPER,

Notary Public, Sangamon County, Illinois.

DENVER, COLO., *July 12, 1899.*

TESTIMONY OF HON. JAMES B. GRANT,

Ex-Governor of the State of Colorado, General Manager, Smelters' Trust.

At a meeting of the subcommission on mining, at the Albany Hotel, Denver, Colo., convened at 2 p. m. July 12, 1899, Representative John C. Bell presiding, Hon. James B. Grant, being duly sworn, testified as follows concerning the mining industry in Colorado:

Q. (By Mr. RATCHFORD.) Will you kindly state to the commission your full name, address, and place of business?—A. James B. Grant; for many years I have been in business; my headquarters have been in Denver, but my company operates in different places; my residence is Denver, Colo.; my chief business has been that of smelting lead, silver, and gold ores, and refining. Incidentally I have been engaged in silver and lead mining in Colorado.

Q. Any connection with coal mining?—A. No; no more than holding some stock in coal mines. I know nothing especially about the coal-mining business.

Q. How long have you been engaged in mining and smelting?—A. Twenty-one years.

Q. If you will kindly take the topical plan of inquiry, it will not be necessary to question you so frequently. You can take the questions as indicated by the numbers and treat them in your own way, taking your own time and making your statements as fully as you care to. Taking first the topic suggested on page 7, Part II—Comparative earnings of capital invested in mining during the past 50 years.—A. In the State of Colorado there has not been any great amount of capital, I should say, invested in the mining business, except as it has been taken out of the mines. In other words, almost every mining district in Colorado has furnished the capital to develop the mines of that district, so it is hard to make any comparison with other lines of business. If a man engages in any other form of business—taking the banking business, for instance—he puts in a large amount of capital, but in the precious metal mining in this State there has been very little original capital put in. Of course a great deal has been put in in speculative enterprises, but the real paying properties have been discovered by prospectors, and they have sold many of them to speculators.

Q. And largely, say, within the last 50 years?—A. Within the last 20 years.

Q. If you can not make a comparison with the present time and 50 years ago, take as far back as you can—20 or 15 years.—A. I don't believe I could give any reliable information on that. There is such a vast amount of money put into mining that is speculative, and from which you can get no returns, that it is almost impossible to make a comparison with what we call a strictly manufacturing or banking business.

Q. That has always been true, has it not?—A. Yes; that is true as to silver and gold mining.

Q. You can not state in general terms as to the earnings of capital compared with this and any previous time?—A. I do not think so. There are very few mines in this State where a large amount of money has been placed with a view of permanent investment; it is largely speculative, and it does not make any difference what part of the State is concerned. I look upon it largely as a speculative business that promises enormous returns on the money invested. There are few large mining properties in this State—low-grade mines—where capital has been invested and has built mills and got good, fair returns; that is not the rule. Take the Leadville district, and take that of Cripple Creek, and such mines as the Little Pittsburg and the Independence—the Independence was discovered by Mr. Stratton—and the Portland—that was discovered by Burns and Doyle and their associates. They had absolutely no capital to back them, and yet the Independence is now paying \$150,000 per month, and I presume Stratton would tell you that he didn't invest \$500 to begin with; the mine paid from the grass roots. Now the investor comes in and it was sold, or supposed to be, in London, on a very large basis, stated by the papers to be five or ten million dollars. It will take years before that mine is exhausted, in all probability, so you can see what an amount of interest that mine will pay on the amount invested; and so far as the prospector is concerned it has paid beyond all calculation. This is the case with the Portland; it is the case with the Elkton, and every other big mine in Cripple Creek to-day. The original cost to the owner was about the price of the land paid to the Government; and if not, it is paid in prospecting, sinking shafts, etc. I know that is the case at Leadville; it was the case at Aspen, except so far as money was spent in litigation. There capital came in and fought lawsuits over the property, and large investments were made on that basis. Counting the returns to the capitalist, probably that has not been very flattering, because he comes in really at the very top of the ladder and gets out where he can.

Q. Is the capital invested for the development of the mineral resources of your State to-day greater, in your opinion, than it has been at any previous time?—A. I think so; yes.

Q. Is it still increasing?—A. Yes; mostly in the way of improvements—in the way of concentrating mills and drainage tunnels, deep shafts, and conveniences for handling the ore, such as conveyances for taking the ore from above timber line down to the streams and valleys below. The great amount of money that has been put into the business in the past few years has been spent in the way of tunnels, improvements in concentrating mills, and cyanide mills for treating low-grade ores, for tramways for conveying the ore from the mountain tops to the valleys, etc.

Q. Is that increased capital invested in mining due to the prosperous condition of mining, or due to the lack of that prosperous condition in other lines of industry?—A. I think it is due to the fact that people see more money in it than they

do in other lines of industry or investment, and it is also due to the fact that many people located claims in this State 20 or 30 years ago upon which they never did much because of the cost of the treatment of the ores—low-grade mines—and now that the prices for treatment have been lowered and the cost of development is cheaper, through the utilization of electricity and other modern methods, the prospector has been enabled to induce capitalists to take hold of these properties and develop them.

Q. You state, then, do you, that there is more money in mining than there is in other lines of industry? Do you make that statement clearly and definitely?—A. I could not say that definitely. The profits in certain instances are so great that, as a whole, it invites capitalists to such an extent that it draws them away from the other industries in the mining district; and that is going on to-day to an extent that has never before existed in this State.

Q. What have been the effects of restrictive and other industrial legislation on the capital employed in mining in your State?—A. Does that refer to State or Federal legislation?

Q. To State, or to any part of the State you care to speak of.—A. There is no legislation in this State that could be regarded as restrictive legislation, unless you consider the act of the last legislature on the 8-hour law. There is no such legislation that I know of, unless that could be considered so. There has been no legislation that tends to discourage the people from investing in mines at all, and I don't think that that law tends to discourage them; but if it does, then, with that exception, there is nothing that I recall that does.

Q. Have you had any legislation as to screens, company stores, or other conditions extending to mining?—A. Yes; the last legislature passed a law in regard to company stores; but that has been very limited in this State. The practice of the company store has been very limited and has never been practiced, so far as I know, in the precious-metal industry. The most that has been done in the precious-metal industry is, where the mine is located on the hillsides, away from towns and villages, the companies have had a few boarding houses, but in no case do I know of a silver or gold mine having stores in the State of Colorado. The only company having stores, so far as I know, is the Colorado Fuel and Iron Company, and I don't suppose it would interfere with the mining industry if stores were abolished entirely; so that the abolition of the company stores could not be regarded as affecting the coal-mining industry in this State.

Q. You are connected with various companies, both in the mining and the smelting business?—A. Yes.

Q. You are representing those companies here to-day, are you?—A. Yes.

Q. Will you state the number of mines owned and operated by the companies with which you are connected, and where they are located?—A. I am interested in the Smuggler-Union mine, at Telluride, Colo. I am interested in various mines as a stockholder, and some of them as a pretty large stockholder, in Leadville, Colo.

Q. Do you wish to call the names of the various companies?—A. The Silver-Gold Company and the Nisi Prius Company at Leadville, and I am also interested in mines in Idaho and in Utah; probably 6 or 7.

Q. Could you state approximately the number of miners employed in the different mines in which you are interested?—A. Of the different companies I am interested in to-day, the most men are employed in the Smuggler-Union—about 300 men employed there. I am in the Smuggler as a stockholder, and have been a stockholder for many years. I suppose there are about 500 men employed by the different mining companies in which I am interested as a stockholder.

Q. And can you state the number who are connected with the mines who are not miners?—A. Do you mean the smelting business?

Q. No; I mean mining laborers—day hands, as they are called—outside of those who are miners. I mean the men working about the mines who are not miners?—A. What I had reference to included the whole number of men.

Q. Could you state to the commission the amount of capital invested in mining by the different companies that you have named?—A. No; I could not.

Q. As to taxation, character, extent, and effects of in the different States, in your own State—what do you say in that connection?—A. I think the tax laws are very favorable to mining. I should say they are very favorable; a very light valuation is placed upon the improvements upon the surface, and all of the mines of the State are taxed under a general law on a certain percentage of the net output.

Q. As to this percentage of the net output—if you make no profit you pay no taxes, except on improvements?—A. Like buildings, machinery, etc. As a general thing the buildings and machinery are put in at a small valuation.

Q. You have no suggestions, then, to make for the modification of the tax methods?—A. No; I never heard a complaint made about taxes in the mining industry. I don't think the taxes are burdensome in any way.

Q. In the transportation of the product of your mines, have you experienced any discrimination?—A. I would hardly want to answer that question.

Q. Do you decline to answer?—A. Yes.

Q. The closing of mines in localities, causes natural and artificial; what have you to say upon that topic?—A. With the exception of a short period in 1893, when the average silver miner felt that he could not mine at a profit, there were no mines closed down except for the reason that they didn't have value enough to make it profitable, and under the conditions prevailing in this State that value has to be very light. I think it is a mistaken idea about any great number of mines with vast bodies of ore in sight being closed down anywhere in the Rocky Mountains. I know of none, except where the grade is exceedingly low; and it makes no difference what value metals have, there are always certain ones carrying ore that is below the profitable point; even with gold at \$50 per ounce and silver at \$2 an ounce there are some mines that could not be operated at a profit; but with the improvements that have been made for the treatment of ores, both gold and silver, the improvements that have been made in concentration and in chemical methods, in mining machinery, in drills, and the use of electricity, and in methods of transporting the ore from the hillsides down to the valleys by means of conveying machines, there are very few mines of any kind of value in them that can not be made to pay. As a general thing the mines that have closed down have not value enough to make them profitable.

Q. They have never been closed through artificial causes?—A. With the exception of 1893, when we felt that we could not mine silver below 90 cents per ounce, there has been no general closing of the mines from artificial causes. Of course there are properties that could be worked at a profit if silver had a high value that are not worked to-day, but I don't believe there would be any more mines worked to-day in Colorado than there are now if silver was at 90 instead of at 60 cents per ounce. There would be very few if any more. The mines of Colorado are peculiar in this respect. There are very few camps where we have a mixture of gold, silver, copper, and lead, although many of them carry all four of these values; the most of them carry two; many of them carry three, and all of course carry one metal or the other. We always catch one high grade, which keeps people in a healthful frame of mind regarding the development of the properties, and were it not for the shutting down of the smelters and the consequent shutting down of the mines, the tonnage would be vastly greater to-day than it has been before in the history of the State.

Q. What have you to say of concentration and consolidation of capital?—A. I take a decidedly different view regarding the consolidation of capital from the great majority of the people, apparently, in the United States to-day. I contend that while at times it might make the consumer pay a little higher price, in the long run capital could get a surer return and that labor will get a more uniform condition of payment of wages; that there is less tendency to cut the price of labor in any business that is consolidated than where a various number of separate enterprises are in active competition with each other; and I regard consolidation as the inevitable result of competition and almost the only remedy for the ruinous competition that almost always prevailed in any manufacturing business many years ago. For instance, when I first started smelting it would take six months to build a furnace; we went at it very slowly and conservatively, and with a very small tonnage of ore in our furnaces at first; and at that time competition was not such a serious matter, because competitors could not build so rapidly as they can at the present time. To-day, where we can smelt 100 or 150 tons of ore in a furnace daily and where you can get material to construct furnaces in such a short time, any large company can in six months make preparation to handle the bulk of the silver and lead mined in the United States that is suitable for smelting. Now, if companies come in they are all in competition with each other, thereby sharpening the competition. Contracts for handling and buying ores are usually made up for six or twelve months. Suppose you get a contract that is satisfactory to you for six or twelve months; the next year in comes the competition, and in a short time you will not be running at a profit, and therefore are not going to get out of the woods. There is only so much ore to be handled, and one big company can handle a large part of it. Then there is the question of the coal to be supplied, and the laboring side of it, so that in the end the competition is disastrous to labor and disastrous to each competitor.

Q. You believe, then, that the effects of concentration, combination of capital will be beneficial to labor?—A. I believe so.

Q. Although it may result for a time in higher prices to the consumer?—A. Well, it makes it possible. Of course, in the business in which I am engaged the large part of it is gold and silver; that does not cut much figure to the consumer, but in lead it does. One or two companies handling the lead product makes it possible, in the smelting of lead and on the lead products, paint, etc.; and the beneficial result will come to the men who own the mines, and the miners will also get it in the pay for their labor.

Q. From your statement I take it that the benefit falls only to the mining and smelting interests?—A. Well, I was speaking in reference to the smelting interest.

Q. If that would be true of the smelting interest as regards combination, is it not also true of the mining interest?—A. The mining interests are very much more widely scattered than the smelting. In the State of Colorado the occurrence of gold and silver is different from that in almost any other Western State. In Idaho you have a few very large mines, and one mine alone produces almost half the entire output of Montana—the Anaconda—yet in these States the improved condition is not represented, as in Colorado. In Colorado the veins are smaller on the average, and there are a great many very rich ones, and the ownership is very diversified here. There are more people, in my opinion, getting profits out of Colorado mines than out of almost all other States and Territories put together, East or West. There are tremendous mining properties and small ownership in other States, but in Colorado many rich veins and a widely distributed ownership. Everybody has something in the mines here. This is largely due to the fact that there are an almost unlimited number of veins, and the mineral occurrence is therefore different here from in most other States. There is not a mine in Colorado that approaches, for instance, the output of the Anaconda, or reaches one-tenth of it, and in that regard it makes Colorado the most promising field for the poor man to mine in. It makes a better field than any other State in the Union. The great majority of Cripple Creek property owners are men who practically owned nothing 5, 6, or 7 years ago. In the later days the capitalists have gone in there and bought and leased mines and dabbled in stocks, but the original owners of these properties were nearly all poor men. I should say at least 85 per cent of them were poor men when they went there.

Q. The main objects sought by these combinations, according to your method of reasoning, is the limiting of competition?—A. Yes, that is what I should say; limiting competition and cheapening certain methods of handling the business, and a more certain control of the disposition of the product.

Q. If combination in this particular line of industry will bring about such results, then such combination in other lines of industry in which competition is fierce will be equally desirable, will it not?—A. I think so. I regard it as an economic tendency of the age that is going to obtain, regardless of legislation.

Q. What is the effect on smaller enterprises?—A. It will not interfere with smaller enterprises, so far as mining in precious metals is concerned. It is only in isolated cases, where there are small coal mines, that it is apt to interfere; but that is entirely different with the small owner of the precious metals mining property, because the price is practically uniform and the transportation rate is practically uniform. The small mine owner in this State gets as good prices for his ore at the smelter as the large owner, and so far as I know there is no discrimination practiced against him at this time and never has been. Sometimes the smelter company wants to get a special product of lead for the fluxing of ores; that is exceedingly important in carrying on the business, and there may be a little shading of the price beyond what you would pay for what we call a carload shipment, but it is almost universal that there is a uniform price paid for a certain grade of ore, regardless of whether this man or that man owns it.

Q. You believe this is the material point in which the mining of ore differs from the mining of coal?—A. Yes. That is to say, there is always a fixed valuation and market for the ore as it is produced, and that price is uniform, regardless of the quantity.

Q. The legal regulation of trusts and other forms of monopoly; operation of existing antitrust laws; suggestions for modifications or extensions; have you any suggestions to offer for the legal regulation of such consolidations as we have been discussing?—A. I don't see how you can legislate against them except by discriminating against them. For instance, take the particular business with which I am connected, and it may be a monopoly or trust, as it is sometimes called, where one company is made up of a large number of companies; it is simply an extended ownership under the head or possession of one company; we do not ask anything, don't ask any favors that every other man or corporation does not get, and any regulation or any legislation tending to regulate it would be

just as harmful to other industries as to ours. If you legislate this consolidated industry out of existence, it seems to me that you must legislate individual industries out of existence, unless you make an open discrimination, and simply say that you don't want this large amount of capital invested in this business, and legislate it out of existence.

Q. Do you believe that any law that would in any way restrict or generally regulate the management of this concern would be an unjust law?—A. Well, any law that did not apply to competitors in the same business would be.

Q. An individual business or concern?—A. To any competitor. There is no such thing now as an individual, unless he is enormously wealthy, conducting a smelting business or industry successfully. He can not do it for the reason that there is hardly a mine in the United States that furnishes just the right kind of ore to make a proper and economical smelting mixture; and there is no smelter located in Colorado which does not draw these ores from all parts of the Rocky Mountains; they draw ores from Idaho, Utah, and from Montana, and any individual or company which only operates one smelting plant will be at a disadvantage compared with any combination that covers the entire field—using the word individual, by that I mean individual or corporation, either, because there is no one individual in this country that I know of who has been operating a smelter in the past 10 years. In using the term individual I don't mean to convey to your minds that it must necessarily be a single person, but rather one or more persons who engage in business and who operate under a charter from the State.

Q. That is a partnership?—A. Yes; one or more persons.

Q. Now in one case the State is called upon to grant a charter and in the other case it is not. Do you or not believe that the State has rights in one case that it has not in the other?—A. I think it would be unjust for the State or legislature to govern a concern simply by virtue of its charter when it had no special privileges, and not have the same legislation apply to the partnership competitor in the same business, and make the distinction that one had a charter and the other had not. That would of course tend to prevent the consolidation of capital, and prevent the organization of companies. It would throw the business back into the hands of partnerships and individuals. In that way of course we would go in and do business, but we could not do it on the same scale as we did, or as we do under the conditions now prevailing. The development of these mining properties would never have been so rapid under such conditions—under the partnership conditions—as they have been.

Q. Do you find that under such a combination you will be able to smelt cheaper than formerly?—A. We have not been running long enough to tell. Naturally we expect to be able to cut off a great many expenses.

Q. That brings us back again to the statement you made earlier in your testimony. You expect to be able to reduce the expenses of producing your material by reason of the combination, and you stated that you expect the existence of that combination will result in higher prices to the consumer.—A. I don't say that the company expects any profit from higher prices to the consumer, but I say it is in the power of consolidated capital to regulate the prices of their products better than when a large number of people are throwing the same product in the same market. Outside of what is consumed in the manufacturing markets of this country and others, the final disposition of silver is in London. When there were 10 of us undertaking to supply this market we very naturally got the worst of it, and I think we will be able to hold silver at a little better price—at a more stable price than we would get for it otherwise—than we got when we were operating separately. Now, the same applies to lead. There were 8 or 10 refineries selling lead. I think the officers of what is known as the lead trust will tell you that they are able, or will be able in the future, to maintain a steadier market for lead than has existed heretofore, and possibly secure a little higher average price. I don't pretend to say that the consolidation can control, in this regard, the supply and demand—that is out of the question—but every ounce of silver that has been produced since 1893 has found a ready market, so that the demand for it is active and good and always has been so; and yet at periods we have sold it away below what we know should have been the market price—sometimes 4 or 5 cents below what the market price should have been—but we were dealing as separate companies then, and if we undertook to hold it over our competitors would go in the market with 500,000 ounces or such a matter and that would make it still lower next month, and the parties at that end of the line reaped the benefits at our expense and at the expense of the producer, because the producer was only paid the market price. Along that particular line I may state that I think we will reap some benefit from consolidation, some very material benefit, but we have not operated long enough under the consolidation system to say

definitely what that benefit will be, and, of course, we may be disappointed in the result.

Q. Do you expect to regulate or limit the production in any way in order to reach this result?—A. Well, we could not do it on silver and gold. Lead production could be regulated very easily, but it would take \$10,000,000 to do it, and that would be to purchase the Cœur d'Alene mines and regulate the output. It is impossible for any consolidation to regulate the output of the mines in Colorado or Utah because of the great number of mines. That has been talked about some by combinations of mining men with smelters since 1893, but there is no way to undertake to carry out a scheme looking to that end. In Idaho they mine over 30 per cent of the lead consumed in the United States, and naturally if one corporation controlled those lead mines it could limit the production and make money by so doing.

Q. I take it, then, that there are two main objects sought by this smelter combination—first, to reduce the cost of producing the ore; secondly, to have the disposing of it at a higher price?—A. Yes.

Q. Take up topic 53 in this same relation. The causes inducing combinations; objects sought by them; results secured; rules, regulations, and constitutions; manner and extent of enforcing authority. Please answer it in your own way.—A. The causes inducing combination in all cases, in my opinion, are to avoid excessive and ruinous competition and to enable the capitalist to get a reasonable interest on his investment by enlarging the capitalization. I would say that when any man is engaging to spend a large part of his life in building up an industrial enterprise the first thing to be considered is to get an income from it, and the one cause, in my opinion, above all others that threatens that income is competition.

Q. Have you anything to say as to the results secured?—A. Well, if the combination succeeds they will get the income. It is less necessary, where you don't have active competition, to ask railroads to reduce rates, to ask fuel companies to reduce rates, to reduce the price of coal, and it is less necessary to ask labor to concede more. It is a more satisfactory result, because a man or company engaged in an enterprise of that kind, where there is active competition, has to cut on all sides. He will undertake, before giving up his business, to cut everything that enters into the cost of the operation to the lowest possible point, and that is universal with mankind. I don't care where he is or what he is doing. He cuts the cost on every single point before he will see his business go to pieces. I claim that we have suffered more from competition than from any other thing that enters into the business. I know from personal experience that when a business gets to a low point, and practically every business reaches that point in its history where you can make little or nothing, they cut on every point. In our business the competition is on the ore, the material out of which we make our money.

Q. Is it your opinion that if such combinations continue, competition as regards labor will be limited, in time?—A. No; I don't think you can ever expect to limit the competition in labor so long as the foreigner in Europe curtails the price. I don't think the competition in labor can be limited unless the working population of Europe is barred from the United States. Out West here, that is where the danger to labor largely comes from. You see, the management of industrial enterprises, whenever threatened with strikes, as they have been frequently out in Idaho and in Wyoming, can import men from other States. That has occurred in this State a number of times. That would not be the case except for the competition in labor, possibly, in manufacturing enterprises; although the laborers that have come into the West, what you would call the importation of labor, has been mostly in the enterprises where there is no special competition. About the only business where competition does not enter is in the mining of the precious metals.

Q. Do you think that, with the combinations or trusts, our wage system will continue for a long time as it is—that is, that the laborer who desires to work the cheapest, all other things considered equal, will be the laborer that will be employed?—A. Oh, I think that is so.

Q. You believe that is the case?—A. Let me think about that a little. It is a very difficult matter to say which is the cheapest labor. It is not always in the amount that is paid. The lowest-paid man is not always the cheapest labor employed; but I think, as a general proposition, you can say that the labor that is the cheapest will always be employed where there are no restrictions against it.

Q. I will put the question in another way in order to make the records clear on that point: That with the combinations, where 2 men are seeking employment, men who are equally skilled, equally willing and equally able to perform labor, and one is willing to work for a less price than another, do you think the one willing to work for less wages will be employed?—A. Yes.

Q. Have you anything to say as to the regulations of these combinations? Could you furnish the commission with the constitution of your organization—rules or regulations?—A. They are the ordinary by-laws of all incorporated companies. I could not tell you exactly what they are, you know. There is nothing in them materially different from any other ordinary corporation.

Q. Would you care to supply the commission with a copy of the rules and regulations of your organization?—A. Yes; I can do that, but I may not be able to do it immediately. This company is incorporated under the laws of the State of New Jersey; the officers are composed of a president, vice-president, and board of directors, and this particular organization is run by an operating committee.

Q. When was this particular organization formed, recently?—A. It was formed the 1st of May, 1899.

Q. What have you to say with regard to modern mining machinery? Do you employ machinery in your mines?—A. Yes.

Q. What are the effects of mining machinery on prices and profits and on labor?—A. Well, the only machine that tends to displace labor in a mine to any great extent is the drilling machine. They are all being improved a good deal lately, especially the drill that is operated by electricity, which is just being introduced in mining in this State now. It is supposed that men feel that anything which tends to lessen the cost of production will increase the profits, but labor has not been displaced to any great extent in mining the precious metals by machinery in this State.

Q. What is the capacity of the drilling machine?—A. That I could not tell you now.

Q. As to operating with hand labor?—A. I could not state that.

Q. Have you anything known as a gauging machine?—A. That refers to coal mining?

Q. Yes.—A. I have had no practical experience in coal mining. Of course in certain formations the drill tends to lessen the cost and tends to displace labor to a great extent.

Q. Have you anything further to say on the subject of machinery?—A. No.

Q. What have you to say of overproduction and underconsumption, causes and remedies—that is a broad field?—A. Yes. The one I have dealt with particularly is that of precious metals. We have always been afflicted with underconsumption of whatever we have put our money into. Of course there is no such thing in the immediate future as an overproduction of gold, and as long as there is an active and ready market for silver bullion you can sell every ounce produced the moment it is in shape for marketing, and you can not tell whether there is an overproduction or not. Naturally, if the world only purchased half of the silver it produces now, we would get better prices, but we can hardly class what you might call the overproduction of silver with coal or cotton or anything of that character; you can not class it with other products, whether it is overproduced or not. There has never been any serious overproduction of lead in the United States. Whenever there is a little larger amount produced than we consume, the price falls at once, unless it is held by speculators. Of course, if the production continues in advance of the seller, the falling price comes in for a time until the demand catches up with the supply.

Q. What have you to say with reference to the extension of foreign markets?—A. Well, I have no particular dealings with any products that go abroad to a large extent, except silver, so that anything I might say would not have any particular weight.

Q. Can you state, approximately, the comparative cost of production of ores for the past 20 years?—A. The cost of production is decreasing constantly in precious-metal mining. You can not compare it with coal mining or anything of that kind. You can get one man to take out 50-ounce ore at \$2 a ton, and another man might get more for taking out a ton not worth anywhere near as much. It depends altogether upon the manner in which it is found—the manner in which it occurs. There has been a very general and marked decrease in the cost of production of ores in this State.

Q. That decrease is due to what?—A. Greater intelligence on the part of modern management and the use of machinery.

Q. Has that or not brought about any reduction in wages; and if so, to what extent?—A. Very little reduction. Wages in the precious-metal mining in this State have varied very little in the past 20 years.

Q. (By Mr. KENNEDY.) Do you believe labor in the mining industry in Colorado is adequately compensated?—A. Well, in the precious-metal mining I think so, compared with my knowledge of what a laboring man gets for similar work elsewhere. Now, if you had asked the question as to whether or not labor was

high enough, I could not say. I look upon it largely as a matter regulated by the supply and demand.

Q. You have said, I believe, that the combinations such as we have been speaking of have a tendency to steady the wage conditions of labor. Is there any tendency to increase the wages of labor as a result of these combinations?—A. Well, I don't say that a special combination tends to increase the price of labor.

Q. One of the objects of the combination is to increase profits, is it not?—A. Not necessarily; it is more to maintain the profits you already have.

Q. By limiting certain expenses—throwing certain superfluous employees out—are not the profits increased?—A. Well, to a certain extent; but that depends upon whether you throw anybody out or not. In our case it is not possible to dispense with employees to any great extent. Now, in this particular combination, as I have stated before, we have only been running two months, and we have not demonstrated that we can dispense with any great number of men.

Q. Do you believe that if there are increased profits as the result of this combination, the employees as well as the employers should share in such profits by an increase of wages?—A. Well, I would say that equitably they should, at least I would think they should; and I want to say as a general proposition that it is so. I think the people of any kind, whether as individuals or corporations, very seldom advance the price of labor except as a question of supply and demand. You see the business I have been engaged in has been in this State, where there has been exceedingly slight variation in the price of labor. I have been in the smelter business in Denver for the past 18 years, and there has never been but one change in the price of labor during that time. We fixed the price in 1882 and did not change at all until 1893, and then we had some closing of the silver mines, as I stated before, and we did not know what would be done—didn't know whether we would exist at all or not. We then reduced the price of labor 10 per cent. We restored that condition on the 1st of June, after this consolidation took place, and then we had the strike.

Q. Speaking of supply and demand, you stated, I believe, that this combination got better fixed prices for products than would be the case under the old system with individual competitors. If supply and demand acts as a regulator, why speak about that feature? Didn't supply and demand regulate it before?—A. Supply and demand regulated it before; but as an individual company we needed a large credit, and when you are producing a product like lead, for instance, as we did in the company, it meant \$5,000 or \$6,000 a day, and we could not carry it 30, 60, and 90 days. The corporation with a very large capital can have certain seasons for the marketing of its products. And there are daily operations, especially in lead—the market goes up and down; and the same is true of silver—a slight change in the market price makes a great difference. There are certain periods when silver is active in Asia, and we could not carry it as a company where the speculators were carrying silver to a great extent. In order to reap the benefit of the rise in the price in Asia, as I stated, it might be necessary to carry our products for from 30 to 90 days, and sometimes longer than that, in order to get the benefit of the better market. Now, what is true of silver is also true of lead. We pig lead for the purpose of manufacturing paint, etc., and there are certain periods of the year when there is a great demand for lead products, when the market is better than at other seasons; the price is usually much better at these times than at any other. Now a very strong combination can carry the products over, as in any other business, and make a uniformly fair price on the average the year round. I am sure the combination can accomplish that point.

Q. Then this company would be strangling the law of supply and demand?—A. Well, it would be conclusive. I do not think it would interfere with the supply at all. It would not flood the market. You see the manufacturer who understands his business, when lead falls to $2\frac{1}{2}$, would be in the market and lay in a supply. The price is higher at certain periods than others; sometimes it falls from $3\frac{1}{2}$ to $2\frac{1}{2}$ —\$20 per ton, and the shrewd manufacturer who is posted knows this, and he is in the market at the right time and with the money to buy; but the small manufacturer can not do this; he can not carry the stock, hence he can not stock up at the low price, and he is often compelled to pay the highest price for it. Now, if the lead were in the hands of strong companies, the price would be uniform, say worth $3\frac{1}{2}$ cents, and the small dealer could figure upon just about what he would have to pay at any time; he would know the amount he could purchase and that he could get it at that price.

Q. It seems to me that it is plain, according to your argument, that you regulate the law of supply and demand, when you control the supply and get a greater price than would otherwise be the case?—A. Well, I believe it is perfectly defensible, this power to regulate the supply and demand. I think with the miners of

the Cœur d'Alenes country, where the greater part of the lead supply of this country is produced, it is a business proposition. These men are all human and want a good price for their products.

Q. It may be justifiable for the men to do it, but is it not a violation of the natural law of supply and demand?—A. Oh, yes.

Q. What have you to say on the overcapitalization feature of the combinations that are being made nowadays?—A. I don't know that it is going to have any damaging effect. I don't think it is. If they are too much overcapitalized they will simply pay no dividends, or pay such little dividends that the stock will have little or no value, and when there is no market for it there will be no overcapitalization.

Q. Are they not trying to induce the public to purchase stock with the idea that it will pay dividends?—A. I don't know of any case wherein they have tried to do that. I know of no special inducement in that direction.

Q. Don't they attempt the sale of any stock in the different markets?—A. Of course they offer stock for sale.

Q. They would hardly offer stock for sale without holding out some inducement for the purchase of it, would they?—A. Well, I don't know of any special inducement they have been holding out in this business. They might be paying dividends on the preferred stock and they might be selling the common stock, but beyond that there has not been any inducement to deceive anybody.

Q. Don't you think it would be for the interest of the people if the State legislature should interfere and prevent the overcapitalization of such concerns?—A. Well, that is a feature to which I have not given much thought. I think perhaps that legislation along that line would not be unwholesome or prejudicial to the general industry of the country; but I really think you can not do anything by legislation to stop speculation. If people choose to invest in stocks, I don't see how there is any way to prevent it. I don't see how the legislature is going to say how and when or in what manner a man shall invest his money. You know people will invest in stocks; get the assurance of their brokers and then go ahead and take their chances. Of course, as to anything in the nature of fraud I think, as you say, some legislation should be enacted to prevent it.

Q. Don't you believe that in a general way there is fraud in these largely overcapitalized concerns in which the watered stock is greater than the real amount of capital invested?—A. No; I don't think it is necessarily fraud; I think it depends altogether upon the conditions under which it is put upon the market. Everything in the United States, you might say, is in a growing condition. You invest, we will say, in a water plant or gas plant in a growing city of 100,000 people. You can figure, probably, that the population will double in 10 years' time and that the increased profits of that company will be in proportion. The common stock is generally based on the future possibilities in most of these companies; it is based on the future growth of the business, and a purchaser knows it as well as the seller, so that you can hardly say it is a fraud perpetrated upon the public. Most of these companies build on the basis of preferred stock which they feel sure—or pretty sure—that they can earn good dividends upon. As I stated before, the business will increase from year to year and the buyer has every prospect that his stock will earn dividends for the next 10 years. I don't see why it is not a perfectly legitimate business if the company should issue common stock based on its future possibilities; and it is done to such an extent in the United States—there was never a railroad built in the United States where the common stock in all probability did not practically represent what you would call watered stock, and in very many instances the growth of business of the company has been so great as to earn profits to more than meet the demands of the preferred stock.

Q. Suppose a business which offers a certain profit to the people who are interested at \$35,000,000, the real amount of capital invested, has a fictitious capital of \$35,000,000, would not such a company or corporation have a very plausible excuse for not giving the people a product at the lowest possible price consistent with a good profit by making public the statement that they were not earning dividends on their capital, which would be stated as being \$70,000,000, when half of it was fictitious and was never put in the business at all?—A. Well, the tendency would be, of course, to make the most money they reasonably could out of it.

Q. Would not that also give them an excuse for not giving their employees adequate compensation—telling them that they were not earning dividends on their capital stock?—A. Well, it might and it might not.

Q. (By Representative BELL.) The closing of mines in localities, causes natural and artificial—I want to ask you if the closing down of the smelters did not cause the closing down of a great many mines in the State?—A. Yes.

Q. I want to ask further whether any others outside of those in the so-called trust have closed down?—A. No. There are only two others in the State.

Q. The individual smelters are operating?—A. Yes.

Q. While combination has a tendency to a reasonable degree to lessen the cost of production, might not an institution get so cumbersome that it will really increase the cost of production?—A. Well, yes, possibly it might by poor business management.

Q. Is it not more probable when you get a great institution in the hands of those in interest that it will make much more expense than where it is kept separated in a reasonable degree?—A. Yes.

Q. Now, I want to ask if in your smelter business the employees become, as it were, a part of the business, a part of the institution, and build their little homes in the community surrounding the smelters?—A. Yes.

Q. Under a combination like that, is it not possible, and in fact probable, that the combination might shut down one of the smelters; for instance, say you had a smelter in Pueblo, just as an illustration, might not that smelter be shut down, and thus throw the employees there out of employment?—A. That is possible.

Q. And add to the smelter here and not hurt the combination at all, but at the same time do a great injury to the employees at the other point?—A. That could only be done where we had a much greater capacity to handle ores than the demand called for.

Q. Now, you spoke of the benefits of the combination, which we must all admit in a reasonable degree—that it makes prices stable and enables you to deal more liberally with your employees?—A. That is true.

Q. Now, I want to ask you if wages have ever been kept up in the United States except through the organization of the employees themselves; has there ever been any other power that has ever kept up and maintained a level in the price of labor, except as it has been kept up by this kindred organization of the laborer himself?—A. Yes; the tendency has been to keep up the price of labor.

Q. And the employee is pursuing the same course as that of the employer; that is, he is forming a trust or combination of his own?—A. I look upon it as the same thing.

Q. And his reasons are the same as yours?—A. Precisely.

Q. To increase his earnings?—A. Yes; and to keep out competition.

Q. To increase his earnings and keep out competition?—A. That is about it. Not necessarily to increase his earnings, but to maintain and keep up the price.

Q. I don't mean to intimate that your trust is always begging for more, but is it not the tendency of these organizations of labor to demand more pay and less hours?—A. Well, when labor is well organized it generally demands all that it can get.

Q. There is no difference between the individual and the corporation; each is struggling for benefit?—A. Well, there is the proposition presented by Mr. Ratchford, that the corporation gets privileges that the individual does not.

Q. It is an artificial person made by the State?—A. Yes.

Q. And given privileges?—A. Yes.

Q. And if I go into business over here, individually, and anything goes wrong with the laborer, he puts his finger right on my head and says: "You are responsible and you must correct it." It is generally conceded that the corporation is more difficult to reach. Now, the idea has been suggested by many of the largest combinations in the land that, as this artificial individual is created by the State, the State should regulate it. It has been suggested by some of the representatives of the biggest companies in the world that there should be legislation by the same power that creates this artificial person, providing for the inspection of the same, or something similar to the national-bank inspection, to see that it is not overcapitalized and to see that it does not abuse the power the legislature has given to it. Do you see anything radical in laws of that kind?—A. No.

Q. One of the questions speaks of the hours of labor. You have an 8-hour law?—A. Yes.

Q. You have had no experience with that?—A. No.

Q. You don't know whether there would be any real development in working the mines on the 8-hour shift or not?—A. There is no development.

Q. In other words, is it not contended, not speaking of the pump men or those on like jobs, but of the miners under ground, by many operators that they get as much labor out of 8 hours, as much actual work in the mine, as they get out of 10 hours, where they permit the employee to get dinner on the time of the employer?—A. There is no general objection against it, so far as I know, among the operators. It is about one and the same thing.

Q. Now speaking of the watered stock. Have you ever read of the history and origin of watered stocks as written by the bookmakers?—A. No, sir.

Q. Do you believe that a corporation, created by the State for the benefit of the people, should be allowed to have a fictitious valuation in the way of the so-called watered stock?—A. In other words, should they be entitled to common stock?

Q. Well, you may call it any stock. The writers call it watered stock.—A. I believe they should on this theory: that the common stock of a corporation is similar to the unearned interest on real estate in the city. If you buy a piece of real estate in the suburbs of this city to-day, worth, say, \$20,000, you have the money stored, and it does not bring an increment; but say in 25 years or less time than that, and without any effort on the part of the man owning the property, it will increase to fifty or seventy-five or a hundred thousand dollars—many of the great fortunes of the United States have been made in that way without any effort whatever on the part of the man owning the real estate—that is what Henry George terms the unearned increment. The population gradually increases until the suburban real estate gets to be city property, and has greatly increased in value. Where a corporation spends its money in a new community and that community builds up, and people settle there and make a city that would have been beyond the imagination of any one when it first started, all due to this corporation—say you build a railroad from Nebraska, as was done some 30 years ago out here—you have no idea of the increase in the value of real estate and the vast amount of business that comes in; now is not this corporation entitled to the same consideration, the same increase in profits as the real estate owner? The community receives double the advantage that the road receives. I look upon this common-stock case precisely as I do the unearned increment on the real estate in a growing city.

Q. In the purchase of the different smelters was the cost of construction taken as the measure of value in making up the preferred stock?—A. Yes.

Q. Was there anything put in for the good will and reputation of the plants?—A. Limited amount; small amount.

Q. Then your preferred stock largely represents the actual value?—A. Yes; the preferred stock largely represents the actual value of the different institutions, with the amount of cash that we have on hand; but there is very little put in for good name and reputation, experience and skill in the business. I suppose skill in the business would go on just the same; same employees running the business.

Q. It economizes in the way of reducing managers and many fixed expenses, does it?—A. We had so large an outlay that, if not too cumbersome, the natural disposition would be to do that.

Q. Do you recognize that there are many combines that abuse their powers?—A. Yes; I do.

Q. Taking that view, can you not suggest some remedial legislation that would protect the public?—A. Well, it depends upon what the corporation is and to what extent the public is dependent upon that corporation. In this particular business I don't know of any legislation that is needed; in other words, we are conducting the business precisely as we were before; we are paying just as good prices to miners; our strike was caused by a difference in the amount of the advance to be made, and not on the question of cutting labor. Now, I can not see where the consumer expects to be damaged by this corporation.

Q. In the papers it stated that by reason of the shutting down of the Durango smelter—which was in the trust—750 men were thrown out of employment; that is, the men at the smelter and miners. Is it your opinion that if the individual smelter had not gone in the trust it would have shut down at that time?—A. I don't know. You can not tell. As a consolidation naturally we felt stronger than we did as individuals. The smelter corporation or company is not dangerous, but it has to be guarded in its actions. Not having generally a great amount of money we had to be very careful, but this combination, having plenty of money in its treasury, is more powerful.

Q. How many individual smelters in the State are connected with the combination?—A. Seven.

Q. Would it not be the natural tendency, having the power to do so, to shut the smelters down and then settle with your men on better terms than if only one or two were shut down?—A. I think so.

Q. And is not that dangerous to the best interests of the different communities and the different employees?—A. Well, it might or might not be.

Q. But the power could be wielded?—A. It would be entirely owing to the disposition of the combination.

Q. If a combination owning, say, seven smelters in this State, as you say your combination does own, all being under this one great power, could shut one of them down, say, at Leadville, and smelt the ores either here or in Omaha or Durango, would not that make the men very timid about building homes and feeling that they were, in a way, a part of your institution?—A. I guess that is so.

Q. Don't you think it would make them less liable to build homes, and that it would take the confidence out of your men?—A. I think that has been the tendency; yes.

Q. And has it not been the experience of the different writers upon these subjects, and your own observation of all institutions like this, that if they have more capacity than the demand requires they dismantle one of the works here and one there whenever the conditions are not favorable?—A. Yes.

Q. And that they even dismantle the works where the men had built homes upon the theory that it was an institution that would be permanent?—A. Yes.

Q. Don't you think these things are really a dangerous innovation upon our methods and really destroy the home-maker?—A. It does to a certain extent. But I want to say right here that all places are not similarly situated for manufacturing purposes, and we go where the most favorable places are, where we find them to be so by years of experience and work; and the very fact that these separate companies, some of them, were at unfavorable locations, ascertained to be so after years of experience, although I don't care to say where those places are, had a good deal to do with this consolidation.

Q. The fact that some places were unfavorable brought about this consolidation?—A. Yes; that had a good deal to do with it. Some of the companies were altogether out of line with the mines, and it was the knowledge of this fact that had to do with the consolidation. The knowledge of the fact that some places had natural advantages over others made it possible to bring about this consolidation.

Q. Does not the great combination of capital in manufacturing in any line have a tendency to congest the population at certain fixed centers, instead of keeping it distributed throughout the country?—A. I think so; yes.

Q. And does it not have a tendency to destroy the building up of small localities?—A. Yes; the small locality is a good deal like the smelter business under existing conditions.

Q. Under this universal tendency now apparently predominating to create great combinations?—A. Yes.

Q. Will not the natural result be that every necessary of life, I might say every necessary produced in the manufacturing industries, will be represented by one unit, practically—that is to say, the smelting will all be under one head, the refining of sugar will all be under one head, all done in one refinery, or rather by one company?—A. That is undoubtedly the tendency.

Q. Won't that also necessitate every man of brawn and muscle going into a trust; the men who are engaged in working in the smelters will be united, and the men working in the sugar refineries will be united; and won't the tendency be that every line of labor will have to form a trust to protect itself, and that they will have to work together, issue general rules and have laws to govern these different organizations or units—have everything that is material to a new evolution?—A. I think that is so. I am simply a feature of that. I find myself in a business under conditions that necessitate a change, and the combination is the only outlook that I see.

Q. Is not that true with every institution of that kind?—A. I think it is.

Q. Even with the laborer himself?—A. I think so.

Q. Now, something must be done in the way of legislation to govern this new evolution. Have you studied it sufficiently to suggest anything?—A. Not sufficiently to suggest the line of legislation.

Q. I want to ask you about coal mining. You say you never had any experience in the practical part of it; do not know anything particularly about it; but I take it you use a great deal of coal in your business, do you not?—A. The Colorado Fuel and Iron Company has practically the control of the coal mining here. You see the coal mining of the State is practically in the hands of that company.

Q. Is it not your understanding that no individual can operate a coal mine because of the lack of facilities of transporting on the railroads?—A. I don't think it is altogether, although it may enter into it. The large company has its agents out at every point, and they can supply a great variety of coal, and very naturally they distribute the business under these conditions, whereas the single coal man has but a single kind of coal to supply. In our smelting business we use several different varieties of coal, and naturally we seek the company that can furnish us every variety we need.

Q. Have you ever known of the fact that the railroads generally, not only in Colorado but in all States, have universally, in recent years, refused to fix a rate that any ordinary individual could handle an ordinary coal product at? Has not that been the tendency?—A. I think the tendency has been that way, but I am not familiar enough with it. I don't like to leave the matter that you stated there, about the trust smelters being closed and the others not—I don't think it is exactly fair to leave it just in that way.

Q. Make any statement you desire to.—A. I want to say that at the three plants owned by the trust, one at Durango and two at Leadville, the wages offered would average over 40 cents per day beyond the rates paid by the individual smelters that are in operation; and the rates that are offered here at the Grant plant in Denver are precisely the same that the men are working for at the Argo smelter right across the river from us.

Q. Then how do you account for the Argo smelter running and yours being shut down? What is the principal cause?—A. The cause of this trouble came up naturally by the 8-hour law. The wages demanded by the men were practically the same for 8 hours as they had been getting for 10 and 12 hours. We met the proposition practically and restored the rates that were paid in 1892, and that was done on the 1st of June and before the law took effect on the 15th. There was naturally a good deal of feeling in every community about the consolidation. I am giving you my individual opinion of the situation. The men at the different plants formed a union, feeling that they might take advantage of this feeling in the community; and also seeing from the representations made in the newspapers that our organization was going to put stock on the market, they thought if no dividends were paid the stock would go to pieces, and they were disposed to take advantage of that situation, and did not expect we would shut down on account of stock that they thought we were going to put on the market. The feeling was that in no instance would the men continue at work for us, but that they would for the individual companies. I think that feeling existed to a large extent and had something to do with the strike. In any event they expected that on the 15th, the day the law was to go into effect, we would rather concede their demands than shut down. We, acting under the advice of attorneys, posted a notice that our contract with the men would be for 8 hours, leaving it optional with the men to work longer if they chose. Of course the men had a great deal of feeling about this 8-hour law, and they felt it was a tendency on our part to violate it. A good deal of feeling was engendered because of this notice on the 1st of June—the feeling that we did not propose to stand by the 8-hour law.

Q. But you left it optional with them?—A. We left it optional with the men to work longer if they chose. We knew that probably many men would want to work longer, unless they got 10 and 12 hour wages for 8 hours' work. To pay them for 8 hours' work what we had been giving for 10 and 12 hours was more of an advance than the business would stand and leave any profits; to do it meant an advance of 33 per cent. You see the 10-hour men wanted the same wages for 8 hours as they had been receiving for 10, and would not deviate from that a particle. Our men have practically stood out, the 10-hour men, for \$1.60 for 8 hours' work, and with the advance on June 1 that would have made \$1.75 per day. The men are working at the Philadelphia smelter and at the Argo smelter for \$1.40 per day at present. Both of these companies pay \$1.40 now for 8 hours' work. So you can see what we offered our men was equally as good if not better.

Q. (By Mr. RATCHFORD.) For doing the same class of work?—A. Yes.

Q. Do you know whether these companies had any tentative arrangement for other rates, provided the 8-hour law was held constitutional?—A. Senator Hill had an arrangement with his men that there would be some adjustment of the scale; I don't know what it was, but he would not take any further steps until the matter was settled.

Q. Have you trust smelters also in Omaha or Salt Lake?—A. Yes.

Q. Have you any in Cheyenne?—A. No.

Q. Are you collecting ores now the same as you did when your smelter was running? You are purchasing ore right along?—A. Some.

Q. There was more difference in the price offered for the skilled labor than for the common labor?—A. Wherever the work is the same the prices are the same. The price at the Grant smelter was precisely the same in every particular. Our proposition was that when the law was finally tested these men who wanted to work longer hours could do it then on this higher scale, \$3 for \$2.50, and so on down the line. You see there are three scales of wages at our plant. These are the wages we paid in 1882 and running to 1893 through the most prosperous period in the history of Colorado, and there never was a word of complaint about these rates. Now we have restored them; we restored them on the 1st of June; they were all perfectly satisfied; and I know just as well I know that I am sitting here that we would never have had a strike had it not been for this 8-hour law, if you come right down to it; but having closed down our works we are having some little trouble in getting back to our original scales and adjustment, but we will get back in time and go ahead with our business; there is no question about that.

Q. Did you ever have any trouble with your employees before?—A. Not of a

serious nature. There has not been a change but once for a period of 20 years that I have employed labor. I should like to make a further statement: At Omaha the wages have been advanced, where there has not been any trouble with the men. The wages were advanced the 1st of June. In Utah there has not been any special change; the 8-hour law is in effect in Utah.

Q. You are working 8 hours there?—A. Yes.

Q. What kind of satisfaction does it give there—I mean the 8-hour law?—A. So far as I know there is no complaint about it.

Q. Everything is satisfactory there?—A. More or less so. I have not been out there yet to go over those plants to see whether they are running entirely satisfactorily.

Q. (By Representative BELL.) You say you are buying ores now; is not that by reason of the fact that with the combination owning smelters in Utah and in Omaha, you can divert the ore from these smelters here without any great loss, and send them to Omaha or Utah?—A. Only a limited amount.

Q. Much of it you can not afford to ship?—A. No. You see, these smelters here were handling about 3,500 tons per day.

Q. How much of that can you divert?—A. Only about 300 or 400 tons per day.

Q. (By Mr. RATCHFORD.) You can then, to the extent of 300 or 400 tons per day, transfer the business from here to the smelters in other States by reason of this trust?—A. It is in our power to do it, but we are not doing it to any great extent. The only place where I think it is done is where certain mines want to ship. It is done to accommodate them.

Q. And if there was no trouble between yourself and the workmen the ore product of these mines would be smelted here?—A. Yes.

Q. (By Mr. KENNEDY.) In these individual smelters that you spoke of were the employees working for less wages than you offered your men?—A. No, not less. I don't think they were.

Q. For the same wages?—A. Of the different scales of wages at all of these smelters the Argo was the highest; the Grant plant, known as the Omaha and Grant, was the next highest, and the advance of 10 per cent added to the scale at our plant, the Grant plant, put the scale on the same basis as the Argo. The others were a little below that. Wages in the mountains, in Durango, for instance, are higher, as it is out of the way and more expensive to live—less population around there from which to draw supplies; and wages have been lower here by 40 or 50 cents per day—even the union labor.

Q. Are the men who are employed in these smelters that are running now members of organized labor?—A. Yes and no. In the Argo, I don't think they are.

Q. They are in some of them?—A. In the Philadelphia they are.

Q. I want to ask you if there is a question of the recognition or nonrecognition of organized labor that is the real difficulty in the way of an amicable adjustment of this strike?—A. No. I don't think it is the real difficulty. I think the only question now is one of wages, and I decline to deal with the men through the representatives of the union.

Q. If you were to recognize these men do you believe you could bring about an amicable adjustment of the strike?—A. No; not in the absence of a satisfactory wage scale.

Q. You would be willing to pay the same scale these independent companies are paying, would you not?—A. I think we will in the long run, but the independent companies have not a permanent scale; they have a temporary scale to tide over the difficulty during the summer months.

Q. You are not opposed to organized labor are you?—A. No; I have no opposition to it unless it threatens my business; never had the question come up during my 20 years in business; men belong to it and dropped out of it several times; I have never had any dispute about the question; it never came up.

Q. Don't you believe the men have such an interest in the business and its prosperity that they would not attempt to injure it for their own sake?—A. The men want the highest wages they can get, and let the corporation take care of itself; I think that is largely the spirit that prevails, so far as the increase or decrease in the earnings is concerned, I think they say that the managers will have to take care of that part of it.

Q. I judge from your testimony on the combination of capital and labor that you believe that the men will get a better share of the profits which they create by belonging to organized labor than by treating as individuals with corporations?—A. I think the tendency in this State has been, in all industries connected with silver, gold, and lead mining, toward continuous employment; there have

been very few changes in very long periods; I don't imagine, if we get to work again, that we will have a labor question arise or any difficulty with labor come up for years, unless some unseen circumstances arise. I have been in the business now for nearly 22 years, 4 years in the mountains and 18 years in the valley. From 1882 to 1893 we ran precisely on the same scale. The wages in 1893 were reduced 10 per cent owing to the fall in silver. Continuous employment, without difficulty of any kind, has, as I say, been the rule. The lessening in the production of ore meant an enormous loss to the smelters for a year or two, so that the rate was reduced 10 per cent, and we have not any smelters that have been making any money for the past 5 or 6 years, yet there has been no change in the price of labor paid in the Omaha and Grant until this advance in the wages of 10 per cent the first of June, which restored the wages that existed in 1892.

Q. Did I understand you to state that you believe that the combination of capital going on in the industrial world makes necessary the combination of labor?—A. I don't think it makes it necessary; I think it is the inevitable tendency.

Q. You believe it will be beneficial to labor, don't you?—A. If they are moderate and wise in their actions, I think it will be; if they recognize the rights of the corporation and the rights of the community, etc., it is; if they operate wisely and judicially and are moderate in their dealings with corporations, I think the organization a good thing.

Q. You believe that if the corporations exercise wisdom and moderation and the employees exercise wisdom and moderation it will bring about a golden period for both labor and capital?—A. I think it will bring about a better state of feeling than exists to-day, a more harmonious state of feeling. It is the failure to do it that results in the antagonistic position they occupy to-day—the failure on the part of the men to recognize the rights of the company.

Q. (By Representative BELL.) You stated, if I remember rightly, that there is some importation of labor in this State; is it generally colored labor?—A. No; that was in the strike at Leadville; they brought in a good many Missourians.

Q. They have not brought in the cheap colored labor of the South?—A. I am not sure. The Colorado Fuel Company did bring up some men at Pueblo. There never has been a strike in the smelters in this State to speak of, and there has not been a smelter shut down in the State until we shut down in June. The Colorado Fuel Company had more or less strikes among the coal miners, etc.

Q. (By Mr. RATCHFORD.) Referring to the statement made as regards the tendency of capital to consolidate, you have stated, I believe, that such tendency was present, and, in reply to the question which Judge Bell put, added that if such should be realized actually one individual would control, for instance, the refining of your smelting of ores and the other industries of that kind. The tendency is that way now?—A. Yes.

Q. Now, if the tendency should be actually realized, there is where we would finally land, isn't it?—A. Yes.

Q. That being the case, every man who has labor to sell would be obliged to deal with that one man?—A. Yes.

Q. That being true, does it not follow that the workman who might be charged with having committed some violation of the rules or discipline of the factory, or who might give offense to his superintendent in any one of one hundred ways which might arise, might find himself out of employment not only there but everywhere that he would turn?—A. That result might come about. It might be possible.

Q. That being true, we will assume that the workman knows nothing else but the refining of oil or the smelting of ore, is it not time that we stopped to consider the result?—A. Yes; I think it is.

Q. He has no other shop, no other factory, no other mill open to him, because he knows nothing about any other trade, and the trade in which he has been employed he finds closed against him.—A. That is an extreme case in a growing country. We have not reached that here.

Q. That is an extreme case, but with the tendency we speak of, that we now fear or anticipate, will it not be worse ultimately everywhere in the whole land?—A. Yes.

Q. Some time previous the admission was made that the laborer under any condition, so far as the wage system prevails, will sell his labor in a competitive market. That being true, does it not also follow that as a matter of justice a man should have a competitive market open to him in which to exchange that wage for the necessities of life?—A. Yes; I think that is so.

Q. If the production of all articles of common use be controlled by combinations and trusts, where is that open competition?—A. Well, there would not be any.

Q. Then it simply means this—and if it is not your understanding, I want you

to correct it—that the laborer is obliged to earn a living in a competitive market in which the cheapest man, all things considered, will always find employment, and that the competitive market, so far as production is concerned, is closed, wherein he may exchange that wage for the necessities of life for himself and his family, and he must pay a trust price for everything he uses. If that statement is not correct, I would be glad to have you change it.—A. Well, the statement is a little extreme. When a manufacturing establishment or enterprise is well on its feet and well under way, there is no desire to change its labor where it is satisfactory. From 1893 to 1897—I think the laboring men who were employed at our smelter here would be willing to testify that there was no time in that 4 years that we could not have reduced their wages from 25 to 40 per cent and have filled their places at the change of a shift. If it had been merely a matter of competition we would have turned our old men out and taken in new ones, but I don't believe that any manufacturing establishment or management desires to-day to change its labor, and that it will pay a higher price for that labor rather than take the extreme advantage that might be taken in times of excessive competition.

Q. Did I understand you to state that in 1893 your workmen had their wages reduced?—A. Yes.

Q. Did they submit to that reduction without resisting it by striking?—A. Yes.

Q. Does that not of itself indicate that they were willing to share with their employer in the depression?—A. Well, of course I know of that feeling, and they accepted it as inevitable. It was that or nothing. There was nothing else to do. People saw the streets of Denver filled with thousands of persons, traveling from east to west, trying to get employment if they could. There was an enormous surplus of men everywhere throughout this section of the country, and these people could not get work at any price. Railroads reduced their fares and all industrial enterprises of every kind laid off 20, 30, or 40 per cent of their force, and we made the reduction under the peculiar stress of circumstances. We were making no money—in fact we had lost an enormous amount of money through the fall in silver, and we made the reduction very reluctantly. I don't agree with the proposition that labor is forced to get employment entirely on a competitive basis.

Q. Wherein do you differ from that?—A. I differ from that in the belief that there is still a feeling on the part of men who employ labor, manufacturing institutions, that takes into consideration the expenses, cost of living, and figures out the whole proposition—how much they can afford to pay their labor and exist and make what we call a decent profit. There have been many years here, in this period of depression, when we knew absolutely that the men would have submitted to a reduction of 25 or 30 per cent in their wages, and would have accepted it and gone to work, when we were barely holding our business together and paying no dividends.

Q. But at the same time you believe when you pay them a little higher rate of wages you have men employed such as would give you the best possible results or returns for the money paid?—A. Yes.

Q. Then that leaves the proposition good that is made as regards competitive employment?—A. It is.

Q. You take the position, generally, that it is a matter of competition?—A. It might be. The majority of men will employ the cheapest labor.

Q. Now, you spoke about the recognition of the union of your workmen. I understood you to state that you declined to treat with their committees?—A. Yes.

Q. Did you decline to treat with the committees because they were representing a union, or because the action of that union in this respect is not in keeping with a spirit of fairness?—A. That is the way we look at it. We are afraid of the future.

Q. You are afraid of the future?—A. Yes.

Q. Then you are not of the belief that their action at the present merits your refusal to treat with them, but rather the action that you anticipate from them at another time?—A. Well, the action that I anticipate from the knowledge of what has taken place in their councils.

Q. I should like to have you make as full a statement as you would like to make as to why you have taken this stand with reference to treating with organized labor.—A. We have taken the stand and we have talked with the men just as fully as with anyone else and stated to them that their general tendency, and the general tendency of labor organizations—not so much the trade-union people, but the labor organizations in our mining districts here in the West—has been to be very arbitrary. When they get strong enough their first scheme is to allow no nonunion men to be employed at a place where they are employed. They want

to govern the nonunion men's employment, and when they get in complete power, if there is any foreman that is the least objectionable to them they will make a demand that we displace him, giving certain reasons why he is not the right man, and you must act in conformity, must get another foreman, or they strike. And these are the chief reasons why we have taken the stand we have in this matter—that is, the arbitrary and dictatorial manner in which they undertake to deal with the employees who are not in the union, when they get strong enough. Another immediate incentive to it was, when this 8-hour law was passed, and which was to go into effect here in June, there was an arrangement made to have the federation meet us just before the law went into effect, and unusual efforts made to organize these men. People were sent from Butte, Mont., and they got organizers from Cripplecreek and other parts of the State, and were exceedingly active and powerful; you might say, almost forced the men into the union. A great many of the men employed with us said they did not want to go into the union, and it was made exceedingly disagreeable for them not to go in. Exceedingly violent speeches were made at the convention on the 3d, 4th, and 5th of June, and every employer of labor was denounced as the enemy of the people if he did not see fit to employ only the members of their organization. There was also more or less indignation expressed at the action of the governor of Idaho, because of the position he had taken, and because of all these features in the convention there was a particularly bad feeling stirred up between the employer and employed, and more especially by the violent speeches; so that we decided that we would not deal with the organization, especially under these peculiar circumstances, feeling that it was only a question of time when they would demand the plant, and that we could do nothing with it. Then we had a peculiar experience in this State at Cripplecreek and at Leadville, in the springs of 1894 and 1895. There was a good deal of violence and the entire shutting down of the mines, men killed, shaft-houses blown up, and property destroyed, and threats made against the men. This made me feel that it was to the best interests of the company I represented not to deal with the union.

Q. Have you ever dealt with the union prior to this federation convention; have your men ever been organized?—A. At different times, yes; organized during 1892 and 1893.

Q. They have never had an organization as strong as now?—A. Not always, I imagine. After 1893 there was no organization at all.

Q. But they were organized in 1893, were they?—A. I am not sure as to that. The men said that they were generally satisfied with the wages and never found much interest in the organization.

Q. Speaking of the fear of resorting to extreme methods, if men in 1893, after a period of 5 and 6 years of the most prosperous times your State had ever seen, when mining properties were of more value to the foot than ever before, these same men, when the crash came, were willing to share in the consequences and gladly submit to a reduction in wages without a strike, do you think there is anything to fear in the way of extreme measures from these men, if you still have the same men in your employ?—A. A good many of them are the same; probably the majority.

Q. At the same time you express a desire and willingness to treat with organized labor, provided it is conducted upon conservative lines, recognizes business conditions, and refrains from resorting to extreme measures at any time. You would treat with them at any time under those conditions?—A. Yes; I have no objections.

Q. The effect of organized labor on wages, according to one of your statements, has been very beneficial.—A. I think so.

Q. Has there been a time when the representatives of your company and your workmen have met together, either separately or in company with the representatives of other concerns and the workmen of other concerns, and fixed wages?—A. Yes, sir.

Q. Wages have been agreed upon by the employers and agreed upon or accepted by the workmen; is that the general rule?—A. Well, we established our smelter in 1882, and we started out with the Argo scale of wages. That plant had been running 2 or 3 years, and that has been followed up without any change except in 1893, when the reduction was made of 10 per cent, and the restoration to that in June of this year.

Q. Do you believe in conciliation and mediation between the employer and the employee?—A. Of course.

Q. Do you believe that good results are usually obtained by such conciliation between the organizations of the respective sides?—A. Well, I have had no personal experience.

Q. Is it not a fact that you never will have any personal experience until there is intelligent organization of your workmen; that if you refuse to treat them as organized bodies you can not conciliate or arbitrate with them?—A. We can deal with the men in a conciliatory manner without dealing with the organizations. In different departments of the work, that is what I am undertaking to do now.

Q. Will you carefully explain to the commission how negotiations are carried on between the workmen and the company in such a manner. Is it by dealing with the men individually?—A. Yes. Our men are divided into different departments and work for different wages, and we call these men together in my office, 30 or 40 or 50 of them, as the case may be, and find out what they may have to say about the situation. We ask each man in turn what he may have to say and let him give expression to his thoughts as to the situation. We meet the men in every department in the same way, and after a while we will find out what they want and they will find out what we want and we will make some arrangements.

Q. Do you find that men under such conditions will give free expression of their thoughts?—A. No, not entirely, except where they have agreed beforehand, and have nominated a speaker.

Q. And that speaker will give the views of the body of men in his way of thinking?—A. Oh, of course you could only get the exact views entertained by different men by seeing every man personally, and that we could not do.

Q. Well, I did not mean to insinuate, and won't do so, that you or any member of your firm would punish a man for giving expression of his opinion, even though he differed from you, but I submit that you, in your experience and business, have known men who would punish a man for giving expression to his thoughts; you have known men who would drive him out of their works, have you not?—A. I guess so.

Q. All of this restrains a man from giving expression to his views. It places him in a position in which he will say one thing to his employer, and may say another thing or give free expression to his views at a time and place where and when it is not dangerous to do so.—A. But the one who won't express his opinion now is the one who is in the union. Out of 50 men in that room where we met, there was only 1 man who got up and said he would rather work longer hours if he got more money. There is not a workman in our place who is afraid to talk to me about the 8-hour law or anything else. I would not meet them unless I knew they were perfectly frank and free to express their opinion. The trouble was to get the men who were against the 8-hour law to say anything about it.

Q. (By Mr. KENNEDY.) The evidence is that the union is very powerful?—A. Very powerful.

Q. (By Mr. RATCHFORD.) Do you care to state in a general way the advantages or disadvantages of the shorter workday, in your judgment?—A. It indicates a prosperous condition in the community where you can afford to pay a man only for 8 hours work what money he feels is required to support him and his family, and the business that can do it is undoubtedly a prosperous one. And there is no man who would be more delighted than I would be to know that this country was in such a condition that every workman could make a reasonably fair living by working 8 hours instead of 10 and 12; but the serious question here is how much you can afford to pay for 8 hours' work without crippling the business that is now making this State prosperous—that is, the mining and smelting business, and at the same time make any profit for the people who are putting up the money and doing the smelting and transportation business and so on. Of course it is difficult to say just what the advantages are. No man works except from necessity—that is, very few of them do. I never enjoyed a day of working. A great many people say they never have any happiness except from work, but I never worked except from necessity; never did a lick of work except from necessity and never will; and I look upon work as something to avoid, except as a necessity to support your family and get what you want of the luxuries and necessities of life. I have no use for work except as I am obliged to do it and get what money it will bring. I take it for granted that is what everyone works for, and submits to hardships and disagreeable work because he is obliged to do it to get his living. There are no disadvantages to the 8-hour law except as it may force a higher price for labor, and thereby retard the development of these industries peculiar to this State.

Q. I know you have given consideration to the other side of that proposition. If the hours of labor continue the same this year and next year and for some years to come as they have been from the beginning of the development of the mining industry of your State, say 20 years ago, in view of the improved facilities for production, is it not your opinion that a constant cheapening of prices will result? A greater number of men working the same number of hours per day,

machinery aiding in putting this mineral on the surface and putting it through the proper process for the market—with all this will there not be so much production in excess of the market requirements that it will tend to the constant cheapening of the article, whereas by shortening the days of labor that danger will be avoided, at least to some extent?—A. Yes.

Q. You believe that?—A. Yes; that is what I believe; but that is not like the statement of the man who says he will do the same work in 8 hours that he has been doing in 12. I don't believe he will do that. The same number of hours of labor with the improved machinery tends to produce more and more year by year, no matter in what business, with the improvements that are going on in machinery. There is no question about that.

Q. I was going to put that proposition in another way, more concisely. Is it your opinion that the hours of labor should be reduced to a reasonable point in proportion to the increased production of labor, aided of course by machinery and modern devices?—A. I think if it is not done the tendency will be to have a great deal of surplus labor, and naturally that makes discontent and idleness.

Q. The commission understands that the present trouble between the smelter operators and the operatives is pending the decision of the court?—A. Yes.

Q. If the court holds that the 8-hour workday act is constitutional, do you think the employers will grant the 8-hour workday?—A. Nobody resists it now; the wage is the question. When we posted a notice on the first day of June we specifically notified the men that no man would be employed for more than 8 hours, but that any employee of the company who desired to work longer might do so, but that we would not employ any man for longer than 8 hours, leaving it entirely optional with the men.

Q. That included all of the men working around the smelter?—A. Every man working around the smelter; every single man. The law was universally respected by the corporations, leaving it optional with the men if they chose to work longer.

Q. To work more than 8 hours?—A. Yes.

Q. You still adhere to that position, do you?—A. Yes; we still adhere to that position. I spoke about two plants only as running. The Bimetallic is running now, but only allows the men to work 8 hours; that is at Leadville; it belongs to this corporation.

Q. Then it is a question of wages rather than a question of hours?—A. Entirely so. The question is whether the men will take \$3 for 12 hours' work or \$2 for 8 hours' work. There is any quantity of men working for \$3 for 12 hours. If we were to say a man could only work 8 hours and would only get \$2, he would say, "I must have more money than \$2 per day; I am not satisfied with that; I will go somewhere else where I can get more money."

Q. Does your smelter run the year round?—A. 365 days for a year. At the Grant plant, from November, 1882, until the 14th day of June, 1899, the fires had never been out in the smelter. Repairs, of course, have been made, closing one furnace or another for a time; but the works as a whole have been running constantly.

Q. After deciding to grant the men the 8 hours, except where they desired to work longer, you wanted the way open to them to work longer?—A. I did not say I wanted it. It would be hurtful to the business not to have it in that way.

Q. I understood you to say it was the decision of the company to accept the law and leave the men to work longer if they wanted to?—A. Yes; that was the position we assumed on the 1st day of June, when we posted a notice 15 days before this law went into effect, to begin on that basis the 1st day of June; and every man worked for the first 14 days in June his original 10 hours or 12 hours; but the men stood together pretty-solidly on the basis of 8 hours, and said that they would work for it. It had been brought up by the unions and supported by unions outside of the State, and the law finally went through without much discussion, and of course that was a kind of surprise to the people who didn't know what it really was. Mr. Patterson said he hardly knew such a law had been introduced when it was passed. It was the changed conditions and evolution of things that had brought about the agitation. The men struck and we shut down. If a man says he must live and he can not get it in the 8 hours, and is perfectly willing to work for \$3 and 12 hours, he should be allowed to do so. Now, I had that up with the men yesterday; I told them, If you want to make more money, you can work the 10 or 12 hours, and we will pay you so much an hour; that these furnaces will run just so much anyway, and that though you say you will do more work in 8 hours, according to the proportion of time, than in 12, yet there is only so much can be done; the furnaces will hold only so much, and we can not get back anything on that increased work, because there is only so much to be done in the 8 hours, and you can not do any more in that time. To prepare for more work

under the present conditions would involve a large expenditure of money, and would take time to get prepared for more work, but that in time we will have to do it. If the 8-hour law is fixed and a man gets an advance of 30 per cent in his wages he will be expected to do more work.

Q. If the 8-hour law is not upheld, is not declared to be constitutional, will it not be the tendency of labor in all departments throughout the country to work a less number of hours?—A. I think so.

Q. One of the inevitable consequences?—A. I think so; I look upon it in that way.

DENVER, COLO., *July 13, 1899.*

TESTIMONY OF MR. JAMES T. SMITH,

Deputy State Labor Commissioner of Colorado.

The subcommission on mining met at 10 a. m., Representative Bell presiding. James T. Smith, of Denver, Colo., being duly sworn, testified as follows, the topical plan of inquiry on mining being followed:

Q. (By Mr. RATCHFORD.) Please state your full name, address, and business in which you are engaged.—A. James T. Smith, deputy State labor commissioner, 1312 Tremont street; room 27, State Capitol building, is my office.

Q. How long have you served in that position?—A. Since March 6, 1899.

Q. And prior to that time what were you engaged in?—A. Mining.

Q. What kind of mining?—A. Metalliferous ores, leasing and working as a miner in the Leadville district.

Q. That occupation you followed how long?—A. Off and on since 1880.

Q. The knowledge gained while following that occupation will enable you, I presume, to speak for that side in a general sense?—A. I think so; in a measure at least.

Q. Have you had any connection at any time with coal mining?—A. No; never have.

Q. Have you any connection with mining at present?—A. No.

Q. Does the department of labor, with which you are connected, collect reliable data as to the mining conditions of the State?—A. Yes. It publishes a biennial report, supposed to cover everything with reference to mining of all kinds, and agricultural labor and the related subjects. I am making quite an extensive inquiry along these lines at the present time for the purpose of obtaining a full and complete knowledge of the industrial conditions of every character throughout the State. It will be published later on.

Q. You will note that Part I of the plan of inquiry relates to the organization of labor and that side of the labor question, and that Part II covers the capital side of the question, while Part III relates to legislation. I think that, as deputy labor commissioner of your State, you should treat the whole matter as fully as you care to, and the commission will be pleased to have you do so in your own way.—A. I have been connected with labor organizations steadily since 1878, and I have a fair knowledge of the constitutions and regulations of these labor organizations with which I have been identified.

Q. In a general way, the commission would like to have your knowledge of the constitutions of these organizations; and to have you state if they have any particular features that may be of interest, such as beneficial features or any other features that may be advantageous to the workingman or may be injurious to the workingman or to society.—A. The constitutions and regulations of all the labor organizations that I have been identified with or have any knowledge of instill a high regard for law and order and sobriety and everything conducive to the elevation of the individual personally and the advancement and growth of society generally. They aim to create and establish a union for the purpose of aiding each other in times of misfortune, and usually have benefit features, varying according to the amount of dues exacted from each member and according to the needs in that locality, in case of accident or sickness, or any condition whereby the individual is incapacitated from labor.

Q. What can you say of the growth of trade-unionism and labor organizations in this State?—A. The growth of trade-unionism in this State since 1880 has been somewhat checkered. At times it has grown rapidly, and again it has had a backward swing, and then it has gone forward. At the present time, as nearly as I can determine, I should say, at a rough estimate, that about 25 per cent of the

employees in all of the industries in the State of Colorado are enrolled as members of some one of the different labor organizations. That is about the proportion, in my judgment, of the workmen of the State as a whole—the entire State; and certain kinds of employees are organized greatly in excess of that.

Q. (By Representative BELL.) You might take it by fixing the vocations.—A. The coal miners of the State, according to the report of the Coal Mine Inspector for 1898, number 7,425, and nearly that entire number are enrolled as members of organized labor of the coal miners' union. As for those engaged as employees in metalliferous mines, taking the State as a whole, as nearly as I can determine I should say perhaps 70 per cent are members of the union. The railroad employees are practically all identified with the organizations peculiar to their calling.

I am not a constitutional lawyer or any other kind of a lawyer, in fact, but the incorporation of trade-unions and of labor organizations of every description is, in my judgment, highly to be commended. Good, helpful, and beneficial results would, I believe, follow the incorporation of unions. I see no reason why it is not legal, though I don't think I am competent to pass upon that point.

Q. May I ask you, where you are not incorporated, how you hold the property of the organization, for instance the hall, etc., if you know?—A. I am capable of answering that question. Now, an organization with which I am connected in Leadville, which is not incorporated, has property worth some \$7,000 or \$8,000, and we hold it through trustees for the benefit of the order. We hold it through trustees called a hall committee, appointed by the different organizations represented when we purchased the property.

Q. Are there any incorporated organizations in this State legally incorporated, or are they just ordinary associations?—A. They are entirely so, so far as I know.

Q. Then you have not studied the benefits they might derive from an incorporation, making it a legal person?—A. No; I don't know that. I think that the title of their property might be more secure.

Q. Well, the responsibility of the organization—have there been any legal proceedings against your organization as an organization?—A. No.

Q. No attempt to affect your property in any way by legal process?—A. No. Of course the legally incorporated body acquires certain rights and also certain responsibilities.

Q. But as to whether one is better than the other, you have not had any experience or not enough actual experience to say?—A. In my judgment an incorporated body has many advantages that an unincorporated body has not. The title to property is more secure.

Q. (By Mr. RATCHFORD.) You were simply speaking from your knowledge of industrial affairs when you stated that the incorporation of trade-unions would be advantageous to the workman as a whole?—A. I was, most assuredly.

Q. The next question is No. 4—relations to nonunion labor and the right of liberty of contract.—A. Now, the relation of nonunion labor to union labor is certainly disadvantageous to the latter. At the present-time and under existing conditions it don't appear to me that, in the broadest sense, there is any such thing as real liberty of contract. The necessity of the individual compels him to accept such terms as the employer may see fit to impose upon him. And while, in a narrower sense, he is at liberty to refuse to accept these terms, nevertheless his necessities compel him to accept them; therefore he has but little real liberty of contract.

Q. (By Representative BELL.) Is it your idea that the organized portion of labor prevents the unorganized from attempting to contract or from consummating a contract?—A. In all candor I am compelled to say that in many instances it does.

Q. Organized labor limits the power of unorganized labor to contract; that is what you mean?—A. It certainly does under some circumstances. Sometimes organized labor undoubtedly attempts to bring all unorganized labor into the ranks of organized labor, and it desires unquestionably to make the conditions under which unorganized men work so undesirable that it will not be deemed advisable by them to remain in an unorganized condition.

Q. (By Mr. RATCHFORD.) Is it the custom to accept into these unions men who are known to be lawless, or do they seek to elect men of good moral character?—A. Every man is supposed to be a man of good moral character and supposed to be temperate and not addicted to lawlessness and not given to trespassing upon the rights of others. In fact, its membership is supposed to be made up of good citizens, those who are law abiding and law respecting; and those who have the reputation in the community of being given to drunkenness and insobriety and a lack of proper respect and appreciation of the rights of others are debarred from membership. While I don't mean to say that rule is always invariably followed, it is supposed to be.

Q. (By Representative BELL.) It is the general doctrine?—A. Yes; but I don't mean to say that some of this class do not find admission.

Q. You stated previously that, taking the State as a whole, about 25 per cent of the workmen belonged to the unions?—A. That is, approximately. It may be more or less.

Q. In case of these unions being engaged in a strike, where they have about 25 or 30 per cent organized, to what extent does the strike affect the nonunion labor, and to what extent does the union try to govern prices?—A. It usually controls them with a fair degree of resoluteness, owing to the fact that the union has a certain amount of cohesiveness of action which enables it to act unitedly, whereas those upon the outside do not have such a unity of action, and therefore the men who are organized usually determine the policy of those who are not. And those who are on the outside, to a very large extent, are in sympathy with those who are organized; and usually where the strikes occur they occur in localities where a very large proportion of the men are organized.

Q. (By Mr. RATCHFORD.) Take up the next question, No. 5; unskilled labor.—A. Unskilled labor, as a rule, is not so well organized as skilled labor is; a large part of the labor of Colorado that is unorganized consists of unskilled labor. Efforts in the direction of organizing unskilled labor have not met with nearly such great success as the same amount of effort to organize skilled workmen.

Q. How do you account for that?—A. As a rule the standard of intelligence is not as high among the unskilled workmen—among the clodhoppers, I mean, using that word in no disrespectful sense—and therefore do not appreciate the advantages of organization.

Q. Organization and intelligence go hand in hand; is that it?—A. I think so. There is no other way of stating it, perhaps.

Q. We will turn next to the topics of strikes, arbitration, and contract labor.—A. It seems to me that the fundamental cause leading to all strikes is this: That all labor is expended either upon land, directly or indirectly, or upon materials drawn from the land in process of manufacture of the different commodities, and one class of people being enabled to control land and machinery thereby governs or compels, more correctly speaking, another class to become its employees; and the class that controls land and machinery, having an advantage over the class thereby obliged to become its employees, is enabled to give a disproportionate share of the product of labor to the employee, consequently compelling or inducing the employee to all the time be asking for a larger and larger share of the product of his labor; and this being met by a corresponding indisposition upon the part of the employer to give more, the law of supply and demand leads to and is constantly producing a friction between the two classes.

Q. You think the underlying cause of all strikes is the desire on the part of labor to increase wages and the desire of the employer to keep them down?—A. Yes; the desire upon the part of labor to get a larger proportion of the product of his industry and the desire upon the part of capital to give him a smaller proportion of it.

Q. What have you to say as to the economic results of strikes and lockouts to the workers and employers?—A. The economic result of strikes and lockouts to employer and employee and to society at large is to bring more and more strikingly to the attention of all classes the fact that our present social organism is based upon a fundamental injustice, namely, private ownership of land, the control of natural prices; and the economic result from it is to impress the public mind with the necessity of removing the causes of strikes and lockouts by increasing the price of the employee in a manner that will enable him, through the possibility of becoming his own employer, to bring his wages up to pretty nearly, if not quite, the actual value of the product of his industry. Therefore the economic effect of strikes upon society at large is unquestionably good, notwithstanding the fact that for the time being they seem to work great hardship. In short, while strikes are wrong, they are the inevitable result of wrongs which go before them. While fundamentally wrong, the rule is that it is the result of a whole multitude of wrongs that went before it; and if the one did not exist neither would the other.

Q. Before we pass the question of strikes I should like to have you explain a little more fully the economic result of them.—A. It is invariably taken by the communities as a whole, I believe, that if there be friction between the employer and the employee resulting in a strike, and they have a fight to increase the wages, and the employer resists it and the strike is lost to the workmen, the loss to the workmen is figured upon a basis of their daily wages multiplied by the number of days idle. That shows the net loss to the workmen.

Q. Do you believe or not that strikes that are lost to them are an actual loss to the laboring men?—A. No; because society as a whole receives a certain amount

of education with reference to the cause of strikes that ultimately compensates to a very great extent, for the immediate loss for the time being to the employees. That is the reason why it is not a loss in the manner in which it is generally computed.

Q. Yet there is not any rule by which the advantages gained can be measured, except to view it from a particular standpoint?—A. In a general way that is right. There is no manner in which you can compute it except for the time lost and the amount in dollars and cents, but there is an education in economics along these lines that runs through and permeates our social system that is productive of good itself; and, in the second place, there is another advantage that comes from it—it would have an effect that might prevent that difficulty in the future, and if wages become advanced at any time after that, or if there was a probability or possibility of wages being decreased, the employer, recognizing the disastrous effect of a strike, would hesitate seriously before he would precipitate another.

Q. Do you know of any other influence that tends to improve the surroundings of the workmen, shorten the hours of labor, make the condition of labor as congenial as possible, and increase his wages, that operates so favorably in these strikes as the ability of the workman to strike on the one hand and the fear of the strike by the employer?—A. Yes; I think I do. The intelligent use of the elective franchise—the intelligent use of the ballot, it seems to me, is the most important remedy of all to bring about these results, and to bring about a higher civilization.

Q. I am not speaking about the higher civilization so much as I am speaking about the wages and good conditions of employment.—A. Yes; with reference to that, I believe the intelligent use of the ballot will bring around the best results.

Q. Methods of strikes—take up that topic; the manner in which strikes are brought about and conducted, together with the first stages. Do the officers of these unions arbitrarily declare a strike, or do the men themselves, through their representatives, or otherwise?—A. As a rule the grievance or complaint is brought before the organization and discussed; a committee is usually appointed for the purpose of bringing it to the attention of the party complained against. The committee performs its duty and makes its report; the report is discussed pro and con exhaustively, and sometimes the committee is discharged and another committee appointed to see if it can do better, make better terms, or make more satisfactory arrangements, and that committee reports, and usually some considerable time is spent between the time that the complaint is first made and the grievance is first considered and the time that the final determination is arrived at. After the matter has been discussed pro and con and several committees have gone backward and forward and reported the matter, it is finally submitted to a vote of the union or organization and a majority vote determines what the action shall be.

Q. While these negotiations are going on, are the workingmen idle or at work?—A. The work is always in operation during this period, so far as my experience or knowledge goes.

Q. If a strike is declared, by what methods is it conducted?—A. Well, the men are usually cautioned very carefully to abstain from the commission of any act of violence or of any act that will interfere with the rights of anyone else, or with anyone else who thinks best to enter into the employ of the corporation against whom the strike is directed. And there are usually, or at least sometimes, arrangements made for certain weekly benefits to the families of those who are thrown out of work by reason of the strike, and other committees are outstanding for the purpose of trying to persuade any person who sees fit to enter the employ of the corporation against whom the strike is directed, from doing so. But they are always cautioned very carefully to abstain from the commission of any overt act in inducing the person to quit work. And generally, or at least sometimes, committees are appointed for the purpose of waiting upon the strangers coming to town, to explain the situation to them and try and prevent them from working, and looking out for their immediate necessities, providing they are in want.

Q. To prevent them from taking the places?—A. Yes, sir.

Q. Is boycotting frequently the result on the part of the laborers?—A. There was a law enacted in this State several years ago making it a criminal offense; at the same time the black-list law was enacted. It was formerly repealed to a certain extent, and is illegal at the present time.

Q. What methods are usually employed, in case of a strike, by both sides tending to influence favorable results?—A. Well, the employees endeavor in every legal and legitimate way possible to bring production to as absolutely a standstill as possible, and the employers sometimes simply allow production to remain at a standstill until such time as the necessities of the employees will compel them to return to their employment; and upon other occasions they resort to the expedient of importing laborers for the purpose of taking the places of the strikers.

Q. Do the employees sometimes apply to their fellows in other States and other cities to aid them in the strike?—A. Yes; they invariably notify the unions.

Q. Do the employers at any time avail themselves of a common fund for the purpose of gaining the point in issue?—A. I have no positive knowledge upon that point, but I have understood that they do.

Q. Sometimes import labor?—A. Yes; they import labor. But with reference to the common fund I have no positive knowledge. I have understood that such was the case many times, but I have no direct knowledge on that point.

Q. Can you point out any instance when such outside labor has been imported?—A. Yes.

Q. Under contract?—A. Well, it was undoubtedly under contract in the Leadville trouble. Agents were sent back to Missouri and other places for the purpose of hiring employees. At least one man told me personally he went back there for that purpose.

Q. Have you any State laws forbidding it?—A. I am not quite certain upon that point. I don't think we have.

Q. What is your judgment as to the wisdom of enacting such a law?—A. Under existing conditions I would think it desirable.

Q. Do you or not believe that labor imported into your State under the conditions named resulted in any advantage to the State?—A. Judging from the character of the employees that came to the Leadville district under contract—I think they came there under contract—I would certainly think it was very disadvantageous to the people of the State, for the employees who came to the Leadville district from the outside were the worst lot of all-around thugs that ever came in a body to the State of Colorado. They came from Missouri and came there in bodies.

Q. Were they of a criminal class?—A. In my judgment, they were.

Q. At least they indicated that?—A. Yes; and their conduct around town after they came there indicated that. There was scarcely ever a time in late years when there was so much criminality in the Leadville district as in the few months following the importation of what were called the "scabs" from Missouri, and the business of the police court was very largely made up of this class of people.

Q. Did they receive protection from the State?—A. Yes; they did from the militia. There was a home militia company organized for the purpose of protecting them. They would have undoubtedly come under the operation of a law forbidding such importation.

Q. And would not have had the military forces of the State to protect them?—A. Most assuredly not.

Q. Yet coming from Missouri, the effects of the lawlessness were the same as if they had been imported from another country?—A. Absolutely the same so far as the effects were concerned.

Q. Yet the law takes a decidedly opposite position in both cases?—A. Yes.

Q. What have you to say as to conciliation, mediation, and arbitration under state law, by joint committees, temporary or permanent?—A. Strikes, as a matter of fact, are industrial warfare. It is industrial war, and, like any other kind of war, it means the destruction or at least cessation in the production of wealth. When two individuals are unable to agree with reference to their rights they are compelled to take the matter into the courts, and they are compelled to abide by the decision determined upon. Now I see no reason why an employer or employee, both having engaged in something that interests the entire State, ought not to be compelled to submit their differences to an impartially constituted tribunal, and abide by the decision determined upon; therefore I believe in compulsory arbitration under conditions that will compel both parties to abide by the determination arrived at by the properly constituted tribunal or authority.

Q. Will you please state why you believe in compulsory arbitration?—A. The people of the entire State, aside from those directly interested, are affected by a warfare of this character. Therefore they have a right to compel both sides of the controversy to submit it to a tribunal, and to be governed by the result. There is no person who is privileged to do exactly as he wishes. We all have to be mindful of the welfare of society. When each party to a controversy of that character is compelled to submit his differences to this tribunal he is only placed on a parity with two individuals who fail to agree with reference to their rights, when they are compelled to submit their differences to a legally constituted tribunal.

Q. If such a law is on the statutes of your State, a law providing for the compulsory arbitration of every labor dispute and making it obligatory upon each party to accept the result of any award that might be handed down by such authority, would it or would it not give rise to unjust claims and demands from both or by both sides?—A. It might at the beginning; but it is to be sup-

posed that a tribunal constituted in that manner would also be empowered to determine whether the differences were great enough to warrant the State board of arbitration in undertaking to arrange their adjustment.

Q. Whether it was a proper subject for that tribunal or not?—A. And if a large number of frivolous pretenses of that kind were submitted to the State board of arbitration and they turned them down, it would not be but a short time when those differences only that were meritorious and were really worth consideration would be presented for adjustment.

Q. In the last analysis, would it or not, in your judgment, mean the settlement of wages by law?—A. It would.

Q. That is what it would mean?—A. Yes.

Q. From your large experience in trade unions, are you of the opinion that such compulsory arbitration law would be acceptable to the trade unions of your State?—A. I believe that it would.

Q. What have you to say of the injunction in strikes?—A. Under existing conditions it seems to me a very arbitrary stretch of judicial authority.

Q. Are these injunctions frequently resorted to?—A. They sometimes are.

Q. With what effect?—A. Usually with the effect of preventing labor from the exercise of certain rights which it is supposed to possess under the common law, and usually in a manner that is prejudicial to the interests of those who are engaged in the strike, or the strikers.

Q. Do the strikers usually observe the restraining order?—A. Well, I think that they do to a very great extent.

Q. Where it is violated are they punished for it?—A. They undoubtedly are.

Q. Committed to jail?—A. Yes; frequently. There are frequent instances of that, and I don't have to go very far to find one.

Q. I would like to have you enumerate as many as you can and state the punishment inflicted.—A. One of the most flagrant cases of that kind was during the great strike in California several years ago.

Q. We are speaking of your own State. If you wish in a general way to speak about the injunction we would like to have your testimony, but on this point we are speaking of your own State.—A. Well, I have no exact data with reference to the exercise of that power in this State. It was not used in the Leadville district during the great strike there, and I do not know of its exercise. I remember something about its being exercised here in Denver some years ago, and therefore I will not speak positively with reference to it. I have no distinct knowledge of its being used or exercised in this State of late years.

Q. But you can speak of the general principle of it and the effect of it?—A. But in California during the great railroad strike and during the A. R. U. strike there were several men arrested and imprisoned, and their sole offense was violating the injunction of the courts. I have their names at the office, but I have not them here. There were 5, I think.

Q. Were there any other crimes charged to them under which they were convicted?—A. No other crime charged to them under which they were convicted.

Q. We will pass to the next question—wages and methods of payment, weekly and biweekly payment.—A. Biweekly payment, it seems to me more particularly, is the most advantageous manner in which workmen can receive compensation for their labor. Weekly or biweekly payment gives them the advantage of being able to purchase more economically than they otherwise could, and prevents the growth of the credit system, which to a very great extent compels people to pay higher prices for that which they procure and to pay for things they do not get at all.

Q. You believe the semimonthly or weekly payment would be beneficial to the working classes?—A. I do, most assuredly.

Q. Payments in cash?—A. Yes.

Q. As to the method of working the mines of your State, do they usually pay for the time worked?—A. Oftentimes that is the case.

Q. Piecework?—A. Yes. Oftentimes tunnels and drifts are driven by the foot, and sinking is frequently done by the foot.

Q. You refer to miners in the ore mines?—A. Yes. Frequently they are paid by day's pay.

Q. What wages?—A. Two dollars and fifty cents and \$3 per day. Sinking and drifting are frequently done at so much per foot, under contract.

Q. Is overtime work paid for where it is performed?—A. It always has been. Of course, there is a law in this State now forbidding it.

Q. What have you to say as to the sliding wage scale?—A. The sliding wage scale, under existing conditions, would seem to me to be eminently fair, because the compensation for labor is paid out of the product; is not paid by any pre-existing fund, but paid out of the product of the labor, and as the price of a

commodity that is represented by a given amount of labor rises it would seem eminently fair that the wages for the labor engaged in this production should rise correspondingly, and when, under certain conditions the price of a commodity depreciates, it is, perhaps, eminently fair that the wages should be diminished correspondingly.

Q. Have you any mining industries in your State where the men are paid on the sliding-scale system?—A. I do not know of any.

Q. Or any other industry?—A. I don't know of any.

Q. As to the minimum wages, what is your opinion on that subject?—A. It is the lowest wage upon which the individual can possibly live and produce.

Q. Do you believe a line should be drawn?—A. No, you can not draw a line; and existing conditions seem to have the effect of pushing the price of labor to the lowest point upon which the individual can live and produce.

Q. You probably do not understand my question. The minimum wage scale undoubtedly means the lowest rate of wages for which a man can live and support himself and those who are dependent upon him, but there are many cases in which a line is drawn, where it is mutually agreed between the employer and employee that wages for certain labor shall not go below a given point under any condition, presuming of course that it is the minimum wage and it will require that wage for men to live upon.—A. Under those conditions of course I should favor that scale. I don't know of any arrangement of that kind in operation in this State.

Q. As to this question—the living wage, standard of living?—A. The living wage at any time will be represented by what the mass of workingmen are willing to live and produce upon. If there is a standard that requires the payment, for instance, of \$3 per day, people will live in conformity with that standard, and if but \$2, they will have to reduce the comforts of life; they will have to reduce correspondingly; and if but \$1.50, they will have to reduce correspondingly. So that the living wage at any given time is the standard of living in conformity with which the men are willing to live and produce, and of course the higher the wage the higher the standard of living. The standard of living is always in conformity with the wages paid. If they receive higher wages they will read more, clothe themselves better, and educate their children better.

Q. And reach a higher civilization in every respect, and presumably become better citizens?—A. Most assuredly.

Q. What have you to say as to store orders and payment in kind?—A. Store orders, so far as this State is concerned, and I presume this is a fair representative of the other States of the union, have had the effect, so far as I know, by information and belief—I have had no direct intercourse with them, or anything to do directly with payments of that kind—have had the effect of compelling the employees to pay a good deal more for their necessities than they would be compelled to pay for the same things in another place, and have also had the effect of compelling the employees to spend the entire proceeds of their labor at the store owned by the company; and the universal consensus of opinion among those who have had experience with store orders has invariably been that the practice has had the effect of robbing them—not using that term in any disrespectful sense—or despoiling them of a certain amount of their wages.

Q. You speak of compulsion in that connection?—A. It really is compulsion to them.

Q. Are they compelled to deal in company stores because there are no others in that vicinity?—A. No; there is no order issued to them, I take it. With a good many of them there is no order absolutely compelling them to deal there, but they say they will be put in places where they can make no wages if they do not deal there.

Q. (By Representative BELL.) Won't they ultimately be dropped?—A. Yes; ultimately be dropped, perhaps, or not get but a few days' work per month, and they find it necessary to deal at the store in order to be given desirable places in the mines where they can make good wages.

Q. It is claimed by some that the operation of the stores connected with the mines often brings about this result: that an employer will employ men often beyond the number required for the mining of his product, in order to sell an increased amount of merchandise from his store; or that he would rather, to put it plainly, employ 100 men at 3 days per week or 4 days per week than employ 50 men at 5 or 6 days per week.—A. I have heard the statement frequently made that such was the case, particularly in the coal mines of Colorado, in order that the employees might take up the entire amount of their wages in the store orders. I have never worked around coal mines, but I have heard that statement made substantially as you make it by those who have worked there.

Q. Did those statements come to you from reliable parties? Do you believe them?—A. I am inclined to think it is so.

Q. Another phase of it. It is taken, of course, for granted that the employer who runs a store in connection with his works and makes large profits from that store has a decided advantage over his neighbor employer, that he can undersell him and close him out of business. Have you found that to be the case?—A. I think it is undoubtedly true, because he really gets his coal mined for a smaller consideration.

Q. Now, as to mining tenements; are these tenement houses good tenement houses usually—owned by the coal companies or the mining companies?—A. Usually in the coal-mining camps they are very poor, and they usually rent them for from \$4 to \$6 per month. They are very poor houses, especially through the Lafayette district and Louisville district, and down through the Rockvale district. From \$4 to \$6, I think, is about what they pay; at least that is what some of them told me. They are not houses really at all; they are cabins.

Q. Coupling these together—the company house and the company store—both in connection with the works, what action is usually taken by the companies when a strike is declared?—A. The company very frequently has to order the tenants to vacate the houses immediately.

Q. Keep the store open for them, do they?—A. Not to extend them credit. No credit is extended any further.

Q. Is it or not, in your opinion, advantageous to the company to have these stores in connection with their works, particularly at a time when a strike is in progress?—A. Well, it most assuredly gives them a great advantage in settling a strike in their favor. It is certainly very much to their advantage.

Q. What have you to say as to fines and penalties?—A. The fines and penalties imposed upon coal miners, you mean, particularly?

Q. Yes.—A. Well, I have been told by coal miners that they are frequently fined when coal is produced under certain given conditions and does not come up to the standard, or when there is a certain amount of rock or waste in it; they are fined to an extent that is disproportionate to the actual loss.

Q. Fined in dollars and cents?—A. Deducted; certain deductions, or docked, as they call it. Of course I never worked in a coal mine; never was in one but once, and have no personal knowledge of them.

Q. Docked in wages?—A. Yes.

Q. What becomes of the material?—A. I have understood it is sold—what is called waste is sold at a reduced price as an inferior class of coal.

Q. The contents of the whole wagon sold at a reduced price, or just the material that is said to be impure?—A. The material that is impure.

Q. The other is sold at the prevailing rate?—A. Yes. The difference arising between the employees and the company over at Baldwin was whether the coal should be handled with shovels or whether it should be forked. Of course if it was forked there would be a large amount of waste that the employees would get paid for if they handled it with a shovel; but as the company claimed what went through the fork was an absolute waste, they declined to allow the employees to use a shovel; claimed that there was a loss of about 7 cents per ton as between forking it and shoveling it. Well, the union came together and offered to make a deduction of 10 cents per ton and retain the privilege of handling it with a shovel, which, of course, was 3 cents more than the company alleged it would lose by having it handled in that manner, but when that proposition was made it was rejected. It would seem to indicate that they didn't want to start up.

Q. The difference in wages in the different States and sections; have you anything to say on that topic?—A. Well, the wages in the mining camps are undoubtedly better than in any other part of the State, and I think the wages paid in Colorado, as a whole, are higher than in the other States of the Union.

Q. Are the wages within your own State, for the same labor, pretty uniform?—A. No; they are not exactly uniform. The wages in the mining industry—coal mining and metalliferous mining—are pretty uniform throughout the State, but many other classes of labor is generally paid some better in the mountain towns than in the valley towns. The price of labor of every description, in fact, is a little higher in Leadville than in Denver.

Q. How do you account for that?—A. The cost of living is higher there than here.

Q. Has the organization of the workmen anything to do with it?—A. Yes; it may have something, because, I think, labor is rather better organized, as a whole, in the mountain districts than in the valley towns.

Q. And to that extent wages are higher?—A. Yes.

Q. Is it not a fact that the nearer you get to the mining camps, where the

wages are the highest in the State, the greater common labor and farm labor and every kind of labor—it all has a higher price?—A. Invariably so; yes.

Q. And the farther you get away from the mining camps, the lower the price of farm labor?—A. Yes.

Q. And that the high wages of the miners influence the wages in all other vocations?—A. Yes; most assuredly.

Q. For instance, you take a railroad camp. Is it not most difficult to keep section men on a section near a mining camp? They are paid \$1.25 per day and you pay \$2 per day in the mining towns for similar labor, for surface work. Are not the section men constantly quitting the railroad and going there in order to get the higher wages? The close proximity of another industry that pays higher wages causes a dropping away from the lower-paid industry and complete depletion of its ranks. Farm labor is about \$20 per month, and the nearer you get to the mining camps—Ouray, Telluride, and any of these points—it is \$25 and \$30, and difficult to get at that.—A. Yes.

Q. They are always looking for employment in the mines?—A. Yes.

Q. The influence of the high wages permeates the other vocations?—A. Yes; it most certainly does.

Q. (By Mr. RATCHFORD.) We will couple the other questions together—21, 22. If you can, go back for a length of time, say 10 or 20 years—so far as you can—and give us the relative rates of wages, and state whether or not the condition of the laborer is improving socially—whether he is getting more intelligent, and living better than he used to do?—A. As to that, I believe that the laborers at the present time—the great mass of the workingmen—are more intelligent than 20 years ago, and I believe that they have a better idea of that which is necessary to be done in order to improve their condition. So far as the standard of living is concerned, and so far as their being able to provide themselves with the necessities and luxuries of life, I do not think it has improved any in the last 20 years. I do not think that the mass of workingmen are better off than 20 years ago. I don't think they enjoy any more of the necessities and luxuries of life, and perhaps in many cases not as much; but that they are more intelligent I think is unquestionable. They are giving closer attention to social and economical conditions than they have at any other time, and there has undoubtedly been a great improvement in workingmen in the last 20 years. There is not so much depravity and drunkenness among the workingmen as 20 years ago.

Q. (By Representative BELL.) Would not the case be much different in Colorado than other places, on account of the newness of the country?—A. Yes. Twenty years ago everything was booming; prices were high and wages high. Everybody was busy when I first struck Colorado.

Q. Greater prices for products?—A. Yes; the newer a country is, invariably the better it is for the masses of the people there.

Q. Wages have not improved, but their social condition has during the past 50 years?—A. I think so; that is to say, they are expending the wages they now receive more judiciously. I also think the general standard of intelligence is better.

Q. (By Mr. RATCHFORD.) The standard of intelligence is due to what? Increased prices or what?—A. It is due to the fact that their necessities force them to study the causes which constantly seem to be depreciating their earning capacity; to make a study of the economic conditions.

Q. The increased facilities of your State, as compared with 20 years ago, have done much to bring about that feeling and result?—A. Yes; undoubtedly it has.

Q. We will take the next question—increase or decrease of number employed. Of course there is a large increase in your State?—A. As between now and 20 years ago, yes. There is a very large increase in the number employed in this State, because there has been a great unfoldment of industry in every respect as compared with 20 years ago. The number of unemployed here is vastly greater in proportion than 20 years ago. In fact, there were no unemployed then. There is now a very large number of unemployed in every camp, hamlet, and town in the State; just at this particular time, I should say there was. And even prior to this recent difficulty, there was a large number of unemployed in all of the mining camps of the State.

Q. Permanently unemployed or temporarily?—A. There probably is but very few of them, if any, that are not employed a part of the time throughout the year, and I believe it to be reasonable to say that the average number of unemployed throughout the State, as a whole, is probably 25 per cent of the number of people, but of course it does not represent the same individuals. I do not mean to say that a certain 25 per cent of the people are not employed at all during the year, but a number of them are employed at one time and a number at another.

Q. That is to say, in effect, all of them are idle one-fourth of the time; is that it?—A. Yes; that is it, approximately.

Q. What do you say as to the employment of children?—A. There is a law in this State which compels the attendance of children upon schools at least fourteen weeks in the year. The effect of the employment of children, no doubt, at the present time, with the advanced use of machinery, is very hurtful. In some cases a boy of 12 or 14 can run a machine just as well as a grown man can, and he throws the man out of employment; and at the same time it prevents the boy from getting the education that should come to him at that age.

Q. You have a law, you say, which will compel the attendance of children at school at least 14 weeks in the year?—A. Yes.

Q. Have you any law limiting the age at which children shall be employed in the mines, factories, or mills of your State?—A. Yes; I think so. I think it is 16 years; maybe it is 14; I am not quite clear on that point.

Q. Causes of irregularity of employment.—A. Well, there are quite a number of causes that could be mentioned in that respect. Of course the particular cause of the irregularity of employment is the fact that the wages they receive do not enable them to buy back more than a small portion of their product; that is, labor being employed for 5 or 6 months in the year will produce enough to supply the market for the entire year, while the compensation they receive will only enable them to purchase back a small part of it. Secondly, there is a large amount of product that there is no market for, because there is no accumulation in the hands of the employees to enable them to purchase it.

Q. Hours of labor—Sunday labor.—A. Sunday labor, in my judgment, is hurtful and bad, for the reason that where workmen make a practice of working 7 days in the week they will get no more compensation for it after a little than they will if they only work 6.

Q. (By Representative BELL.) Don't they break down in a short time?—A. Yes; and they will get no more compensation than if they work only 6. It is hurtful to them so far as their health is concerned. By working every day in the week they break down earlier than they otherwise would.

Q. (By Mr. RATCHFORD.) As to the hours of labor in your State.—A. Well, the hours of labor in the past have always been from 10 to 12. Mining labor has usually been 10 hours, except that in wide shafts and places where the ore is very hard to crush it has sometimes been 8. Labor in the smelters has invariably been 10 and 12 hours.

Q. Has been that in the past?—A. Yes.

Q. What is it at present?—A. Of course the last legislature enacted what is known as the 8-hour law, making a day's labor in the mines and smelters and reduction works and everything of that character 8 hours.

Q. Is it confined to the mines and smelters, or does it include public works generally?—A. There was an old law that has been on the statute books for a number of years that prohibited any contractor upon public works from employing labor for more than 8 hours per day, and compelled the municipalities to work their employees only 8 hours per day; but this new law simply related to the employees of mines, smelters, mills, reduction works, etc.

Q. Is that law generally complied with?—A. It went into effect the 15th of June.

Q. Has it been complied with?—A. I think it has been generally complied with so far as the mines are concerned and the smelters of the State—two that are in operation; the most of them are closed down.

Q. Are they closed down because of the passage of that law, in your opinion?—A. Yes; they undoubtedly are.

Q. The employers are resisting it?—A. They are contesting its constitutionality, and the workmen, of course, are trying to sustain it.

Q. Do you or not believe that the full observance of that law would result in advantage to all?—A. I most assuredly do, because it would give the mass of men more recreation, more time for study, more time to rest, and it would give them a larger number of hours per day free from the deleterious, nauseous, and poisonous gases and foul air that surround them while employed in the mines and smelters.

Q. A decision on that law is expected soon, is it?—A. It is; yes.

Q. Well, without asking you to speculate or give an opinion as to what that decision may be, I should like to ask you, in a general way, whether, in your opinion, the shorter workday will become general—if not by law, by the operation of the unions and by the support of public opinion?—A. The advance of labor-saving machinery, of course, makes it possible to produce a given amount of wealth, and with a much smaller expenditure of labor than formerly. The result of that is

undoubtedly to impress the public mind with the fact that a smaller and still smaller number of hours is necessary in order to give the producing classes a part of the advantage accruing from the advance in such labor-saving devices and methods, and the consensus of public opinion has undoubtedly become more and more favorable to the reduction of hours of labor; and there is no doubt of the fact that whether the decision is favorable or unfavorable there will be gradually a reduction in the hours of labor. But a favorable decision along these lines will hasten it along.

Q. Have you State laws as to screens, company stores, etc.?—A. I don't think we have.

Q. Then we will take up Part V—cooperation.—A. Well, we have had something in the line of copartnership or cooperation here in Colorado. There have been several cooperative stores organized at different times, and one or two cooperative colonies. There is a cooperative colony operating down at Pinon at the present time. It has met with—well, fair success—not perfect success; but the results obtained there are reasonably good. And there is also, or was, a cooperative store at Olathe, in Montrose County. What its present status is or how it is getting along I don't know.

Q. (By Representative BELL.) Are you familiar with the cattle business at all?—A. Well, I don't know that I am.

Q. Are you aware of the fact that practically all of the cattle industry is run under a complete cooperative system?—A. So far as the runs are made, do you mean?

Q. The branding and marketing of cattle.—A. I don't know that I am aware of that.

Q. Take, for instance, a cattle district 100-miles square, and every cowboy in the country will have the brand of every other cattleman in the association. If he finds the cattle of B 100 miles away, he brands B's calves. If A finds one of B's cattle 50 miles from his ranch and is coming back, he drives it back to the ranch; and that practice in all parts of the country is complete. The cattle business is run under a complete system of cooperation so far as branding cattle on the range, gathering, etc., and is probably the most complete cooperation in the West.—A. Yes; I think there is some arrangement of that kind in almost every part of the State; that there is an association and rules along those lines governing it.

Q. While they have no common ownership, they have a cooperative system?—A. Yes.

Q. Is that very beneficial?—A. Yes; I believe there is something of that kind. I never had anything to do very directly in the cattle business; never rode the range or anything of that kind.

Q. (By Mr. RATCHFORD.) As to other plans for improving the condition of workmen, etc.—A. Well, as our society is constituted at the present time it seems to me eminently just and fair and proper that after a man has contributed to production throughout his entire life, and the wealth that his labor has produced is part and parcel of the State, it is proper that he be given back a proportion of it in the shape of an old-age pension when he becomes incapacitated from future production and labor, and therefore I believe most positively in the pensioning of producers who have become incapacitated from further production or labor.

Q. You have no system of that kind in Colorado, have you?—A. No, nor anything which approximates it.

Q. We will take up the question of immigration, on page 6. You can glance over that and treat it in your own way.—A. The effect of immigration under existing conditions is undoubtedly to depreciate the price of labor by making or causing in every part of the country an excess of employees—more employees at any given time than there is employment for. And therefore, under our existing social system, immigration has the effect of diminishing the price of labor. It is undoubtedly hurtful to the great mass of workmen now in the country.

Q. Have you any suggestions to make as to its regulation?—A. Well, I don't care to advance an inferior remedy when a proper remedy can be presented. If 20,000,000 people come into this country to-morrow, and if every person could become a producer, it would undoubtedly add to and enhance the national wealth. At the present time it would undoubtedly be advisable to restrict immigration to those who come into the country bringing a small amount of wealth and being able to read and write the English language.

Q. What do you say of colored labor and non-English-speaking labor?—A. There is none in Colorado to amount to anything.

Q. (By Representative BELL.) Haven't they imported some 2,000 into Pueblo—colored labor?—A. Yes; this was at the Colorado Iron Works. I had forgotten that for the time being. But that is right; it is so. So far as I know, that is the only case where any amount of colored labor exists in this State, or where any man has been brought here for the purpose of taking the place of white labor; and in so far as that has been tried in this State—in that instance it has been hurtful to the white labor of Colorado. But there is quite a non-English-speaking population in Colorado. There are a good many Swedes, but they are not non-English-speaking, exactly; the most of them are now English-speaking.

Q. How about the Italians?—A. They are a class by themselves. As a rule they are very clannish and don't take up with the American customs. They don't learn the language to any extent, but the most of them can talk it a little bit in the Leadville district. I am more acquainted with them there than anywhere else. As a rule they work around the smelters, but they are not a desirable class of citizens.

Q. (By Mr. RATCHFORD.) Do you regard that class of labor as being hurtful to the best interests of your State?—A. It certainly is.

Q. 37, 38, and 40 can be treated collectively, as they all relate to sufficient school facilities.—A. The public-school facilities in most of the towns of Colorado are not only equal to the best, but confer upon the sons and daughters of the workmen that kind of education that will be most conducive to their success in after life. Manual-training schools have been established in but very few places throughout Colorado. There are 1 or 2 in Denver, but I don't know of any others in the State. At the present time it would seem eminently desirable that a system of manual-training schools should be established in connection with the public schools throughout the State, and there would thereby be imparted a knowledge of handicraft that is sadly lacking under our present system of education, and that would enable the pupil upon graduating from the public school to earn a livelihood along lines of action that at the present time they are entirely ignorant with reference to, and therefore manual-training schools are necessarily important, and it would seem to me eminently desirable to bring about the enactment of legislation that would establish one in connection with each public school.

Q. Have you anything to say as to libraries, reading rooms, etc., for the benefit of those who are engaged in manual labor during the day?—A. In every State and city there should be city libraries, free reading rooms, city reading rooms, lyceums, and everything of that kind maintained and supported by the State or city for the purpose of giving education and training to those who are unable to avail themselves of the advantages in these lines.

Q. You have no such schools supported by the State?—A. No.

Q. As to convict labor.—A. That is quite an important item. Convict labor is a subject that has engaged the attention of organized labor in this State ever since I have been in Colorado, and it is a vexed question. It is a little difficult to determine what disposition had best be made of it. But I think the general consensus of opinion in this State is in favor of the employment of convict labor; in favor of the employment of it upon public works—State works, and in a manner that won't permit its product to come into competition with the product of free labor, and that will distribute the product of the handicraft of convict labor throughout the different State institutions; and in work upon such public works as otherwise would not be carried forward at all. And the general sentiment, in my judgment, is absolutely opposed to the contracting or farming out of convict labor in connection with complicated machinery.

Q. What are they employed at now?—A. A part of them are employed upon the State road near Canon City and a part of them employed at various avocations around the penitentiary, in boiler shops, blacksmith shops, and different places for the purpose of manufacturing those articles which will not be sold in the general market at all, but used by the convicts themselves for the purpose of getting stone in the stone quarry, and for the purpose of putting in buildings in connection with the penitentiary. In fact, there is none of the labor used in such a manner as to compete with the employment of other labor.

Q. Not leased?—A. No.

Q. None of them employed in the mines?—A. Not one.

Q. Have you any further suggestions for the improvement of this system?—A. I don't know that I have. We have a law in this State upon that subject that makes it pretty fair. It makes it necessary for the warden to employ the convicts in such a manner as not to compete with other labor.

Q. You believe that is a very satisfactory solution of it?—A. I do.

Q. (By Representative BELL.) For instance, if there was a possibility of building a State irrigation canal, but capital would not go into it because of the small

possibility of profit, and such a canal would enable numerous persons to build homes and irrigate lands, would you call that a fit object upon which to employ convict labor?—A. Yes; and even if it was a vocation that capital would engage in, if the State could employ that labor profitably in a manner that would be conducive to the interests of the people of the whole State, the employment of convict labor along those lines would be in keeping with my views upon that subject. But I should certainly be opposed to the contracting of or farming out of that labor in any manner that would enable its products to come into competition with the product of honest labor.

(After a recess the examination of Mr. Smith was resumed as follows:)

Q. (By Mr. KENNEDY.) Have you ever heard of nonunion men having such fear of union men that they would not freely express opinions to nonunion employers?—A. No; I think not.

Q. Do you believe that the nonunion men of Colorado are terrorized by a fear of the union men?—A. I don't think so. I think they would express themselves freely to nonunion employers. All the employers are nonunion, in fact.

Q. Does or does not the union have the effect of holding up the wages of that labor which bears none of the burdens and responsibility of organization?—A. It certainly does help to stimulate the price of all labor.

Q. You, think, then nonunion men profit by labor organization, though taking no part in it?—A. They most assuredly do.

Q. Have you anything to say with regard to that?—A. All that I have to say in regard to that is this, that it is rather contemptible upon the part of employees to refuse to participate in the organization while at the same time deriving a certain amount of benefit from the organization.

Q. You spoke this morning of unskilled labor. I should like to ask you if there is, properly speaking, any such thing as unskilled labor.—A. What I understood, when I spoke of unskilled labor, was that character of labor that does not require experience in order to perform it with a degree of efficiency that will enable it to give the satisfaction desired by the employer; for instance, pushing a wheelbarrow.

Q. Is not a certain degree of skill required in the commonest kind of labor to render satisfaction?—A. Not in the sense in which the terms skilled and unskilled are used. It requires a certain amount of strength to push a wheelbarrow, and it requires a certain amount of skill to manage a furnace so that it will not burn out.

Q. Is the distinction between skilled and unskilled labor determined by the fact that it is necessary to learn a trade or not learn a trade?—A. Not necessarily to learn a trade; but skilled laborers are those who have had a sufficient experience in the character of work in order to do it efficiently.

Q. After laborers have been working on the street for a time, would you call that skilled labor? What is your opinion on such work as that?—A. Yes; it would undoubtedly require a certain amount of experience to perform the work to a better advantage than a new beginner.

Q. You stated this morning that you favored a system of compulsory arbitration which would practically have the effect of fixing wages by law?—A. Yes.

Q. Do you believe that the organized workers of Colorado are in favor of such a system as that?—A. In my judgment they are; that is, en masse—as a whole.

Q. You did say this morning that you believed your wage in Colorado was a little higher than in the other States of the Union, but you did not specify. Could you say something about wages in the mines of Colorado, as to what they are?—A. Yes; the wages here run from \$2.50 to \$3, and in some cases, where the men work under particularly disagreeable conditions, they receive \$3.50. You might say from \$2.50 to \$3.50, although there is a comparatively small portion of the employees that get \$3.50, except in the wet mines and places of that kind.

Q. What do you mean by wet mines?—A. Water dripping down on them.

Q. Does that mean coal mines?—A. I don't know. I am speaking of metalliferous mines. The coal miners usually work by the ton.

Q. Do you know anything about their earnings?—A. I have heard various statements in reference to them; but have no direct knowledge of them. I might have knowledge based upon what some of them told me, if that is permissible.

Q. (By Mr. RATCHFORD.) As to the official reports of the State; as to your knowledge derived from the reports?—A. I don't know about that. I talked with some of them as to the rate of wages. I don't think the rate of wages is included in the report of the mining inspector. At all events, several of them told me that during the last 6 months, since January, that they were only able to work 5, 6, or 7 days in the month, and that their wages some months had been down as low as \$20; and one man told me that for several months he had had only 5 or 6 days' work per month; he told me that when they worked steadily sometimes they made as high as \$80 or \$90 per month.

Q. (By Mr. KENNEDY.) Speaking about the 8-hour law; is that law modeled after the Utah law, that has been declared constitutional?—A. It is an absolute copy of it.

Q. I should like to ask you if you believe the organized labor of Colorado is in favor of further restriction of immigration?—A. I am inclined to think that it is.

Q. And if the commission made a recommendation looking toward further restriction of immigration it would be apt to have the moral support of Colorado?—A. I think so.

Q. (By Mr. RATCHFORD.) Take up the second part on page 7, with reference to the comparative earnings of investments in mining as compared with banking, real estate, railroads, etc.—A. Well, so far as I know, I have reason to believe the profits accruing from investment in mining will compare very favorably with investments in other lines of industry. In fact, I am inclined to think that as a whole the profits accruing to those having investments in mining are greater than those having investments in the other industries mentioned.

I know of no restrictive legislation on the capital employed in mining that has been enacted in these Western States, Colorado in particular, that has done the industry any injustice or that has prevented it from its legitimate and just returns. All of the laws in the State of Colorado, so far as I know or believe, that have been enacted in reference to mining, in reference to securing better sanitary conditions around the mines, etc., have been brought about for the sole purpose of protecting the health of the employees and for the purpose of preventing accidents and for the purpose of making the conditions generally for both employer and employee better than they would be in the absence of such legislation or in the absence of such restrictions.

Q. Taxation.—A. The taxation upon mining property in this State is upon the net output and upon nothing else.

Q. There is no taxation for buildings, improvements, etc.?—A. Not so far as the net output is concerned. There is a tax upon the buildings and machinery, but so far as the mine itself is concerned there is no taxation upon anything except the output.

Q. (By Representative BELL.) Is it not a fact that the mine is taxed for the Government price—not taking the value of the mine but the value of the land at about the Government price—about \$1.25 per acre?—A. I do not know as to that.

Q. There is a nominal tax upon the ground.—A. Perhaps there is, but I don't know for certain. But the mine itself is taxed in so far as the product is concerned.

Q. That is, the value of it beyond the Government price paid to the land board?—A. Yes; the value of the output. As to any suggestions I would make for the modification of the tax methods, State and local, it would seem to me a proper thing to impose taxes upon mines proportionate to the royalty obtained from the mine under lease; in other words, something like the amount over and above the cost of operation and over and above the return upon the investment in the mine would be the amount that ought to accrue to the State. That is taxation along the lines of the single tax, in fact, the proportion to the State of the unearned increment.

Q. How would that operate in cases where there has never been a royalty; where it has been a failure?—A. There would be no tax.

Q. And nothing to pay for bearing the burdens?—A. Well, if it became productive there would be a certain allowance made for the expenses incurred prior to that time.

Q. But if it never became productive?—A. Well, if it never became productive then of course there would be no tax.

Q. And any one who put their money into it should stand the loss?—A. Well, the taxation along those lines would never come up to the unearned increment, and under the existing conditions the losses are usually sustained by the lessees anyway.

Q. (By Mr. RATCHFORD.) If a company should invest their money in a plant in which mineral would not be developed in paying quantities they would lose the money that they put into it; they would have to bear this loss themselves, would they not?—A. They would.

Q. Take up 49; discriminations in freight rates.—A. There has been here in this State a great deal of discrimination in freight rates, and the effect which it has had upon the earning capacity of labor has unquestionably been hurtful, inasmuch as it is discrimination against certain towns and against certain industries and in favor of others. The general effect of it has been to give some advantage to some and place others to a corresponding disadvantage as compared with this discrimination; the effect has been very disastrous upon many of the industries such as have been especially discriminated against.

Q. Would you care to point out any instances in which discrimination has been practiced as between individual producers themselves by the railroads?—A. Yes, that has come to my knowledge by information; not by absolute knowledge, because I never looked it up. Several dealers in Leadville informed me personally that goods have been shipped from California to Denver at a lower price than to Leadville. One dealer told me carload lots were shipped to Denver at \$14 per car less than to Leadville.

Q. While Leadville is the shortest haul?—A. Yes, by considerable.

Q. Have you ever known of discriminations as between producers of minerals on the part of transportation companies?—A. Yes; I have heard it frequently along these lines. I have heard from dealers in the Leadville district that they were discriminated against as compared with shipments from Montana and Utah and other points; that they were charged more for shipping a short distance than the others would pay for shipping distances several times as great. I have heard frequent complaints along those lines.

Q. Have you any knowledge of special rates being given to producers within the same distance and to the same market points?—A. I have no positive knowledge, but I have frequently heard the statement made.

Q. (By Mr. KENNEDY.) Have you heard that the smelter trust enjoys any advantages over the independent smelters in that respect?—A. I have heard that statement made frequently.

Q. (By Mr. RATCHFORD.) The closing of mines; No. 5.—A. The closing of mines is frequently induced by different causes. In 1893, when the great slump in silver came, almost every mine in the entire State was closed for the time being, and some of them never opened; but at the present time, with the increased facilities for production and various other causes, most of them have gotten upon the list of producers again. Of course mines are sometimes closed because there is the hope in the minds of the owners that after a time the product will be more valuable than at the present time, and also upon the ground of labor troubles.

Q. Have you any large combinations of capital engaged in mining coal or ore in your State?—A. Yes; the Colorado Fuel and Iron Company.

Q. Are any of these smaller affairs closed down by reason of forced competition with this combination?—A. I think there is no doubt but what it is deemed advantageous by such combination or trust, or by whatever name it may be designated, to close certain mines at certain times on account of the inability to market the product, or because it is more advantageous to work some other mine in the same consolidation at that particular time. I think there is no doubt but what coal mines are frequently closed down for a short time upon that account.

Q. You are speaking of the mines owned by the trust or corporation?—A. Yes.

Q. How about the mines owned by individuals outside of the combination; do they find themselves unable to operate their plants because of the existence of this combination?—A. They undoubtedly do at times find themselves unable to operate their plants on account of the superior advantages obtained by those on the inside, getting better freight rates, and also through the operations of company stores, which enable them to mine their product more cheaply.

Q. The next topic is 51; concentration and consolidation.—A. Of course the tendency of the industrial conditions at the present time is in the direction of concentration, because it enables the proprietors to control the price of the product and to cheapen its production; in other words, to increase the profits of the investor at both ends by advancing the price and cheapening the cost of production. This has the general effect upon wages and employment of decreasing the price of wages, and tends to make the conditions under which employees obtain employment more difficult; and so far as smaller enterprises are concerned, it has a tendency to eliminate them; in fact, its purpose is to destroy competition and eliminate the earnings of smaller enterprises from competition. The effect of concentration on production is undoubtedly to have such a complete control over production as to enable the promoters to only produce that which they can profitably find a market for.

Q. Take up 52; the legal regulation of trusts, etc.—A. It would seem to me that it is undoubtedly within the province of the State to control trusts and control any and all forms of monopoly as soon as it becomes evident that they are destructive of the best interests of the people of the State, and if it be the consensus of opinion that trusts are destructive to the public interests, such rigid anti-trust laws as would best prevent the growth of these corporations should be enacted at the earliest possible moment.

The inducement to invest is undoubtedly the increased profits and to secure absolute control of production, and the result I think is to crush out competition and to adopt such rules and regulations and methods as will most effectively enable the promoters to enhance their profits. While I don't know anything about

their internal regulations, I suppose they are of such a character as to enable their officers to enforce the rules and regulations they may see fit to adopt.

Q. Take up 54; present labor-saving machinery.—A. The effect of the advance of labor-saving machinery ought to be to decrease the hours of labor and to decrease the prices of commodities.

Q. What effect would it have on wages to decrease the hours of labor?—A. Increase the price of labor.

Q. Have you anything further to say on machinery?—A. The real effect of machinery, however, is to throw employees out of employment and force them into the market in competition with their fellow-workmen to obtain employment and to destroy the handicraft and the mechanical skill that characterizes the individual and make the individual much more dependent upon others and upon the existing social system than he was prior to the introduction of machinery to the important place it has taken in modern production.

Q. Is it your opinion, then, that machinery displaces labor?—A. It most certainly displaces labor.

Q. Temporarily or permanently?—A. It does it temporarily, and in most cases permanently, and makes the employee more dependent than he was prior to its introduction.

Q. Turn to the last part, with reference to remedial legislation, and glance over that. We should like to have your opinion on remedial legislation.—A. Well, I am of the opinion that there ought to be a very rigid employers' liability law enacted in this State.

Q. Have you any such law now on the subject?—A. We have, but it is very ineffective. We have an employers' liability law, but it does not make the employer liable for an injury incurred through the negligence of a coemployee.

Q. What have you to say as to sanitary and personal-safety laws?—A. As to sanitary and personal safety laws, I think around the most of the mines they are very good, so far as I know. And the mine-inspection laws provide many safeguards for the protection of the employees. I am not conversant with the checkweighman laws around coal mines.

Q. As to the laws regulating the employment of children.—A. I think the law upon that subject is quite stringent, and I do not know as any new legislation would be necessary. The school law in this State is compulsory for at least 14 weeks in the year, although I don't know of any officer who is intrusted with its enforcement; I don't think there is any, consequently it is not enforced as well as it should be. A law was passed by the last legislature known as the antiscrip law, which means to prevent companies from payment of any part of their obligations in scrip, and compels payment in legal tender. The laws in reference to arbitration in this State are very ineffective. They almost might as well not exist at all, except in so far as the action of the board of arbitration influences public sentiment. In my opinion there ought to be a rigid compulsory arbitration law enacted, authorizing the State board of arbitration to take cognizance of all difficulties arising between employer and employee where 10 or more men are affected, with or without the concurrence of both sides of the controversy; take all the evidence and get all the facts that will enable them to arrive at a determination, and to enforce the conclusion arrived at.

Q. If that would operate well in your State there is no reason why it should not operate well in every other State?—A. I don't see as there is.

Q. That being true, you think the adoption of that policy in each of the States would virtually be a solution of the labor difficulty; it would settle the labor question?—A. Yes.

Q. You have already stated, or admitted rather, that differences between employer and employee fixed in that manner would be tantamount to fixing wages by law?—A. Yes.

Q. And you express the belief that the organized workingmen in your State would approve of it?—A. That is my opinion.

Q. Sixty-eight; convict-labor law.—A. The law of the State of Colorado is very satisfactory upon the point of convict labor.

Q. Sixty-nine; uniformity of mining legislation, etc.—A. I think it would be advisable to secure uniformity of mining legislation in the several States, so far as it can be done.

Q. Seventy; suggestions for remedial legislation.—A. I think the compulsory arbitration law that we have just referred to would go farther than all other remedies that could be suggested combined; because it will place disputes of that character really upon a par with any and every character of disputes between individuals who go to make up society. It will prevent them from fighting it out and compel them to submit it to a fairly constituted tribunal.

Q. (By Mr. KENNEDY.) You stated that you had employers' liability laws, but that they were not effective because they did not make the proprietors liable for the negligence of fellow-servants. It seems to me, then, that you have no laws in this State—that you have no statute law.—A. Yes, we have a law of that kind. I was looking the matter up 2 or 3 weeks ago. We have an employers' liability law, but it does not have any effect upon the negligence of a fellow-servant. The individual becomes responsible when he enters the employ of the company. I know there have been several measures introduced for the purpose of making the employer responsible, but they have not succeeded.

Q. Then there is no improvement over the common-law practice in regard to that?—A. There may be one or two other points which I have not enumerated. At all events it does not do that.

Q. Has the organized labor of Colorado attempted to secure legislation making the proprietors liable for the negligence of fellow-servants in case of accident?—A. There have been measures introduced in the legislature two or three times, but without any effect.

Q. You have not been influential enough to secure a law of that kind?—A. It might have been done last winter, but there were so many other things that it did not get through.

Q. (By Mr. RATCHFORD.) Under that law, does it not practically exempt the employer from liabilities in all cases where two or more persons are employed or working together?—A. I think so.

Q. As against the negligence of each other?—A. I think so.

Q. And is it possible for accidents to occur in a mine in any other way?—A. There might be cavings in a mine or something of that kind, not directly traceable to any negligence of any employee.

Q. (By Representative BELL.) How would it be about defective machinery put in by the owner?—A. That could hardly be called negligence on the part of the employee, particularly if the employee might have—as I have heard of instances—called attention of the management to the fact that the machinery was defective.

Q. (By Mr. RATCHFORD.) Do you believe such laws are just and equitable to all parties; I mean such laws as you have referred to, that would make the employer responsible to the employee?—A. They hold that the fellow-servant is responsible instead of the employer in the case of an accident. I think it is the height of injustice. I don't think that he should be held responsible. I think the employer should be held responsible for an accident occurring to one employee through the negligence of another employee.

Q. That part is understood, but as it is at present if the employer is to be exempt from damages and the responsibility shall be transferred to the fellow-servant, do you believe that the man who loses his life or is injured because of the supposed negligence of the fellow-servant should be consulted before the fellow-servant is placed at work with him?—A. Yes; he most assuredly should be if he has to be held responsible for it.

Q. As it stands at present, it simply means that a man shall perform his work with anyone that the company sees fit to send with him?—A. Yes.

Q. Whether he is a practical man or not?—A. Yes; he has no choice in the matter, except as he quits.

Q. He has no choice in the matter, and there is no one responsible for it except the party sent to work with him and upon whose action his life depends?—A. Yes, that is it.

DENVER, COLO., July 13, 1899.

TESTIMONY OF MR. HARRY A. LEE,

Commissioner of Mines, Colorado.

The subcommission on mining being in session, Representative Bell presiding, Mr. Harry A. Lee was introduced as a witness and, being duly sworn, testified as follows, the topical plan of inquiry on mining being followed:

Q. (By Mr. RATCHFORD.) Will you kindly state your full name, address, and present occupation?—A. Harry A. Lee; commissioner of mines is my present title; address, State Capitol building.

Q. And your residence?—A. My home address is 1255 Lafayette street, Denver.

Q. How long have you served in that position?—A. I am on my fifth year.

Q. Have you a force of subordinate inspectors under you?—A. I have two.

Q. Two for the whole State of Colorado?—A. Yes.

Q. How many mines have you to inspect in the State?—A. I have never been able to get around yet, so it is pretty hard to state.

Q. Never been able to get around yet?—A. There is enough work in the Cripple Creek district alone to keep all of us at work constantly.

Q. Do you believe your force is adequate to properly inspect the mines?—A. No.

Q. As a result the men, I presume, are compelled to work in bad air, in some cases, are they not?—A. In some cases they are. I might say in that connection that our best ventilated mines are the mines operated by the large companies; that the greatest amount of work in our department comes from the lessees, the men who are working for themselves, and for that reason often refuse to permit official interference—the old miners that claim the right to destroy their lives with that work if they desire.

Q. But would not do that for anyone else?—A. Not one minute.

Q. What were you engaged in prior to the time of your appointment as mine inspector?—A. Just prior to that I was in charge of a lot of the big mines in Leadville. I believe we had about eleven hundred men on our roll at the time I was in charge of the properties there.

Q. Is there any probability of your force being increased so as to meet the requirements of your State?—A. Well, I hope so. I believe the completing of a department like the one we have here must be considered sooner or later. It has been turned down for a number of years by the action of our general assemblies. The greatest trouble we have had heretofore has been the fact that the representatives coming from agricultural and horticultural districts all hang together with the representatives coming from the centers where the State institutions are, and our mining men as a rule become stagnated. The hardest committee to get together in the legislature is the committee on mines and mining. Why it is I don't know, but I know from my own experience that it is so. I managed during the last general assembly, out of a joint committee of twenty, after drumming them up for three days to get nine together, and that is the largest number I believe we ever did get together.

Q. How long were you engaged in the business of managing mines?—A. I have been engaged in that business the most of the time for 20 years in this State, in various sections.

Q. Have you any interest in mine management or mining industry at the present time?—A. No. I should qualify that a little. I have some mining interests, but at the present time they are, and have been for some time, dead, or at least resting.

Q. Take up the topical plan of inquiry and glance over the questions of part 1.—A. I don't believe there is anything in the first 5 that I can say anything about. I know nothing of the trade unions, either as to their organization or how they operate or just how strong they are.

Q. Number 6, enumeration of the several causes leading up to strikes?—A. I should answer that by saying, agitation in the main. I am speaking now particularly from the standpoint of metalliferous mines. That is about all I have been connected with.

Q. You have had strikes in that branch of the industry, have you not?—A. Yes.

Q. Have you had any strikes against reductions in wages?—A. We had strikes against reduction in 1893 in Leadville, at the time of the crash there.

Q. Have you had any strikes for increased wages since?—A. I have not been connected with the mines since the strikes.

Q. Have you had any strikes since then, that you can remember of, for the improvement of the conditions of the laboring man; any strikes coming under your supervision as inspector of mines?—A. No; not under my supervision.

Q. Then the only strike you can point directly to is the strike against reduction of wages?—A. Well, we might call that a strike. At the time of the fall in silver in 1893 a number of the large mines in Leadville found it impossible to bring the balance out on the right side of the ledger after paying the wages. There was a strike against a reduction of the rate of wages, and considerable agitation against a compromise or settlement. It finally resulted in an agreement between the mine managers and the different labor organizations on a reduction of from \$3 per day to \$2.50 per day for the miner until the market price of silver was \$0.8250, since which time the market price of silver has never reached that point. At that time there was considerable agitation against accepting the scale, but they prevailed, and the mines were operated under that basis, and in time it all settled down. The next trouble came up in the Cripple Creek district when they made a strike for a reduction of hours. That resulted in almost civil

war in the State, and a victory for the miners. The next strike was in Leadville, a strike by the miners' union, demanding that all men underground should be paid the same rate of wages. The management of the property held that a miner was in a great sense skilled labor and should be paid more than the so-called trammer or man who did the shoveling and pushed the car, and that is where the strike started, and eventually ended in a great strike and a great loss to the State and everyone connected with it.

Q. Going back to the first strike, the first stages of that strike—I understand the nature of it, as explained by you, was the fear of a reduction in wages?—A. No; it was a demand for an increase in wages for the trammers, for the same amount that the miners were getting, which was denied.

Q. You made mention of a reduction in wages back in 1893. The first stages of that strike were what?—A. You could hardly call that a strike. As I stated, when silver dropped to 60 cents we simply closed the mines. Then it resulted in our offering the men \$2.50 per day, instead of \$3, which they had been getting, until silver should reach 85 cents. They refused that at first, and we finally compromised at 82½ cents—as soon as the market price of silver was 82½ cents. Now, there is one point about that that might be mentioned. After the winning of the strike in Leadville, that is, to pay \$3 men \$2.50, a great many miners left there, left the Leadville camp and went to Cripple Creek. Whenever the mines in Leadville could possibly afford it and were able to pay their miners \$3 per day, there was no strike for restoration, no demand made for restoration; it was made voluntarily upon the part of the operators, because they found it necessary to do it in order to keep skilled labor. They raised the wages of the miners, restored the old wage scale, just as soon as they were possibly able to do so throughout the mines; but the wages of the trammers, the laborers you might say, remained as they were, and that led up to the final Leadville strike, because the unions demanded that these men be paid the same as the skilled labor.

Q. If the operators of Leadville could afford to pay \$3 per day, after making the compromise of \$2.50, could they not as well afford to pay it then, even though their miners remained there and were not compelled to find employment elsewhere at better wages? The point I want to bring out plainly is: What had the fact to do with the increase of wages in Leadville that miners could get employment elsewhere?—A. If I understand your question rightly, you want to know why they increased the wages voluntarily?

Q. Yes.—A. As I stated, it was in order to keep skilled labor.

Q. Then why did they reduce it?—A. Because they were compelled by the fall in silver to do so.

Q. Did the conditions change?—A. Yes.

Q. Why did the price of wages not change?—A. They did change right along.

Q. But you have stated that the cause of the change was due to the fact that the men of Leadville were able to find better wages in another field, and left Leadville?—A. Yes, many of them did.

Q. And that the Leadville managers raised the price of wages as an inducement to keep them there?—A. Yes.

Q. If that was it, then why not have raised the wages simultaneously with the advance in price; can you explain that?

Q. (By Representative BELL.) What Mr. Ratchford suggests is this: You say that the operators were compelled to reduce the wages to \$2.50 by reason of the great fall of silver; you follow that by saying that many of the skilled men were not willing to work for that and being able to find a better wage in Cripple Creek went there; then you say that the operators at Leadville were compelled to raise the wage in order to get skilled men. Now Mr. Ratchford asks you, if they were compelled to raise the wage in order to get skilled men, did the fall in silver really require them to reduce the wages?—A. Yes, at that time it did. I believe now I understand the question. Up to the time of the crash in 1893 the mine operations had been conducted along certain lines; we had certain economical conditions that entered into mining at certain places for several years; there was so much for transportation of ores, so much for treatment, and when the drop in silver took place in 1893 to 60 cents, there was a readjustment all along the line.

Q. At the time they started to work at reduced wages, \$2.50, the readjustment had not been made as fully as it was made later when new contracts were entered into and new rates made. It made a reduction all along the line and when it was raised it was raised voluntarily. It was not taken as voluntary, however, but to keep the skilled labor, and upon the ground that they could afford it at that time, but at the time of the reduction they could not afford it.

Q. (By Mr. RATCHFORD.) I have understood, and I believe justly so, that you stated as the sole cause of the advance of \$2.50 to \$3 per day the fact that the

skilled men were leaving Leadville?—A. Yes, that is what I believe to be the case.

Q. Now, then, if the companies could afford to raise wages under that condition, could they not afford to raise them even though these men had not left Leadville?—A. Yes, after the new condition of affairs came around they could; prior to that, no.

Q. Could they do it at the same time it took place if these men had remained in Leadville?—A. No.

Q. Do you believe, as a business proposition, it was policy for them to increase wages there in order to keep skilled men?—A. After the readjustment, yes. I was handling at that time at one place an average of 3,900 tons per day at a profit of 30 cents. With the closest margin we could handle that we could not pay \$3 per day, but we got contracts whereby we got a little less freight rate and a little less for treatment, and it immediately went back to the labor; but prior to that it would simply mean a loss of from 7 to 9 cents on every ton of it we touched.

Q. That readjustment enabled the mining companies to pay that advanced price?—A. Yes.

Q. If that be the case, that the readjustment enabled them to pay the advanced price and they were willing to pay it, then the payment of it was not due to the fact that the men were migrating to other districts?—A. I think so.

Q. You think that is the chief cause?—A. I think that is the chief cause.

Q. Then if the men had not migrated to the other district they would have received this additional 50 cents per day?—A. No, because they were not worth it.

Q. (By Mr. KENNEDY.) You stated that in the main the cause of the strikes has been the agitator. I would like to ask you if you had it in your mind to speak disparagingly of the so-called agitator?—A. My experience has been such from early life. I have very little sympathy with him.

Q. I would like to ask you if nearly all social, political, and religious reforms have not been brought about by agitators—men who have stepped out from other places and whom those derelict in their duty brand as pernicious agitators?—A. Yes, that is largely so; but I think there is a distinction between the industrial question and other questions.

Q. Were these men put forward as the representatives of these organizations? Did they speak by authority, these men whom you call agitators?—A. Yes, I guess they did. They represented their organizations and their organizations followed them in the compromise that was finally made.

Q. (By Representative BELL.) You spoke of the men migrating to Cripple Creek. What was the condition at that time in Cripple Creek that enabled mine owners in that camp to pay \$3 when you could pay \$2.50?—A. It was their product that enabled them to do it.

Q. What was their product?—A. Gold.

Q. And yours was silver?—A. Yes. I may say in that connection that I am perfectly willing to go on record about this matter. At the time of the starting, you may say, of the Leadville strike, I went to Leadville and interviewed some 300 or 400 men as to their desire to strike, or not to strike. Out of this 400 men there were less than 3 per cent not in favor of going right back to work and not having a strike. That was less than 3 out of 100 in favor of the strike. Now I may say in all fairness that my investigation might not have been an absolutely fair one, for the reason that my acquaintance with the men was, of course, among the most conservative men, men of families who owned houses, and who had been there a number of years. These were the men whom I knew and these were the men to whom I talked. My object in talking to them was to ascertain whether or not the majority or at least a large portion of them were in favor of going on a strike or whether they were in favor of going back to work and helping to stop the strike. I satisfied myself on that score fully. They were simply forced into the strike by intimidation; coerced by threats; and there was then and there is to-day a holy horror among the miners of being called a scab.

Q. (By Mr. RATCHFORD.) Do you feel satisfied that in that connection you made as fair a canvass as could be made under such circumstances?—A. As I qualified myself, I am.

Q. And you found there was only 3 per cent of them, or thereabouts, in favor of going on a strike?—A. Yes.

Q. Have you any idea and can you conceive of any idea by which 3 per cent could intimidate or coerce 97 per cent?—A. Yes; but I don't know how.

Q. I asked you if you could conceive of it?—A. I know it. I can not conceive of it.

Q. Can you explain it?—A. No, I can not.

Q. Simply make the general proposition that it is true?—A. It is true. I could

relate an instance to you in early life that might throw some light upon that subject, and which is apropos of this, and in regard to labor along the same lines—in regard to the coal district of southern Illinois. I entered the mines under a tutelage quite young. We had 3 men whom, as a boy, I worshiped. They were at all times alive to the interests of their fellow-men and at all times working for their benefit. In time I passed through the mine, up through the engine room and into the office. After serving there for some time I was placed in charge of the books, and much to my consternation I there found that my idols were on the annual pay roll of the company; and whenever the docks were full and the cars were full, and the market was short, these gentlemen were called for, for some reason or another, and there would be a strike there for some supposed injury, and when we got the yards cleared and ready to go ahead again the strike would be called off. There were 3 men and they were not 3 per cent, but they managed them for 3 years without their knowledge. As to the miners here, I don't know. I only speak from my investigation. I only speak from those I talked with as to what they believed and wanted to do; I only know from what they told me; but I talked with them and not more than 3 per cent of them desired to stand out and make a strike.

Q. Were those men in Illinois you referred to as being on the pay roll of the company—were they advocates of strikes?—A. That depended upon what the company wanted with them. They were laborers in the organizations.

Q. The company does not pay their men to advocate strikes?—A. We paid them.

Q. In Illinois?—A. Yes; we paid them so much a year.

Q. They got their salary right along to advocate strikes?—A. Yes; when it was necessary. If we wanted to close down and wanted some excuse to close down, they supplied it.

Q. Is it not a fact that whenever a mining company wants to close its works, it does so without the excuse of anybody, as a general rule?—A. I believe they have that right and they generally do it.

Q. And the public concedes them that right?—A. Yes.

Q. Is it not a fact that the men whom you referred to as being on the pay rolls of the company for which you worked in Illinois were paid a consideration to keep down strikes rather than advocate them?—A. You can take either horn of the dilemma.

Q. But I want you to refer to it.—A. They were paid to advocate strikes and to keep down strikes. They were paid to control the men working in the mines.

Q. To control the men?—A. Yes.

Q. You have found that to be the case in Illinois. Were the 3 per cent of the miners you spoke of in Leadville, who were in favor of the strikes, were they on the pay roll of the company? You are in a position to answer that, are you?—A. No, they were not.

Q. That is one case in which men advocating strikes were not paid to do it?—A. Yes.

Q. (By Mr. KENNEDY.) Do you know they were not on the pay roll of the company?—A. I know they were not on the pay roll of the company for that purpose. They were not there in that capacity—to control the men.

Q. (By Mr. RATCHFORD.) Nor did they receive any money from the company for doing it?—A. No; none whatever.

Q. No. 7: Economic results of strikes and lockouts.—A. I should say the economic results of strikes and lockouts to workers, to employees, and to the community at large are very bad. Every one suffers.

Q. No one, according to that, is the beneficiary?—A. No; I don't know of one who is the beneficiary.

Q. Have you ever known strikes to bring about increased wages?—A. Yes.

Q. Then the men who received the increased wages were benefited, were they not?—A. Well, that is a question I am not clear on. In a general way, yes.

Q. As to the methods of strikes, what are the methods usually employed?—A. Well, I don't know that I can define them. The boycott I only know of in a general way. I have heard it has been employed in the State in a good many places, but I know nothing of it personally. The blacklist is something I have never seen. I understand it is claimed that employers of labor carry a blacklist and it is passed around among them, and that when a man is placed upon it that man is under a ban, but I know nothing about it from my own experience. I know nothing of boycotting or patrolling or anything of that kind.

Q. How are the strikes conducted; that is to say, are they conducted in a legal manner, and how are they supported, etc.?—A. As a rule the strikes of Colorado have been in the incentive quite orderly, and have only become violent after they have gone some time, and, I might say in all justice, go too far—both capital and

labor—in their declarations and intentions. They usually come out and go through the form of making requests and demands which are denied, and propositions are made back and forth until the matter is finally adjusted.

Q. Compulsory arbitration; what have you to say on that topic?—A. I am very much opposed to anything of that kind personally. I believe these questions should be settled between employer and employee. I believe that when the individual or corporation invests its money in an enterprise that gives employment to labor and differences arise, that the men employed and the man who has his money at stake, are in a better position to come to an understanding than a third party can decide the matter. As I understand arbitration, it is where it is referred to three parties practically disinterested, at least one of them; you might say the majority of the arbitration board is supposed to be disinterested; and their finding is final, and it is the highest court to which one can go. I simply reason all of these things from a personal standpoint. If I had \$1,000,000 invested and could not get along with the employees I would not want Mr. A, Mr. B, or Mr. C, who have no interest whatever in my investment, mining or anything, to come in and decide for me what I had to do.

Q. Have you had any experience in that connection, in the conducting of strikes?—A. No, I have not had any experience.

Q. The question of wages, No. 13?—A. The general rule in metaliferous mines is the monthly pay roll. I find in traveling over the State that it differs a good deal in various localities. In some districts they pay the Saturday nearest the 1st that would sometimes come on the 5th or 6th of the month, but as a rule it would be the Saturday nearest the 1st. As they can not pay before the last day of the month they sometimes pay on the 1st or 2d, which can not be over a week away. In other districts they pay on the 15th. But there is no fixed rule regarding it. It is a matter of agreement between the employer and employee, and I think in some districts works a disadvantage to the employee. In some places they practically carry and operate the mine upon the employees' capital for 25 days.

Q. Do you believe the employee should receive his money more than once each month?—A. No; I believe it is better for him that he receive it but once each month.

Q. Do you believe it should be in cash?—A. Cash or its equivalent. I mean by that a check or anything they can turn into cash.

Q. You don't mean store orders?—A. No; I don't mean store orders.

Q. No. 14; time-work, where men work by the day or by the month?—A. Well, time-work in the metalliferous mines of the State has been variable. The average time taken throughout the State until the past 2 years has been 10 hours for a day's work in the day time and 9 hours at night, and ever since 1879, so far as my knowledge goes, the time of the shift is largely made by the character of the work upon which the men are employed. In fact, never have I known of men working in wet, deep mines to exceed 8 hours, and there never was any distinction made in the amount of wages, whether the men worked 8 hours or 10, because if he worked 10 hours it was assumed that he was in good ground, and if he worked 8 hours that it was in wet ground or bad places, or that he was working in a drift or in some place like that where it was desirable that the work should be pushed very rapidly.

Q. In all cases are the employees paid by the day in metalliferous mines?—A. Not at all. A large amount of it is contract work—that is, they are paid by the foot for drifting and by the fathom for sloping.

Q. I mean the miners who are actually mining the ore; they are paid by the day, are they?—A. No; not altogether. In some of the mines they measure the ore by the cube and move it by the fathom or by contract at so much per fathom. The general system of breaking ore is by the day's wages. Drifting depends largely upon the kind of ground to be developed, but I think it is safe to say that by piecework or contract work the men work different hours; they are largely their own bosses, and I have known quite a number of them to work 12 hours.

Q. For the same rate of wages?—A. Well, they work by contract and make according to the amount of ground they break. The general custom of overtime in the mines has been time and one-half, so far as I know, although I am not quite clear on that—that is, for each hour worked overtime the man is allowed an hour and a half. Taskwork, as I understand it, is the same as what we define as piecework. I know of no sliding scale, if I understand it properly, in metalliferous mines.

Q. (By Representative BELL.) What is the standard of living among the miners at the present time?—A. Well, our miners get various prices. The average price in the State to-day is \$2.50 for the cheapest work; but nearly every camp in the State has local control of that. Now we will go to the trammers, being the

ones the unions in Leadville demanded should be paid as much as the miners. I know of only one district in the entire State where the trammers are paid as much as the miners, and in that place they are paid more. The miners get \$2.50 and the trammers \$2.75; but in nearly all of the large mines, the extensive working mines with big ore bodies, the miners, I believe, get \$3 per day whether they work 8 hours or 10 hours; and I presume that could be fixed as the standard wage, the standard of living. It would be an average of about \$2.75, taking it all around.

Q. (By Mr. RATCHFORD.) Store orders and payment in kind?—A. I don't know of any that have been used in metalliferous mining. I understand some of the coal mines use the scrip, but as to that I am not conversant.

Q. Fines and penalties.—A. I presume under that head hospital fines or assessments might come in—also insurance. Quite a number of the men are insured in both. They insure, as a whole, to indemnify themselves against accidents, and they insure the men and the mine thereby, at from 75 cents to \$1 per month apiece. In case they are hurt while at work, the man hurt is taken care of during his accident and draws half pay for the period of 26 weeks or something of that kind; I don't remember just what the insurance contracts are. Where they carry indemnifying insurance themselves that is a matter with the men and the insurance company; but where the mine insures them you can call that a fine, I suppose. Now, in the San Juan country this fine or assessment is largely in doctors' and hospital fees; they have very little insurance there.

There are very few mines, that is metalliferous mines, in which any charge is made for tenements. There may possibly be a few, but as a rule a man can either go to the boarding house or if there are tenement houses he can go there; and there are but few of the metalliferous mines that have tenement houses where there is any charge made for them.

Q. Relative rates of wages.—A. In mining there is not much difference in wages now from 1880. The only difference that I can recall now, if any, is, I believe, I paid men for mining in 1880 \$3 per day, and in the same sections where I operated then the men now get \$3 per day, and \$2.60, and \$2.40, something like that, and pay their board out of it. They can either board themselves or board at the company's house; it is optional with them.

Q. The difference from 1880 and the present time would be 50 cents per day and board?—A. Yes; 50 cents and board. A man who was getting \$3 per day and board in 1880 was really getting \$4 per day, because they could not get board at less than \$1 a day at that time.

Q. They got that as compared with \$2.50 or \$3 per day now?—A. Yes; according to the district they are in.

Q. As to the relative social condition of labor, is their social condition reduced or does it become inferior in proportion to their reduction of wages generally?—A. Well, I don't know that it has. There is quite a marked change from the personnel of the men working in the metalliferous mines 20 years ago to those of to-day. Twenty years ago the men working in the mines were largely of a high intellectual order, and a great many of them were college graduates who were out rustling for themselves and trying to make a fortune. I think it is safe to say that at that time 80 per cent were of that class of people—I mean in 1880. I remember in the winter of 1881 and 1882 I was working 26 men—had that number on the pay roll—and 19 of them were college graduates, graduates of either Yale or Harvard. I simply mention that to illustrate the class of men we had at that time. Since then the mines have developed largely and a great many more men are now employed, who if they have any ambition above the per diem they receive they do not indicate it. You can divide the metalliferous miners into two classes, the miner who is perfectly satisfied with his living and the per diem he is getting and the miner who has his prospect over the mountain and mines by the day for the purpose of getting enough money to develop his property. You can take the two classes and find a different set of men in each. One is of the lower order, you might say, in the scale of civilization.

Q. Do I understand that the social condition has not improved?—A. I think it has improved materially. The social surroundings are better. They have better chances for development if they choose to employ them.

Q. How do you account for the improvement in view of the fact that such a large per cent of the men 20 years ago were educated men, as compared with the number employed now?—A. Why, the mining camps were comparatively new. There were no churches, and homes were comparatively new, and the only places of natural resort were the saloons; the only places they could go to were the saloons and hotels.

Q. (By Representative BELL.) What is the purchasing power of the day's wages

now in Ouray, where you operated in 1880?—A. I was in Gunnison County in 1880.

Q. What was the comparative purchasing power of \$4 in 1880 to \$2.50 now, as to the necessities of life?—A. I would say that \$4 then would not get as much as \$1.50 would now. Everything, of course, was very high then. Those were the days of stage coaches and freighting by teams. In some things it is pretty hard to answer the question. For instance, in Gothic that year I paid 15 cents a pound for oats, 50 cents a pound for bacon, and 10 cents a pound for flour, and \$4 did not go very far—a man could not get anything to eat.

Q. (By Mr. RATCHFORD.) While the purchasing power of the money may have increased to a very great extent, it is also true that the opportunities to spend money to-day are far greater—there are more things to buy?—A. I have never seen any charity or want in the State until now.

Q. Take 24—increase or decrease in number employed, etc.; what have you to say on that topic?—A. I think our employees, in the main, are gradually increasing all the time. Compared with the mines 4 years ago, the tendency has been generally toward an increase. The excess of employees, I think, is largely in the centers—that is, the large camps and the cities. There are comparatively few men in the ordinary mining camps who have not been able to obtain work if they absolutely wanted it. Of course there are men there who have for years claimed they could not obtain work, and yet while they were unable to get work, as they claimed, an entire stranger would come in from somewhere else and get work the next day.

Q. The number of employees is greater now than at any other time in your State, is it?—A. Outside of last year, yes.

Q. They find constant employment?—A. Yes; I think the number constantly employed was greater last year than at any time in the history of the State. I mean running right straight through. We have a large amount of labor in the State done by parties whom you would not call laboring men, who do assessment work on their own claims.

Q. What you would call temporary employment?—A. Yes; in a way. In my office there are 4 clerks; they are going out next week to work their assessments; they will be about 30 days, and it runs that way all over the State—doctors, lawyers, and all the professions. The men take their vacation by going out and working their assessments, so as to comply with the law. I don't suppose they do very much, but they hold their claims in working their assessments, and spend their time in working on the claims, and it is classed as work. They have to keep a record of it. Taking the men who are employed and who are on the pay roll month in and month out, I believe there were more men employed last year than at any other time in the history of the State. Cripple Creek, of course, has the largest per cent employed, but there are a good many employed at Aspen, and Leadville, and over in the San Juan country.

Q. Do they find permanent employment?—A. Yes, most of them do.

Q. The number employed was greater last year than at any other time in the history of the State?—A. Yes.

Q. Were there not miners, who depend upon mining exclusively for a livelihood, out of employment in your State last year?—A. I think so, yes.

Q. Will you state to the commission the percentage of that class, compared with the whole, approximately?—A. I don't believe I could. I don't believe there are many but what could get employment. I think the employment is there.

Q. They don't get it.—A. As I said a short time ago, why some men apparently seek work and don't get it I don't understand. Another man, a stranger, comes in the meantime and gets work the next day after he arrives. I don't understand it, unless it is that these men are constitutionally opposed to it and don't really want it.

Q. Well, the fact that they go to seek it is evidence that they want it, is it not?—A. Not fully, no.

Q. Unless they should be offered it and refuse to take it?—A. I will give you an illustration: a man came to me while I was working the property at Leadville and said, "Mr. Lee, I don't suppose you could put a fellow on, could you?" Now, there is a man who is looking for work, and there is an implied request, but I think, and have always felt and believed, that he would have been disappointed if I had said yes.

Q. Do you attribute that to an inherent desire upon the part of that man to continue in idleness, or do you attribute any part of it to his lack of knowledge of how to address a man in your position, or any other cause?—A. I have never been able to determine that.

Q. I ask you now as a general proposition—men who follow mining, especially

in the Western country, I believe, are not of the most highly educated class of workmen; in metaliferous mines, in all of the mines of the Western country, where school facilities are not as good as they are in other States?—A. School facilities have cut very little figure with the education of our miners of the present day. Nearly all miners of the present day in Colorado are imported. They come here from the Eastern States. I presume you will find boys of 22 or 23 years of age now beginning to take up the helm, and after a while we will have the Colorado product.

Q. If a miner seeks employment he endeavors to make himself plainly understood and without familiarity?—A. Yes.

Q. If he asks, "Mr. Lee, have you a job for me?" in so many words, or, "Mr. Lee, can you give me a job?" or, "Mr. Lee, I don't suppose you could put me on, could you?" It simply means the same thing to him, but to a man in your position it may seem vastly different?—A. It is vastly different.

Q. Are you of the belief that if a man is asking for a job, and it had the same meaning, that he ought to put it in a particular way in order to be denied work?—A. As I have said, I have never been able to determine that. I have followed it closely. Some men actually put it in that way because they don't wish work. Others put it in the same way, and, of course, were denied, although they were really good workers, and really wanted work, and really needed it. But I think that where most men don't get employment it is very likely due to the way in which they ask for it. Of course, if a man has a family and is absolutely needy and wants work, and shows a willingness to work, he is given a preference over anyone else. His conduct, in a manner, identifies him, and it is easy to see that he is needy and feels needy and will work; so we do business in that way. I know of a few cases where we have worked an injustice, where men really needed work, and it was denied because they did not explain their position; but in many, many cases I know the men would have been very much disappointed if I had said, "Yes; come to work in the morning."

Q. Do you know of any reason, if a man comes and asks for work, why he should want to be denied; what object could he have?—A. As the boys say, he has to make a showing that he has tried to get work. If he does not make a showing, the boarding boss might put him out, and the boys would refuse to lend him money.

Q. Could he not make that showing without going to you, without asking for work? Could he not go fishing, for instance, and say, "I have seen the bosses and they refuse me."—A. Good many of them do fish.

Q. A man that could do that is capable of lying, is he not?—A. Yes.

Q. The shorter workday, No. 29.—A. I should say it would be very hard to do justice by establishing a workday. There are some places where I believe it would be better for the men to work 10 hours; there are other places where I think 6 hours is enough for them to work, and I don't think it is good for either the men or the employers for the legislature to make it a certain, fixed time. A good many factors enter into these things.

Q. Are there any places in your State where they work 6 hours?—A. We very often work men 6 hours in an uprise, drift, or something of that kind. I have worked men 4 hours and paid them for the day. That would be where the water was dripping down. There has always been a disposition on the part of the employers to work men shorter hours in these cases and pay them accordingly. I don't know of a instance where that has not been the case.

Q. Have you any mines operated on the cooperative plan in your State?—A. I don't know of one.

Q. Thirty-seven; sufficiency of public school facilities in the several States and Territories.—A. I think the school facilities are ample; and the public school instruction is sufficient for all the necessary wants.

Q. Within your State?—A. Yes. We pride ourselves, I believe, on having the best school system of any State in the Union for the size; whether we are entitled to that or not, I can not say, but we believe it.

Q. (By Mr. KENNEDY.) Have you manual training schools?—A. We have one very good one here.

Q. Is that the only one in the State?—A. I am not positive whether they have one at Pueblo or not. They talked of starting one there, but I am not positive. This is the only one I have any knowledge of.

Public libraries exist in a great many towns throughout the State; of course they are small in places and especially in the mining camps, but you would be surprised if you were to visit them and could only see the character of the reading rooms and the libraries they have there. You go to a mine where they are away up in the mountains, away from the center, and there is scarcely a political party which is not represented there; and they have, especially, such magazines as the

Forum, Review, and that class of literature. I believe, in proportion to the people in the mining districts, as compared with other communities, that the subscriptions to the Congressional Record are larger in number than in almost any other place. And they are not glanced at and left unread, but they are read. A man living up in the mountains has nothing to do but work, eat, sleep, and read. He reads one thing and another, but when he is through with a paper it is read. Of course a man may be 2 weeks getting his mail, but when he gets it he reads it.

Q. You stated that your inspection force was inadequate. Please state what appropriation the State legislature gives you for your work.—A. The total appropriation is \$30,000 for two years.

Q. How much of that is salaries?—A. Well, the salaries and expenses use all of that but \$2,000, and that \$2,000 is a thousand dollars each year for the incidental expenses of the office; that is, \$9,000 a year for salaries and traveling expenses.

Q. Do you make investigations upon complaint of the employees and the employers too?—A. Yes.

Q. From whom do you receive the largest number of complaints, employees or employers?—A. The largest number comes from discharged employees.

Q. (By Mr. RATCHFORD.) You have no complaint whatever from the employers, do you, as to the condition of the mine?—A. No. We are, as a rule, invited to investigate. We are very often invited by the employers to consult with them in an advisory manner, and we are always requested to come in any time.

Q. You have a larger number of legitimate complaints than you can attend to?—A. No; we have been able to comply with the complaints filed so far; but it is detrimental, because it keeps us jumping from one side of the State to the other. In other words, you might say we are hitting the highest places; that is, where the complaints are the most bitter, so that it keeps us going all of the time. If we were adequately equipped to investigate we could take a mining district and go through it systematically and find out how it was getting along. As it is now, we might work in one district a week and then have to jump over to some other part of the State. That is where it hurts us in trying to do systematic work.

Q. Have you ever received anonymous complaints and given them attention?—A. No. We have received a good many that were signed, but I found out afterwards that the men who signed them or whose names were signed to them, did not exist. And unless they are signed apparently in good faith we pay no attention to them. I am sorry to say that upon investigation we find that most of those who make complaint have a spite at the mine because they have been discharged. On the other hand, we get a good many good, valid complaints from miners who have families who are endangered; and we appreciate those very much, and we protect them in making the report to us, for if they were known to have made the report they claim their position would be sacrificed. But whether that is so or not we protect them and make all changes that may be necessary to make. But the majority of them, as I say, are made because of spite.

Q. Don't you believe if the employees in the mines were permitted to make anonymous complaints, you would, perhaps, have more calls than you now have?—A. I don't know how that would work. It is merely a matter of supposition.

Q. The impression must not be left on the record unless correct that the inspection department shall wait in any case until the employees make complaint?—A. I hope such an impression will not be left, because our men are in the field constantly; they are in the field all of the time.

Q. How many additional inspectors, in your judgment, should be added to your present force?—A. Well, if we had sufficient special inspectors for looking into casualties and thus permitting the men to go right through the State and finish a county when in that county, I think probably four more inspectors would keep things moving right along. The point is this: If we have, under our present law, an inspector working in Gilpin County up north, and an accident happens in San Juan County down in the southwest, and if it is an aggravated case, the inspector has to leave Gilpin County and go a day-and-a-half ride to San Juan County. He may work there a week and then have to go to Cripple Creek. You can see he will be spending from half to three-quarters of his time in traveling, whereas if we had a man appointed in San Juan County to investigate that accident there so that the man in Gilpin County could remain there and finish his investigation in that county, it would be an entire saving of the railroad travel and the cost of sleeping car and other expenses of traveling. I think 4 more men would keep things in good shape for a number of years.

Q. Part II—as to capital employed. Take the first subject—capital invested during the past 50 years?—A. There has been more money expended than has been taken out of the mines of Colorado in the past 50 years. As an abstract proposition, the mines have cost more than they have produced.

Q. Do I understand that it has cost more money to produce the minerals of Colorado than the market value of those minerals; more than the amount that they have brought to the men who have produced them?—A. I would amend that a little: There has been more money expended in searching for and extracting the precious metals of Colorado than has been extracted from the ground.

Q. Do you make that as a broad proposition?—A. Yes. I could make figures here in 20 minutes that would scare you, and substantiate that, too.

Q. It has been stated before this commission that the mining industry is a more profitable industry than other lines of business in your State. It is difficult to harmonize your statement with that.—A. I think not; I think it will come up presently from the questions; I don't believe they are incompatible at all. The amount of money expended in mining is spent in a way that you can not count the cost of production until it is expended; that is to say, you can not count it up against the production until it is expended. Thousands of people who engage in the business are money out, while others, who reduce it to an absolute mathematical proposition, are not out much money expended in search of the metal. The thousands of failures operate to make a balance. I believe that in small mercantile establishments the percentage balances better than in almost any other line, but mining is far ahead of it. You will find camps where there is very little mining done—a good deal of prospecting done and a great deal of gambling done; but there is a vast difference between these and camps where there is a large production of metal. You must take into consideration also the vast amount of money spent in search of these metals. Cripple Creek is doubtless one of the greatest mining camps in the world; there is no disputing it; but I will venture to say that there has been more money spent there than has ever been extracted from it. The money spent everywhere, in small camps and large, in searching for the metal—prospecting, gambling in stocks, etc.—must all be taken into consideration and balanced against the great producing mines.

Q. The money spent in prospecting is included in your statement as an expenditure in mining?—A. Yes; I don't see how you can leave it out. If you want to prospect and hire one or two or ten men to work for, say, 30 days each year, you would not put that money in unless you expected to get something out of it.

Q. Then that brings us to the plain proposition that, according to your statement, a very large amount is to be considered as being expended in the development of your mines by parties who have never done any mining, unless you include in that term the search for the metals?—A. Yes.

Q. How does the investment pay, as compared with other lines of business, turning our attention to those who are actually engaged in it?—A. I think it is paying more than other lines of business where the capital is sufficient to go right along and not be stopped by adversity. We have men in this State, for instance, who keep a crowd of men in the field all the time looking for mines and for new camps, and they assume that if they get one good mine out of 10 it is a paying proposition. They will take 10 properties and expend \$25,000 or \$50,000 on them. They may get nothing out of nine of them, but if they get their money back out of the tenth one they generally get much more back than the amount expended on all of them; for if they get a mine at all it is apt to be a good one, and the amount taken out of it is counted against the amount expended in searching for those that might not pay anything.

Q. Forty-seven; taxation.—A. Well, our taxation law here is evaded a great deal on mines; but it is an imposition to a great extent, and I think that is the main cause of the evasion of it. The production of the metalliferous mine is taxed a certain per cent of its gross value. Now if they are working all right and producing one grade of ore, a high grade, it is all right; but when you come to get a low grade, with the cost of milling, it is a worthless product to start with, and the gross value will run it up until you get nothing out of it, and of course there is a loss even without counting the cost of concentrating. Now you put that into dollars and cents and fix the tax on the gross valuation and I don't see where the justice comes in, and that is where the evasion is largely made in fixing the gross valuation. In dealing on one production I have managed to get the absolute production of the finished product. I have also managed to get them divided into kinds with the absolute understanding and agreement that it would not be used as individual ground of complaint.

Q. (By Representative BELL.) Is there not a small tax upon the ground?—A. No. Surface improvements are taxed, but where the improvements are small it practically amounts to a tax on the land itself.

Q. Yes, and ordinary prospects, while idle, are also taxed, are they not?—A. Not unless patented. If a prospect is patented it usually has some small improvement on it sufficient to get the patent, which easily keeps it under the rule as to

improvements, and if it is lying idle the tax is simply on the improvements. That improvement may be a little hole in the ground or a shack of some kind that is not worth anything. Our tax laws are not what they should be in that respect.

Q. What would you suggest as a remedy for that?—A. I am very much in favor of the Mexican law.

Q. What is that?—A. In the first place you don't own anything in Mexico. It is owned by the Government, and you have a right to so much ground, the size of which would be in the neighborhood of half of one of our mining claims, and you pay to the Government \$10 per year for it, and in addition to that you pay a tax on the output, which is a tax on the claim itself. And when you fail to pay your taxes on the land it reverts to the Government and is open to relocation.

Q. (By Mr. RATCHFORD.) Take up No. 49, discriminations in freight rates; effects of, on capital, on labor and on localities.—A. I can say in regard to the discrimination of freight rates, I believe the Smith-Moffatt combination is probably the largest. They were probably the largest operators, at the time I was there in Leadville, in the State, and the claim was made that they got rebates, but I don't know whether there was anything in it or not; I know I did not get them.

Q. You know of none in the State?—A. I know of none, only by report.

Q. Closing of mines in localities; causes, natural and artificial?—A. There are a great many mines now closed down, but it is generally believed to be only temporary.

Q. (By Representative BELL.) What is the cause of the recent closing?—A. It is the 8-hour law, as to how they shall work, and what their future course will be, together with the shutting down of the smelters, affording a poor market.

Q. Are the smelters that have shut down recently combination smelters or individual ones?—A. They are what are designated as the trust smelters. They are combination smelters that have shut down; there is no question about that.

Q. What is the condition of the individual smelters; are they running?—A. Yes, the Guggenheim smelter is running.

Q. If these smelters were not in the so-called trust would they, in your judgment, be shut down to-day?—A. Not all of them; some of them would.

Q. What effect, then, does the combination of these smelters, in your judgment, have upon mining, beneficial or otherwise?—A. At the present time it is detrimental in the main, but I believe it will be beneficial.

Q. Do you mean that it could be made beneficial, or that it will be made beneficial?—A. It will be.

Q. Has not the combination the power to shut down the mining industry largely at any time, just by the will of the management?—A. Yes, but I don't believe such will be the case. I don't believe the amount of money involved in smelting could afford to allow it.

Q. Is it not possible that the combination can shut down the Durango smelter and not injure the company at all by running their ore to the Denver, Pueblo, or Leadville plants?—A. Yes, it is possible.

Q. What effect would that have upon the miners at Silverton?—A. It would increase the tariff on their ore very materially. It would not help them.

Q. Is not such a course always possible, if not probable, if the committee found it to the interests of the combination to shut down a plant here and there?—A. It is possible, but in this case I hardly think it is probable.

Q. What is the custom of employees around smelters, as to buying lots and building little houses?—A. A great many at and around the smelters build houses. Very often the companies have houses.

Q. Has it not been the custom of smelter workmen to become a part of the institution itself and build little homes with the intention of remaining permanently?—A. Yes.

Q. Now what effect would the permanent closing down of a smelter like Durango have on the smelter men who have built the homes?—A. Temporarily it would be disastrous.

Q. Would it not break up their homes if they had to go elsewhere to follow their avocation?—A. Yes, if no other smelter went in there. I think in the case pointed out another smelter would be there very quickly.

Q. Have you kept up with the other great trust machinery, like refining sugar and oil, where they have gone into the combinations?—A. Only in a general way.

Q. Is it not the fact that they generally dismantle their refineries in the smaller towns and outlying points and go to the great centers?—A. Yes.

Q. Does that affect or retard the progress of the smaller places?—A. It retards them.

Q. Does it not always have a tendency to congest the population in great centers?—A. Yes.

Q. Do you think that would be beneficial to the main industry or the general prosperity of the people?—A. It would be detrimental if crowded out along that line. When they concentrate or, in other words, put their forces in a common center, I should say it would be very detrimental.

Q. In speaking of the combination of these smelters I got the impression that you thought it would be really beneficial to mining?—A. I do.

Q. For what reason?—A. The reason is this: They changed their mill ore in the last 10 years. For a certain class of ore they have charged a very high rate, and other classes of ore have demanded a premium. The competition between the various plants has brought about this condition. The premium on the good fluxing ores was more than added to the undesirable ores. Now, in the combination you do away with it and you have a distributing point whereby a large plant can have the good ores taken from one plant to another, and in that way there will be a reduction in the treatment charge of the ore to the individual.

Q. Well, in a case like the present, where they have shut down the trust smelters, is it not possible for the organization to divert the ores from New Mexico, Idaho, and surrounding territory to Omaha and Salt Lake City and smelt them there, whereas they formerly came here?—A. It is possible, but I don't think it is probable.

Q. Well, the manager of the combination, the local manager, said to us yesterday that they have sent out about 300 tons daily from here. Is that a detriment or a benefit to the industries of the State?—A. It is detrimental to the industrial condition.

Q. Is it not possible, if not probable, that these things may go on—has it not been your experience that wherever a great power is in charge in a State, either with labor organizations or with organizations of capital, if not controlled, it is unfavorable to business?—A. Yes. Now, I have answered your question assuming one thing and that is this: Under our present conditions I don't believe these conditions are possible, for the reason that we have two trusts instead of one. The Guggenheim trust is the larger of the two.

Q. It is running, is it not?—A. Yes; but they can afford to run. They have more money, and it is a bigger institution than all of this combine or so-called trust put together.

Q. Then one trust is liable to destroy another?—A. The competition there is the life of trade. If they should go in together it might be very disastrous. Mr. Guggenheim has practically controlled the situation in this State for 2 years.

Q. Where does his combination reach to?—A. Mexico. They have 3 smelters and refineries—1 at Trenton, N. J.—and they have the biggest plant in the State here. I believe the capital back of their smelters is something around 125 millions, and the other people only claim to have about 85 millions; and, as I say, the Guggenheim people have had control of the situation for 2 years, and in the last 18 months have paid more for ore in Pueblo than they have got out of it. They have paid more in Pueblo than they can get in New York. This forced these other people into the position they are in.

Q. (By Mr. KENNEDY.) Is his incorporation under the laws of the State of New Jersey?—A. I don't know.

Q. (By Mr. RATCHFORD.) When an organization of this kind gets into trouble with its men, are they not liable to shut down all the plants in this State where the trouble occurs, and run them in other places where they have no trouble as to labor, in order to make the men come to terms—is not that a power that would naturally be used?—A. It might be true.

Q. Is it your judgment that this is a dangerous power to place in the hands of any combination?—A. Well, I would not consider the smelting of ores with any other industry. This is an industry, a business with too much money involved in it, and they can not come to the large centers, but must be at certain points; they can not get away from them because transportation on ores is such a great item that they must be where the ore is, and then there is a limit to reduction in transportation. Here we have the valuable product and the conditions that are most favorable, and we can produce it and put it down in the general centers better than it can be done anywhere else. If they were all one, all went together in a trust—in other words, became one trust—out of the money they have at their back they would have the ore producers in their grasp, and of course they could run or not just as they pleased, and it would probably result in local capital here putting in a smelter of its own. I don't expect to see these things, because there is too much money involved, and the smelters must be where the product of ore is. The transportation charges will not admit of their being elsewhere.

Q. But it is possible?—A. Yes; but I don't think it is probable.

Q. And they can hold that power over their employees and over the mining

industry if they see fit?—A. Yes; they can, if you put it in that sense; but I don't believe it is probable that they will.

Q. (By Mr. KENNEDY.) Is the Guggenheim concern a trust in the usual acceptance of the term? Did he form a company and purchase a lot of smelters throughout the State, or did he build them up himself?—A. He built them himself. It is not a trust in the common acceptance or understanding of what a trust is. They are a large family, a very wealthy family, and they have been building up their industry a long time. They don't have to come into this combine. In fact, they are bigger than the combine; they have more money. Mr. Guggenheim's enjoyment and ambition in life is to be the philanthropist of America.

Q. (By Mr. RATCHFORD.) Do I understand you to state that this firm of Guggenheims paid more for their raw material here than they received for the finished product in New York?—A. For a portion of it—the lead ores. It is very easy in smelting. If I pay you \$10 per ton more than the metal in the ore is worth and then charge \$15 per ton more than I am entitled to charge, I would be coming out pretty nearly even on the deal.

Q. Admitting that each buyer is a consumer.—A. No; he is simply to me the same as you are. You are selling lead ore for which I pay you \$10 more than it is worth. Each buyer is selling siliceous ore, which I treat at \$15 more than it is worth; you get \$10 more than you are entitled to and I am charging \$15 more than I am entitled to, and the balance of \$5 is in my favor.

Q. (By Representative BELL.) I understand that Mr. Guggenheim pays this price in order to get the lead for the fluxing and in order that he may supply his customers?—A. Yes. The lead is essential for the treatment of the ores, and that is why it is always at a premium. They have to have it in the fluxing, and if they can divert it around into the different plants, then instead of A, B, and C having to pay \$15 per ton or \$20 per ton for treatment, they can divert that right into the smelter and cut the price for treatment down to a third or a fourth. Lead has always been at a premium since 1881 and 1882, and it has always brought as much in the ore as it is worth in the foreign markets or in New York, and not in proportion to the business in which it is used—in the smelting. There is always a big demand for lead ores to use in fluxing the other ores. The Omaha, and in fact most of the smelters, get their lead from the Cœur d'Alenes or did up to the time of the trouble at Wardner. That is a feature in smelting; they have to have it in the fluxing.

Q. By controlling the lead production they practically control the smelting?—A. Yes.

Q. Because the other companies can not get the fluxes?—A. Yes.

Q. (By Mr. RATCHFORD.) If he controls the lead product why is it that he sells the finished product in New York at such prices as you have stated?—A. The market controls the finished product. He only controls the producing end, and he makes it up by his charges. The man with the siliceous ore has to pay that premium. The smelter is not out anything. He takes so much lead ore to treat so much siliceous ore. Now he pays a premium for the lead ore and charges a big treatment price for the siliceous ore to make it come out even. So far as the smelters are in competition, one with the other, none of them could compete for the lead product because he controls it, but there was enough ore scattered about that if they could get it together and under one management they could divert 10 or 15 cars from one plant to another and thus keep the scale of prices down to the standard point. There is scarcely 6 months in the year, for the past 10 years, that there has not been a change of the price of treatment of ores in Colorado. For a part of the time the lead mines panned out well and the operators gave the siliceous mines the benefit of it and dropped the cost of treatment. It has been up and down all the time.

Q. You believe by reason of his large capital he is able to exercise an advantage over the smaller smelters?—A. Yes.

Q. You stated, in speaking of competition between these people, that the smelting industry differed from other industries?—A. Yes.

Q. Is competition more fierce between them?—A. No; the investment in plants is more extensive and the cost of maintenance is greater. The amount of money invested is much larger. The amount of money necessary to furnish equipment runs from a million to a million and a half dollars. You have that much lying there.

Q. But the number engaged in the business is far less than in any other lines of business?—A. Yes.

Q. Can you state whether there is any other line of investment in which there is less competition than there is among the smelter people?—A. Well, I don't know that I can. The trades are very well distributed now in competing for business.

Q. By reason of their smelter trust would it not seem that competition between them would be less fierce than it would in industries in which greater numbers are engaged?—A. I might say that from the way business has been here for the past six or eight years none of them have made any money. They have not paid any dividends, although the claim is that they make thousands and millions of dollars. I have had the opportunity of seeing their books and I know that they have not paid any dividends. The competition has been fierce enough to run the business down to where they have not made anything. Of course they have made money at some of the plants but it has been at the sacrifice of some of the others.

Q. (By Representative BELL.) Is it not the understanding that the Grant smelter largely controls the lead product of Idaho?—A. I think so.

Q. And Guggenheim the other lead product; and, as I understand your point, the other individual smelters have had to use lead, and they are practically helpless?—A. Yes.

Q. And you think that by reason of that, the combination of all the individual smelters with the Grant smelter will give them the lead as well as Guggenheim?—A. It will be one combination against the other. The smelters that are combined can offset the advantages of the other plant, which, as individuals, they would not have been able to do.

Q. What effect does concentration and consolidation have upon wages of employees?—A. Well, the history of combinations on a large scale, I think, shows that they have been detrimental to wages.

Q. You think they have been?—A. I think so.

Q. Have you any suggestions to make as to the regulation of these great combinations by law, so that they may not oppress this great army of employees?—A. No, I don't believe that I have. It is a great question and one that I don't feel competent to pass upon.

Q. What do you think of the advisability of a few inspectors to see that they don't impose upon the public, the same as the Government has for the national banks?—A. I think it would be a good law.

Q. What is your idea as to having investigation into and the limitation of the so-called watering stock?—A. I would be favorable to that.

Q. You don't believe that any artificial person created by the State for the benefit of the people of the State should have its stock inflated, do you?—A. No; I am opposed to it.

Q. And your judgment is that it should be limited by law?—A. Yes.

Q. No. 54; the effects of machinery on prices, etc.?—A. In connection with metalliferous mining improved machinery has been very beneficial. It has increased the production very materially, and it has given employment to a great many more men. It has also made his employment, his labor, lighter, especially in the hoisting plants, and it has had the effect of making profitable a great many low grades of ore that were formerly unprofitable and unworthy of treatment.

Q. Is there any mining industry, gold, silver, lead, copper, zinc, cinnabar, or any other of these metals, that is producing a supply that is beyond the demand?—A. No; not that I know of.

Q. There is a demand for all the minerals produced in Colorado?—A. I think so. There certainly is for the gold.

Q. And your silver market is active?—A. Yes; and copper has been very active. Copper is very high. Lead is higher than it has been since 1878.

Q. Productive capacity of the latest mining machinery as compared with machinery 10 and 20 years ago; effect on cost of output and on overproduction—has there been any considerable improvement in the past 20 years?—A. I can say that Colorado has practically only commenced to mine; that within the past 5 years worthless ores have been worked to a profit, and are being worked to a profit now. The future possibilities can only be conjectured. It is largely due to science and the application of economical plants. Electricity in Colorado has advanced very materially. Colorado claims the honor of having the first plant that has demonstrated electrical results that were claimed by the leading electrical engineers to be impossible. I am speaking of the plant at Telluride. It was claimed that at that altitude it could not be accomplished, that it would be worthless, but the men in charge nevertheless went ahead and spent \$20,000 or \$30,000 for the different apparatus to transmit the power, and now they are running the mills there at an altitude of 10,000 feet by electricity, and to a great advantage.

Q. What have you to say of the extension of foreign markets, possibilities and methods?—A. I have looked some into that subject, but have not made a special study of it. I believe the time is not far distant when this section of the country

will furnish all the steel and iron used west of us, and that we are just opening upon a great era.

Q. How is the mining industry for steel and iron?—A. It is, as we would say, on the bum. It is very high.

Q. Are you familiar with the steel and iron plant at Pueblo?—A. Yes; I have been through it a number of times.

Q. About what is the extent of that?—A. I don't recollect just what it is, although I have it in my office. They have been adding a great deal of modern machinery there in the last year. They turn out steel rails, nails, plates, railroad spikes, and that class of material.

Q. Do you know the number of men that work in that plant when it is running at full capacity?—A. No. It would merely be a guess on my part.

Q. What is the character of the labor, black or white?—A. In certain portions it is nearly all black.

Q. Do you know where this colored labor came from?—A. Alabama largely. The last time I was there they were working about the furnaces. That is where they use the colored help largely.

Q. Do you know how they came to import that labor?—A. No.

Q. But you know it was imported?—A. Yes.

Q. (By Mr. KENNEDY.) Is the mining industry in a very prosperous condition in Colorado to-day?—A. No.

Q. No more than it has been?—A. Not so much as it has been in the last 2 years. It has dropped off very materially in the last 30 days.

Q. What is the general outlook?—A. The general outlook, if it had not been for the strikes, was for the most successful year in the history of the State.

Q. Do you not think there would have been a realization of that prospect if the labor troubles had not occurred?—A. I do. In fact, there is no doubt about it at all.

Q. Don't you believe, then, in view of the prosperous outlook, that labor was justified in asking for an increase of wages, the increase that came with the reduction in hours, because it was an increase if they received the same pay for 8 hours that they had formerly received for 10 hours. Don't you think in view of the bright prospect that they were justified?—A. It is costing everyone too much money, and I do not think it should have come around in that way. I believe in high wages but I don't like to see the advance come in that way. I was opposed to this 8-hour bill in the legislature, and when it came to the judicial committee I opposed it on the ground of its unconstitutionality; but they would not listen to it.

Q. Was it not the natural time for the employees to look for an increase, when there were such bright prospects in the industries of the State?—A. While the prospect in some places merited this increase, it is hard to make a law of this kind that would not hurt. The question was not one-sided, because when you take out 20 per cent to put on the men's wages by reducing his hours it comes off the producer of the ore. Then if the smelter adds 20 per cent to his wages, where does that come from? It comes from the man who produces the ore. He has to make that up and he gets a great big cut in the price for his ore. In other words, the producer of the ore gets it on both ends of the string, and there are so many of our mines working so close to the red line in the ledger that when they pay the expense of mining they have very little left, and if there is any reduction in the price paid for their ores everything would come out on the wrong side of the ledger. If all the mines in Colorado were like the Portland, the Independence, the Welden, or Smuggler-Union, or Tom Boy, then I would have absolutely no fear of the 8-hour law. The amount of money paid by them for labor is a mere bagatelle compared with the amount of money produced by the mines. But with some of the mines it is all they can do to get along at all, and this change would have a tendency to discourage the development of the mines, and the development of the country would be stopped in that way.

Q. Before this bright prospect came about the employers were paying the present scale, were they not?—A. There has been practically no difference in the scale in the State.

Q. You don't suppose they were paying that at a loss, do you?—A. Some of them were. It is only temporary where they have been doing that. Some of the mines I have in mind now are not doing anything. I should say there are 10,000 men out of employment here at the present time, pending the settlement of this controversy. I think that is a conservative estimate, not including the smelter employees. I am speaking about the mining districts.

Q. Your opinion is that they were not justified in calling for 10-hour pay for 8-hour work?—A. Yes; they would come to that when the mines are developed. That is one of the things that is very hard to explain. At Aspen, on these big mines, when they are developed to a certain point they come to 8 hours. They

will all come to 8 hours as soon as they can, but there is a time when they can not do it, and that time is the present with a good many of them. Now when a mine gets to a certain point, where they are able to take out \$10,000 or \$15,000 a month, and their operating expenses are such as to leave them a large margin, they cut the shift to 8 hours. But they have to reach that point where their operating expenses and their output will allow them to do that, otherwise they can not run at any profit.

Q. Is the difficulty now so much in the mines as it is in the smelters in regard to the wages for hours?—A. I don't think so. It is largely in the smelters, and I think if the matter had been left alone the smelters would have been able to adjust their difficulties with the men, and I know that they would in the mines.

Q. What do you mean by "left alone?"—A. If there had been no law passed—if there had been no agitation about it—there is no reason why the smelters should be shut down now. The time for the trouble would have been when the supreme court decided whether this law is constitutional or unconstitutional. It is simply brought about by agitation.

Q. Is not the main cause for the smelters being shut down the fact that certain employers will not recognize the union?—A. I could not say as to that. I think that probably had some influence, but I don't know.

Q. Do you believe that if they could get together on that question the smelters would start up?—A. Yes; if they could get together on it.

Q. And it is a question of the recognition of the union?—A. Yes.

Q. (By Representative BELL.) On page 9, industrial and remedial legislation; employers' liability laws.—A. We have an employers' liability law on the statutes of the State, and I believe under its provisions if a man is hurt in a mine by some mechanical appliance while under the direction and control and operation of the company the company is liable for 5 or 6 thousand dollars' damages; but that the company is not liable if he is hurt through the carelessness of a coemployee.

Q. In other words, it is but a declaration of the common-law principle?—A. Yes. It is made inoperative by amendments enacted into it at the time it was passed.

Q. And the question of contributory negligence always arises?—A. Yes.

Q. And where there is negligence on the part of a coemployee it permits the owner to escape responsibility?—A. Yes.

Q. And if he is hurt by reason of defective machinery then the company is responsible?—A. Yes.

Q. Without contributory negligence?—A. Yes.

Q. What is your suggestion as to an employers' liability law? In other words, do you think it is fair to the employee to say that he shall have no voice in the employment of his coemployee and be held responsible for his negligence?—A. As a moral question I should say no.

Q. Should not the law follow the moral aspect of it?—A. I think so. If it could be framed in such a way that it could not be abused, it should.

Q. Have you any suggestions to make on that subject?—A. I don't think I have. The matter has been fought over three or four times and it seems we can not get at it. There should be a just and equitable distinction between the two.

Q. Has not your failure always been on the idea of excessive damages?—A. Yes, I think it has been.

Q. But you can see no reason why the man who employs all of his laborers should not be responsible for the acts of the agents that he selects himself, in a reasonable degree?—A. Morally he should be.

Q. Well, the law should follow the moral aspect?—A. I know it. But I don't want to pass on the legal part of it. I would want to read the law first in order to justly comprehend it.

Q. What do you say about sanitary and personal safety laws of the State?—A. The last legislature, in regard to metalliferous mining, passed some excellent laws in relation to the sanitary features of mining and the personal safety of the men employed in the mines.

Q. Do you think them sufficient?—A. No; but it is a step in the right direction. We have never had such a law in the State before this. It was simply a custom in each camp that certain things should be done, but this law divides the responsibility to a certain extent. Under the law the operators have to do certain things, and the employees have to do certain things.

Q. No. 64; regarding the employment of children.—A. Employment of children in the mines is prohibited by statute as to all children under 12 years of age.

Q. School laws in the State—I admit with you the superiority of the public-school system, but is it not your opinion that our public schools should be directed more toward manual training and teaching the children the mechanical arts?—A. Yes, most decidedly; the mechanical arts and military discipline.

Q. Don't you think we have neglected that in all States, including our own?—A. Yes.

Q. We try to teach the infant to read and write when he has no interest in the subjects he reads or writes about, when, if we would teach him to farm or instruct him in the mechanical arts, he would become interested in learning to read and write, because he would have something to read and write about?—A. Yes.

Q. You have no convict labor in mining?—A. No. I think we should have to a certain extent, so far as it did not compete with other labor. I think certain classes of labor should be utilized, and the convicts thus made self-supporting to reduce the burdens of taxation to a certain extent. It would be best to have no convict labor come in contact with what we call white labor or free labor.

Q. But it should be used in the places where in the development of the country the ordinary employment would not go?—A. Where it would never enter, yes; for instance, building a tunnel down to the Gunnison River.

Q. That would not be remunerative?—A. Never would be remunerative, but would open up to production a vast area of country.

Q. Would make many new homes?—A. Yes, from 2,500 to 3,000 people could have homes, and probably it would open up a country that will never otherwise be opened up; and it would cost no more to support the convicts in doing that class of work than it costs where they are. And work of that character, that would not compete in any manner with other labor, I am very much in favor of having done by the convicts.

DENVER, COLO., July 14, 1899.

TESTIMONY OF MR. D. C. COATES,

President of the Colorado Federation of Labor.

The subcommission on mining met at 10 a. m., Hon. John C. Bell presiding. Mr. D. C. Coates, being duly sworn, and examined on the topical plan of inquiry on mining, testified as follows:

Q. (By Mr. RATCHFORD.) Please state your name, address, and occupation.—A. David C. Coates; printer; Pueblo, Colo.

Q. Any connection with organized labor?—A. President Federation of Labor of Colorado.

Q. How long have you served in that capacity?—A. In my present position since the 8th day of last June.

Q. And prior to that time?—A. I was secretary of the organization for two years.

Q. Before which time you worked at the printing trade?—A. Yes; and am working at it to-day.

Q. You are working as a printer to-day, are you, in connection with your duties as president of the federation?—A. Yes. I run a little newspaper. The president's position is not a salaried position and consequently I have to work for a livelihood.

Q. How many officers are employed for that organization in this State?—A. There is no one regularly employed. The only man who has a regular salary is the secretary, and he gets \$25 per month for his clerical work. That is the only salaried position. The officers, when required to do work for the federation, receive a per diem of \$3 per day and their expenses.

Q. How old is this organization?—A. It was organized in Pueblo May 1, 1896; a little more than 3 years of age.

Q. What trades does it embrace?—A. All organized labor in the State is eligible to membership in the federation.

Q. Regardless of their calling?—A. Yes. Its scope is to take in all producers of wealth.

Q. What is the strength of the Federation of Labor?—A. It amounted to somewhere in the neighborhood of 15,000 or 16,000 members. That is my recollection.

Q. Would you care to outline the work of that organization, dealing with its constitution and organization, its benefit features, etc.?—A. It is organized of course to bring the wage-earners of this State together for their mutual benefit and protection. The advantages in the way of strike benefits and the benefit of federation and strength are bringing the whole of the wage-earners into one order.

Q. Have you any benefit features?—A. As a federation, no; except that in strikes or anything of that kind we have a system whereby we can levy assessments for benefits upon a referendum vote.

Q. Do the unions affiliated with that federation have that benefit feature?—A. Yes; nearly all of them.

Q. That is, out-of-work benefits?—A. Yes.

Q. Strike benefits?—A. Yes; funeral benefits—there is scarcely a labor organization in this State or the United States practically that does not carry these benefits.

Q. You spoke of the purpose of the federation being to bring the workers closer together. Does the commission understand from that if one or more of the trades affiliated with you are involved in strikes or other labor troubles, the affiliated trades are amenable to assistance?—A. When called upon, yes.

Q. And it must be by referendum vote?—A. Yes. Our constitution in that regard says the executive board has power to levy an assessment not to exceed 10 cents per week for 5 weeks, then we have power to levy a 50-cent assessment if we wish to, but upon that we have to submit it to a referendum vote.

Q. Ten cents per week for 5 weeks?—A. Yes; 50 cents.

Q. Does your executive board often avail itself of that power?—A. Only once in the history of the federation has it been necessary.

Q. What have you to say as to the growth of the federation or the trade unions of your State?—A. Within my knowledge of the last 10 years in this State we have had a continual growth, and we are in a better-organized condition to-day than ever.

Q. What was your membership at the time of the organization?—A. It is very hard to say. I think the unions that were represented in the convention at the first meeting had about 3,000 or 4,000 membership.

Q. Do you find that your organization increases its membership or otherwise during periods of strikes and controversies?—A. It has the effect of increasing, so far as those who are immediately involved in the trouble are concerned, and it has no adverse effect upon the others so far as I can see.

Q. In such cases do the new additions to the organization remain members after the troubles are adjusted?—A. I can only say that a percentage of those who become members during such periods do not understand the organization or the benefits to be derived, and quite a large per cent of those usually drift outside of the organization; on the other hand a good many realize the benefits of organization of labor and stay with it. I find generally that there is an increase.

Q. Speaking in general terms, you have a good healthy growth of trade unions?—A. Yes, especially in Colorado.

Q. What is your opinion as to the incorporation of trade unions?—A. We have not found it necessary to incorporate, and I see no benefit.

Q. Has that question been agitated any in your State?—A. Not that I know of.

Q. What are the relations of your organization to nonunion labor?—A. Our purpose is the complete organization of labor, and every inducement is offered the nonorganized to come within our ranks. It has never been necessary in my experience as an officer of the federation to take any action other than to show the benefits of the organization to bring them within its ranks. Of course the sentiment of trade unionism largely permeates the unorganized, but the fear of losing their positions or being blacklisted keeps a good many out. The blacklist is used very largely in Colorado, or such a large percentage would not remain outside of the organizations.

Q. Is there any intimidation or coercion brought to bear by your organization to bring men into its fold?—A. None whatever.

Q. No threats?—A. No. We have nothing but the benefits to induce them to come in.

Q. In case of a strike, where a part of the men affected belong to the organization and another part do not belong, does the organization control the members and nonmembers?—A. It only controls its members. In case of a strike or intimidation of one, or a condition arising that might result in a strike, the union involved is required by our constitution to give out notice of the same to the executive board, which is required to investigate the matter and bring every possible means to bear for a peaceable settlement; and if it is not adjusted, and it is the desire to continue the strike, we control everything along the policy outlined by the executive board.

Q. And in case part of the men affected by the proposition which may give rise to a strike are nonmembers, do they continue working or do they suspend with your organization?—A. I should say in 99 cases out of 100 they suspend. They see the same causes which compel the others to strike, and while they might be a little timid about joining the organization, when the question comes to strike they nearly always suspend with the others. And when the trouble is adjusted it is generally satisfactory to them.

Q. The adjustment is acceptable to the nonmembers?—A. Yes.

Q. As to the right of liberty of contract, has your organization at any time

denied this right to anyone?—A. It is unusual for a member of organized labor to make a contract. Nearly all the organizations outline or fix the wages that the member shall receive, consequently they act as a body rather than individuals.

Q. We are aware that within the ranks of your organization this question is one that never arises, but among those who are not members it has arisen in some cases, and the commission would like to know the attitude of your organization in such a case. I take it that in some cases nonmembers will negotiate individual contracts. In such instances is your organization silent, or does it bring a moral pressure to bear upon them against making such contracts?—A. Only in the way of trying to induce them to come into the organization.

Q. By moral suasion?—A. Yes. In many of our organizations—in all of them, in fact—there is a scale of wages, but it don't prevent the members from making individual contracts upon the conditions outlined by the organization.

Q. But collective bargaining is your purpose?—A. Yes.

Q. What have you to say as to unskilled labor in the different trades?—A. They compose the great mass who are unorganized, but we are gradually getting these men into the ranks of organized labor, and organized labor in many instances has done most beneficial work in bettering the condition of the unorganized, whether in the organization or not. For instance, there are very few statutes in Colorado in favor of the laboring man but what have been induced by organized labor; such as the 8-hour law and the \$3 pay for common labor.

Q. What class of people go to make up unskilled labor in your State?—A. We have a mixture; all nationalities.

Q. Are they English-speaking people as a rule?—A. The large mass of common labor in this State is composed of Austrians, Swedes, and Italians.

Q. They are known as the non-English-speaking class?—Yes; largely.

Q. As these men become skilled and familiar with our language and our customs and methods of business, do they incline more or less toward the organizations?—A. More. Recently we have organized a number of unions of which probably 90 per cent of the membership is made up of foreign-speaking people.

Q. As to strikes, arbitration, and contract labor; enumeration of the causes leading up to strikes; what have you to say in regard to that?—A. Well, to my mind, the great reason for strikes is the competitive system—the competitive system of doing business, making a continual war between the wage-earner, the producer of wealth, and the employer. The employer is continually striving for profits, and the wage-earner is striving for a greater portion of the share of his product. While this is the underlying cause, there are many other causes that come up and result in a strike. I find recently that it is the tendency to introduce machinery to displace men, thus making two men do three men's work. Such rules and regulations are put upon the men as to economize in the operation of large works and to render greater profits to the owners. On the other hand it is the organization that educates the men to realize that they ought to have a fairer share of their product.

Q. If our competitive system be the underlying cause of strikes, what remedy have you to suggest?—A. The only solution of the warfare between the producer and the nonproducer, or the employer and the wage-earner, is a complete change from the competitive system to the cooperative system, or public ownership—that is, the State placing the means of production and the means of enjoying that production in the hands of the individual citizens. That is largely along the line that organized labor is working. The great principle of organization is to remove the wage-earners from competition with each other, substitute the cooperative system for the competitive system, and remove the wage-earners from the competitive state to the cooperative state.

Q. Is it the purpose of organized labor to eliminate competition so far as employment and wages are concerned and stop there, or do they purpose going further?—A. They go further. There are a good many questions besides wages that enter into the conditions that tend to make the life of the employee more pleasant or more miserable. They have a good many questions to deal with other than wages.

Q. But the elimination of competition as between workingmen in the different States and different industries is one of the main objects?—A. Yes; you might say the principal object.

Q. Now, if competition is eliminated in the market in which laboring men expend their wages for the necessities of life, what do you believe will take its place?—A. I apply the same thing to that as I do to the other—the cooperative system.

Q. The same will be good there?—A. Yes.

Q. What have you to say as to the economic results of strikes and lockouts?—A. I believe they are good to everyone except, possibly, the great capitalists.

Q. Please explain the beneficial results.—A. I believe there have been beneficial results in strikes. It is true that temporarily they bring a cessation of employment and possibly bad conditions for a time, but the ultimate result is good. It has a tendency to increase wages and otherwise better conditions, and make men educated more firmly and clearly as to their position and as to the conditions of their employment.

Q. Does the strike increase wages?—A. In my experience, yes. I think that if it had not been for the strikes of the past, neither organized nor unorganized labor would be receiving the wages that are received to-day.

Q. Strikes usually occur because of the wage difference between the employer and employee?—A. Yes; largely. There are also other conditions. The present strike in Colorado to-day between the smelters and the men, I believe, is largely due to the fact that the men believed that the smelter trust was trying to rob them of the benefits of the new eight-hour law. We got that from the notice that they placed in their works throughout the State a few days previous to the coming into effect of this law, the first paragraph of which had a tendency to lead the men to believe they intended to evade the law and its benefits by offering inducements to work longer than eight hours.

Q. You are speaking of the law recently passed by your legislature?—A. Yes; known as the eight-hour law.

Q. Is that measure responsible for the present strike?—A. No, not the measure, but the refusal of the smelter trust to live up to its provisions and allow its humanitarian effects to become practiced.

Q. Does it apply to all other industries or just to the smelting industry?—A. It applies to mining only—work in underground mines, both metalliferous and coal, and smelters and institutions for the refining and reduction of ores and metals.

Q. Is it generally observed throughout your State?—A. I know of no instance where its observance is not practiced, except in the smelter trust, at the present time, or rather in the smelters of the American Smelting and Refining Company. There was a large percentage of our people—I mean by that, organized labor—who were working 10 hours a day in many mines and mills in this State previous to the coming into effect of this law, but in no instance do I now recall where there has not been a satisfactory arrangement made to carry out the provisions of this law, except in the smelters mentioned.

Q. If the working people of your State to whom that law applies would cease work, for instance, until its terms be complied with, what, in your opinion, would be the effect of such a demand? I mean the entire State, where the law is not observed.—A. I believe it would have the effect of compelling its observance, and consequently would have a beneficial effect upon the workingmen of this State in the way of shortening the hours of their arduous labor, in the way of putting more men to work and giving them more opportunity for education.

Q. Will you explain the advantages of the law in this and in all such cases where laws are enacted intended to bring about certain things, where a strike must be inaugurated in order to have such laws complied with? The law itself is not enough to give the advantage it seeks to give, and unless supplemented by a proper spirit, where is the advantage of such a law?—A. So far as I am personally concerned, I have very little faith in the efficacy of these laws, except where there is an organization to enforce them. I think unless we have an organization behind these laws they are evaded in a thousand and one ways, and consequently the wage-earners and those intended to be benefited by the law lose the benefit.

Q. And if you have such organizations in the absence of laws are you not able to obtain the same results?—A. Yes, and usually better.

Q. What are your methods of strike?—A. They are various.

Q. How are they inaugurated?—A. Of course, the form they go through is just as I have said. When a condition arises that might result in a strike it is discussed by the local unions affected, and by a two-thirds vote the position of the union is declared, and it is then submitted to the executive board of the State federation of labor; and nearly all the local unions belong to the national organization, and it is also submitted to them, and the strike or nonstrike largely results from the position that is taken by the executive board and the executive officers of the national organization.

Q. Is it inaugurated by a two-thirds vote of the membership?—A. Yes, and in some cases by a three-quarters vote.

Q. How is it conducted?—A. There is usually elected what is known as the executive committee, or strike committee of the union, in whose hands are placed all the details of the strike, and they are required to enter into negotiations with the opposing forces and to keep continually getting everything that is new on the situation. Before they can take any final action, however, they are compelled to

report back to the whole body. They have the various strike benefits from their national or State federation that sustains their strike.

Q. Is law and order observed during the strike?—A. Yes; that is the first principle of organized labor.

Q. The leaders advocate it?—A. Yes; always. We realize that in no other way can we be successful.

Q. Is the boycott ever resorted to?—A. Yes.

Q. Why should it be?—A. It is a natural law, I should think. When a man finds someone else is opposing him in his desire to better his condition, and that man runs a store, he refuses to patronize him. He finds he is opposed in a good many ways, and he simply thinks he is doing to others what he thinks they are doing to him.

Q. That is usually known as the boycott in organized circles?—A. Yes; and each union takes notice of it. It can be general or otherwise.

Q. By what terms is it known by others outside of the union; is it known as a boycott?—A. Yes.

Q. Sympathetic boycott?—A. Yes.

Q. You believe it is a natural law?—A. Unquestionably.

Q. (By Representative BELL.) I would like to ask you if there is not a law in this State against boycotting?—A. Yes.

Q. Associated with a law against blacklisting?—A. Yes.

Q. Has it had a tendency to prevent it?—A. I don't believe there has been but one or two attempts by organized labor since the passage of the law to do anything but observe its provisions, and these one or two instances have always been in extreme cases. And I find that the other part of the law has no effect; wage-earners are blacklisted from one end of the State to the other.

Q. Do you make the statement that the blacklist is still used?—A. Yes.

Q. Can you state to the commission the names of any parties who have ever practiced it in violation of law?—A. I can mention names, but I could not prove it. I could mention a good many names, but I could not prove it. I know from my own experience that men are kept from positions in all parts of the State of Colorado because of their connections with organized labor, and yet we have a statute that tends to prevent discrimination because a man belongs to organized labor. In the present instance, in this strike, we have men who are threatened with discharge, even by persons who have but a remote interest in the matter, because of their position with regard to organized labor.

Q. What other methods are employed by either side to influence the results of the strike?—A. Of course, I can not say what the methods are that are used by the capitalist side. They are very secret. That is one advantage they have over us; they have their system perfect, and all of our dealings with a large mass of people don't enable us to have such a perfect system, and largely the methods we use become public; we have to make them public, and we have to depend upon the public sympathy or sentiment; whereas the other side have very great power—the employment or nonemployment of the men. They practically have the power of saying that a man shall not have work; to destroy his credit with the merchants; to destroy or make valueless what little property he has; to separate him from his family and make him a wanderer upon the face of the earth; in fact, they have every power that can be given to man. They compel men to cease their connection with organized labor and to return to work.

Q. Have you had any sympathetic strikes?—A. Not lately. I have not known of any.

Q. The importation of new or foreign labor under contract; have you any instances of that in your State that has come to your notice?—A. Yes, the Colorado Fuel and Iron Company has imported under contract a large number of negroes from the Southern States into their works in the city of Pueblo. They had a large immigration from Missouri into the State during the Leadville trouble in 1896 under contract. There were attempts made to the same end in the northern coal strikes last year.

Q. How recent were these men shipped in that you mentioned first?—A. All these came in within the last 6 years.

Q. When did the last come in?—A. I think the last lot came last fall. They continually come in.

Q. Have you any laws in your State forbidding it?—A. I don't think we have.

Q. Do you care to express an opinion as to the advantages or disadvantages of this practice to your State as a whole?—A. It is detrimental to the State and to the best interests of the State. It is detrimental to these men who are displaced by the importation—men who have been employed in these works and other places or many years and have built up permanent homes, or what they think permanent

homes. As a result of this importation of cheap labor—it is always cheap labor, labor that agrees to accept the terms and conditions of the companies, whatever they may be—they nearly always make provision for the displacing of organized labor, and that means the removal of those men who have been there for years. It is detrimental to the best interests because they have a tendency to reduce wages in all instances. In many cases you will find that men who are willing to be imported to take the place of men who are on strike or otherwise, who are willing to sign these contracts with the companies, are usually the ignorant classes, and they are a detriment to any community into which they come. The condition in our city and county, with which I am more familiar, is such that the county to-day is under a greater expense, in the way of criminal prosecutions and public charity and matters along that line, as a result of the importation of the ignorant, vicious classes, in many instances.

Q. Have you any means of knowing how these men are secured or employed?—

A. Yes. The companies send agents out very often, I believe, or get local agents to employ men; but the best method they find, I believe, is to send a personal representative into these districts and make all kinds of promises.

Q. Go to other States?—A. Yes; and make all kinds of promises. They get hardened to misrepresenting the true condition of affairs in order to induce men who are out of employment to go where there is employment, especially where they assure them of what they call permanent employment. It is only permanent so far as the company can use them, however.

Q. Do you not believe that these men are contracted for outside of their own State?—A. I don't know as to that, but I think the companies write to their locality and make the contract right there.

Q. Wherein does the effect of that system differ from the effects that might be brought about had these men been contracted for in a foreign country, if any?—

A. There is very little difference, only in so far as the men who are contracted for in the United States are usually a little better educated, on a little better plane of intelligence; that is about the only difference.

Q. Are they English-speaking as a rule?—A. No; they are not. There are very few Americans or English-speaking people that you can get to make a contract to take some one else's job.

Q. How can you account for that statement, then, as to their intelligence?—A. What I meant by that is simply this, that the foreign element in the United States have come in contact here with better facilities for education and understanding their relative position as to other wage-earners—better than they do in the foreign countries; consequently they are on a little higher plane of intelligence than the foreign importations.

Q. Have you any trouble in this connection with the colored labor?—A. Yes. There has been such a hue and cry against foreign importation that instead of doing that now the large companies go to the Southern States and get the poor, ignorant negro and are using him for the same purpose as they did the foreign importation.

Q. What remedy would you suggest for this evil?—A. It is very hard to suggest a remedy other than I tried to convey—that is, to remedy the whole condition. A man must live, whether in the South or in the North, and it is very hard to say that any man shall not come into your State; but I believe there ought to be a law passed whereby companies should be prevented from importing men to take the place of strikers.

Q. To make the records clear on that, do you believe that such a law ought or ought not to apply to men who come of their own volition from any other State?—A. No; I would not favor a law preventing anyone from voluntarily coming into the State.

Q. But to prevent those coming under contract?—A. Yes. In any instance where we find a man who is influenced by contract or otherwise he should be prohibited.

Q. As to conciliation, mediation, and arbitration under State law or by joint committees, what is your position upon that subject?—A. They are two great principles of organized labor, conciliation and arbitration, and they are always used in every instance to their fullest extent whenever there is a strike.

Q. Used with good effect and with good results?—A. In fully 75 per cent, and often a larger percentage than that, of the cases. In fact, most of the differences, except where it comes to a great corporation, are settled by arbitration and conciliation between employers and the committees of the men.

Q. Do you believe that arbitration should be compulsory or voluntary?—A. I see very little benefit in voluntary arbitration. It has been used beneficially to a certain extent. Arbitration, in instances, is beneficial. I have not made up my

mind whether I favor compulsory arbitration or not. I don't care to express an opinion. I want to get rid of the whole system that continually makes war between these two forces. But I don't think, so long as the condition exists where arbitration is necessary, that we will get it.

Q. Is the injunction in strikes sometimes resorted to in your State?—A. Yes; and it tends, in nearly every instance where the injunction has been used, to take the little liberty that is left away from the wage-earner. It nearly always makes him powerless and at the mercy of the people who secure the injunction.

Q. For what purpose is the injunction or restraining order usually issued, enjoining men from commission of crime?—A. It is used before he ever thinks of committing any crime. It usually places him in a position where he is branded as a criminal by the injunction.

Q. Is he enjoined from attending meetings or trespassing on certain properties?—A. Yes. During the northern coal strike last winter in the State of Colorado there was an injunction issued to restrain men from congregating in numbers or going on the property of the companies.

Q. Was it an effective remedy?—A. No, not so far as prohibiting meetings was concerned.

Q. No arrests for its violation, that you can recall, or no arraignments?—A. I think not. Of course it was a clear violation, but I don't think anyone went so far as punishing anyone for holding meetings.
